Woodrow Wilson, under these trying conditions, was cheerful, good-natured and unselfish. He went the limit of his endurance, no matter what impossible situation had been created for him, until his frayed nerves had become exposed at the end of a day of constant speaking and cried out for rest. And he looked out constantly for the interests of the other members of his party.

Arriving at a town, the reception committee was on hand, at the rear of the train, to greet the candidate. The police kept a small space cleared for the official welcome. The crowds, enthusiastic to the point of hysteria, pressed forward and clamored for a sight of the Governor. As the party appeared on the rear platform he, of course, came first. He stepped down off the car, the reception committee shook hands and escorted him to an automobile, usually only a few yards away.

*Taking Care of the Newspapermen*

Immediately the police relaxed their vigilance. They, too, wanted to see and pressed forward to be as close to the visitor as possible. They let the crowd close in behind. Reception committee members and other citizens scrambled hastily into the waiting automobiles, and the newspaper reporters, nine times out of ten, found themselves brushed aside, cut off from the Governor, held back by the crowd that had closed in around them.

The local committee chairman would bow the candidate into the first car in line, spring in beside him and give the signal for the procession to start. But it wouldn't start. Mr. Wilson would stand up in the car, which was always open, and look for the other members of his party. He would see them struggling like football players bucking the line, striving vainly to get to the now overflowing automobiles.

"Don't start yet," Mr. Wilson would say to the local chairman. He would speak pleasantly but with a certain air of command that attracted attention, despite the noise, din, confusion, band music, and cheering. "We can't go until the newspapermen are taken care of. Didn't (Concluded on page 20)

(C) *Harris & Ewing.*

President Wilson greeted by admirers as he passed through the west gate of the White House for his daily ride.

# Traveling Around Without a Coat

## A Garment Which Becomes a Symbol of Respectability and Passport to Civilization

By DONALD HOUGH

ILLUSTRATED BY GLENN W. THOMAS

A COAT, you understand, is a symbol.

The Chinese incase long finger nails in gold sheaths, the length of the nails indicating infallibly that the owner is a person above manual labor. We incase the arm and shoulder muscles in a coat to prove that the wearer earns his bread by his brains, his wits, or somebody else's money.

It was only when the doughboys threw their coats away that they gave an account of themselves.

To "take off your coat and go to work" is a standard phrase. "Hold my coat" is the recognized preliminary to strenuous combat.

The term, "keep your shirt on," meaning to remain cool and collected and of gentlemanly temper, is probably descended from a time when there was no discrimination between shirts and coats, just as the worst coat in the world, that used by the Army, is still called a blouse for no reason on earth.

It is noteworthy that our only rigid caste system, the Army, uses the blouse (this being a coat that is very tight fitting) as a distinct symbol. It is in the Army that gentlemen are created by act of Congress, and a gentleman so created may as well leap off the highest available bridge as to appear minus his blouse. Since Congress, having created gentlemen, is obliged to see that they remain gentlemen, rules for wearing the blouse are perhaps more rigid than the rules which govern the shooting of a spy or the capturing of the enemy's citadel.

The odd rules of the Army in respect to maintaining the appearance of respectability were so inflexible that the doughboys went into action in France equipped with the choke collar and bell-boy dignity of the blouse; and it was only when they took matters into their own hands and threw the things away that they gave an account of themselves in action.

I see no harm in admitting that in the Army I was "an officer and a gentleman" and that I successfully defended my commission as second lieutenant against most of the rules designed to keep me "an officer and a gentleman" in spite of my civilian training.

I recall once when we were in camp in New Jersey, and the sun blazed hot all day long. On the occasion of going for a day's march, somebody higher up made the lamentable error of permitting us to become sots and ungentlemanly fellows by leaving our blouses in the barracks. I took advantage of this by taking both of my uniforms to the tailor to have them altered, and wore a spare pair of breeches.

But on returning I found I was officer of the day, in charge of the guard. That an officer on special duty should appear without a blouse, irrespective of the thermometer, was unthinkable. But I had no blouse. The tailor had gone home and my uniforms were locked up. So I had to rush around and buy a new uniform, and the only thing I could get was a heavy wool one.

I put it on, sweltered in it for a few hours, then threw it away.

So much for the Army. When I left it, I thought I had left the edict, "Blouses Will Be Worn," behind me. I had not.

Last spring I went West for the purpose of taking a long trip through the Kaibab forest and adjoining regions on horseback. It was inconvenient for me to take a suit of clothes with me, so I wore my flannel shirt, breeches and boots on the train. Why shouldn't I? Wasn't I going into the West? Had I been going to see the motion pictures all these years for nothing? I knew my stuff.

Came time to eat. In my tragic innocence I went forward to the dining car. The steward welcomed me with a wide smile. Then suddenly the smile became a sickly grin and sank back into his face.

He had observed that I was coatless. "You'll have to get your coat before you can eat," he said, "it's the rules of the company."

I looked through the diner. I saw coats that were much worse looking than my flannel shirt; and I saw some that were shiny at the elbows, and some that I think cost less than my shirt did.

"What kind of a coat must I have?" I asked.

"Any kind," said the steward nervously.

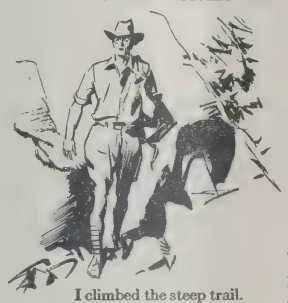
"Could I wear a pink one, or a dirty one, or a coat made of green cheese, or would it have to match my breeches?" I persisted.

"Anything—anything—just so it's a coat." The steward was getting impatient.

"But any kind of a coat with my breeches and boots would look ridiculous. Why must a person have a coat in order to eat?"

Now the steward was on familiar ground. He knew the answer to that one. "It's the rules of the company," he replied.

"In that case, I'll go back to my car," and I turned to leave. But the steward took hold of my sleeve. He looked around apprehensively, as though expecting to see the president of the Union Pacific at his elbow.



He must stand with his back to me at the table.

He hastily ushered me to the nearest seat, in a corner of the car. He covered my entrance as well as he could with his body; and I observed that the waiter who grudgingly attended me stood between me and the passengers of higher caste who owned coats.

During the rest of the trip I was smuggled into this seat as though I had been a shipment of liquor, and it apparently became a standing rule of that diner that whenever a waiter was idle for a moment he must stand with his back to me at my table, thus shielding the other passengers from the sight of a Man Without a Coat.

"I'm afraid you'll have to have a coat before you can eat at the hotel."

I climbed the steep trail.

I reached the Kaibab forest, and for three weeks and more I traveled through and around it with two pack mules, a forest ranger, and without a coat. Then I was invited by the National Park Service to take a ride across the Grand Canyon.

It took us two days to cross the Canyon, and if you have ever crossed it, you know what it is: a hundred in the shade, desert sands and fine trail dust.

We climbed the steep trail, made a few final twists and turns, and in the winking of an eye we were on the rim of the Canyon. And just as suddenly, everything changed. There was the cool hotel, and men, instead of wearing chaps and shirts open at the neck, were wearing straw hats and flannels. We had entered civilization.

I was hungry. I looked at the cool hotel and yearned for a bath and a feed. The park ranger who was with me saw me yearning. He looked at me with an odd expression.

Somehow, I sensed his next question. I sensed it correctly:

"Have you got a coat?"

I looked at him in surprise. "Why," I asked, "would I have a coat? I'm plenty warm now. And where would I pack one if I was encumbered with one?"

"Well," he said, "I'm afraid you'll have to have a coat before you can eat at the hotel."

So that was it. I had to have a coat before I could eat at the hotel.

"It's only recently," the ranger explained, "that you could eat there in anything but dinner clothes."

This floored me. I stopped my horse and looked back at the Canyon. I looked at the forest on the other rim, and at the desert to the east. It was a big country. It was the American West. It was a place for hard riding and harder living, open shirts and perspiration. That is what it was made for.

I wanted to turn around and get back into it, where, coatless, it seemed I belonged. This tiny dot on the rim of the monster Canyon was a place where you couldn't eat without a coat!

I went to the ranger's house and tried on his coat but it wouldn't fit. I was getting hungrier all the time. So I went to the hotel, put on my most brazen expression, rented a room, and outwitted and cheated the rules by having my meals brought to my room where nobody could see me *eating without a coat.*

Came a time when I left the Canyon to continue west by train. I sat in my seat and speculated. Poor West! Trying to mix its drinks! Somebody had thought it would be nice to have things real proper. The clothing standards of smug civilization, where the only things in sight are the works of man and where such standards are decidedly in place, had been removed out into the desert.

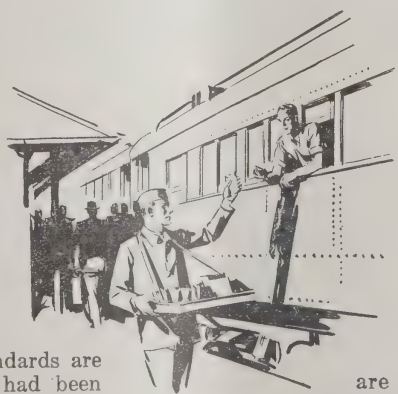
The train I was on was a pitiful little thing crawling over a land that reached to horizons so distant that all its rush and roar was lost by the roadside; and its pitiful whistle, so brave as it reverberated through towns, was a tiny "cheep" that was swallowed up in limitless air.

"Surely," I thought to myself, "I'm all right now. My clothes certainly fit in. At last I'm in the West!"

Why had I been ostracized because I wore no coat? Was it a matter of appearance? I reviewed the scenes in diners and hotels. I had seen ill-fitting coats, cheap coats, worn coats; I had seen them over frayed silk shirts and loud ties; had seen them below unshaven cheeks.

I looked at myself as well as I could. My shirt was clean; it fitted me perfectly; it was of excellent quality. My hat was broad-brimmed to keep the sun away; my breeches were well cut; my boots were shined and had cost me forty-five dollars. I certainly looked better, and I undoubtedly was better dressed for the surroundings, than a great many who owned and wore coats.

Time came for dinner. But I knew my ground now. I was, at last, in the real West. I was far enough West so that flannel shirts were in style.



I swaggered to the diner, met the steward with a smile of understanding, and started to take a seat.

But a troubled frown flitted across the little steward's brow. He looked nervously about as though expecting the president of the road to be at his elbow.

"I'm sorry—" he began.

But he was talking to himself. I had left him.

I hung my head out of the window at the next stop and by shouting with all my might succeeded in rounding up a bag of peanuts. I threw the shucks on the floor.

I rounded up a bag of peanuts.

The long nails of the Chinaman are not so good looking as shorter ones, but they are a symbol. So it is with our coats.

Coats, after all, are nice things. Most men, and all thugs, wear them.

PAUL HONORÉ

## THE FINDING OF THE SPICERIES

*Second of Series*

WHAT we know positively about the early life of Magellan is very little indeed. His biographer, F. H. H. Guillemard, writing in 1890, to whose work later writers are indebted, is obliged to fall back on guesses and suppositions, hanging much upon such pegs as "there is little doubt," or "it may be possible," or "it is reasonable to believe." We do not know the exact date of his birth, though it is placed at about 1480.

The family home was in Sabrosa in the hilly part of Northern Portugal, where, as the saying has it, "it is nine months winter and three months hell." It is supposed that there were six children, though that is not certain. A less important fact has been preserved, which is that the family boasted a coat of arms, described, to use the fantastic language of heraldry, as "on a field argent three bars checky, gules and argent, the crest an eagle, wings displayed." We know also that the lad became a court page when he was about the age of 17, his royal master being nominally Dom Manoel. Of his career at court nothing is known and it is fairly certain that nothing of importance happened to compel attention or remark. To add more than that would be but a mere spinning of words and a waste of time. The only history of his life written by one close to his time was that made by a certain D'Aughiem, which was destroyed during the sack of Rome in 1527.

The important thing to realize is that there was immense activity in Portugal during Magellan's youth. Explorers and adventurers and those sent out by commercial houses had steadily pushed north, south, east and west; as far as Labrador, across to South American coasts, around Africa to India. Greatest weight was given by those at home to discoveries in the East, because new lands meant important advances in national industry and wealth, and because, as will appear a little later, Portugal had unchallenged rights in that direction, that is, unchallenged by Christian nations.

Where discoveries meant no more on the surface than the extension of geographical knowledge, small notice was taken, apparently. That possibly accounts for some fogginess and doubt as to activities south of La Plata. Neither gold nor spices nor silks nor valuable woods were brought back from there, and the explorers seemed to have nothing to report but wild and tangled lands or barren coasts, so what tales they told were heard with indifference. For trade was the thing. But matters eastward were quite another story.

From there came revenue to the crown because of the activities of those merchant princes who compelled attention, even if it was reluctant attention, from those in power. So expedition after expedition was sent to India, culminating in one of a fleet of thirteen ships, and there gradually came the establishment of all those foreign agencies and trading posts of which we learn from the documents of such houses as the Fuggera and the Haros and the Roths.

As might be expected, all that turning of trade into new channels awakened opposition. For up to that time the Moors had enjoyed a monopoly of Indian trade and keenly resented Portuguese activities. Native kings and chieftains found themselves between two fires. There were ruptures, attacks, reprisals. Such fierce fighters as Kheyr-ed-Din, considered as pirates by their opponents but as patriots by their own people, played havoc on the sea. It was the advance of culture and the pursuit of trade, but it was also a sowing of the seeds of war. The closer the relations that were established with native princes, the more vigorous were activities that could mean nothing but bloodshed, as when traders and agents gave concessions and favors to little potentates in return for the privilege of building warehouses and forts. What seemed friendly coöperation at first soon became potential enmity.

Obviously all this legitimate commercial activity had to result in occupation, so Dom Manoel, of Portugal, decided to create a viceroyship for India. Tristan da Cunha, the sturdy explorer, would have had the office had it not been for his failing eyesight. The next in line was one Francisco d'Almeida and he was appointed viceroy. To back established authority, Vasco da Gama, who had found the route to India around Africa, was made Admiral of India, and then commenced the building of a fleet.

It was Portugal's day and her influence was unquestioned. She had unchallenged rights as far as her opponent Spain was concerned, because of a Papal Bull which seemed to concede her all eastern trade. As to this a word is necessary. Pope Alexander VI,

acting as mediator, had awarded all lands to the east of a certain north and south line to Portugal, all west of that line to Spain. A recent writer on this subject says that the Pope "with a ruler drew a line on the map three hundred leagues to the westward of Cape Verde," at random as it were.

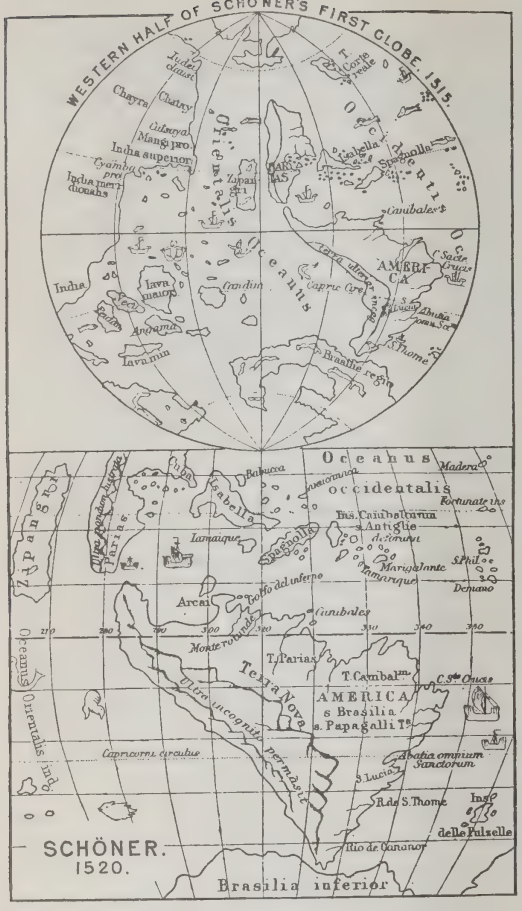
But the line of demarcation was not arrived at in that arbitrary way. It was based upon the discovery of Columbus that at a certain point when crossing the Atlantic the compass pointed due north. That line of no deviation he regarded as a fixed boundary between the Eastern and the Western hemispheres and the reigning Pope accepted the idea. The princes of the church did not officially admit the sphericity of the world. The arrangement was a temporary expedient, nothing more, and on protest there were shiftings of the line, with much subsequent dispute, violent threats, an attempt after a time to settle matters by royal marriages, and, at last, by Spain selling her rights in the Moluccas, long after, for 350,000 ducats. But of that later.

The building of the fleet for service in Indian waters meant tremendous activity. Portugal had what we would call a boom. According to the historian Correa, twenty ships were built, with others going as cargo as nearly ready to set up as possible. It all meant the employment of a little army—shipwrights, carpenters, carriers, teamsters, woodmen, metal workers, sail makers, rope makers, armorers, blacksmiths. Besides these there were, toward the close of the building operations, 1,500 men-at-arms, a couple of hundred bombardiers, four hundred seamen and other supernumeraries, all at hand and ready to sail. The news of extraordinary and important things afoot had spread far, so there flocked to the scene of activity "many hidalgos and cavaliers and people of distinction," as Correa has it.

As the time neared for the fleet's sailing, a tide of patriotic excitement came up and was at its height when the religious ceremony of blessing the flag was held in the Belem cathedral. Correa has a somewhat circumstantial account telling of notabilities clad in rich habits, the royal flag in its splendor of white damask and gold-bordered crimson satin, and similar things, so that with his picture we get other glimpses—the thousand-colored congregation, the robed priests and singers, the royal pages slender and olive-skinned, the steel-clad soldiers, the lights and lofty dim shadows.

Then the people in the open places and in the streets who had come from all quarters: mahogany-faced men all scarred and battered who were not so keen for foreign travel as the youngsters, and who had tales to tell of how six men out of every seven had died from fever, scurvy, shipwreck, or arrow. Some of them had sailed with Columbus; some had been with Ojeda in strange waters; some had been with Goboto to icy Labrador. Others were with Pinzon when his ship sailed on the brown waters of the Amazon, or with Bachelor Enciso the adventurous, or with the veteran Juan de la Cosa, or with the illustrious Nunez who first set eyes on the Southern ocean.

Then came the pageant of the twenty-fifth day of March, 1505, when the armada set sail. On that day the king inspected the fleet amid the beating of drums, blaring of trumpets and a thundering of bombards. There was a great display of soldiery and the yellow Tagus was gay with banner-bearing boats filled with people of high place dressed in gold and scarlet. Those of greater consequence were on board the ships, admiring when the king seemed interested, evolving rhapsodies when diplomacy demanded, pressing at the heels of the royal person with due regard to procedure. And from the shore and across the water rang voices, while the air was



There are pictures that illustrate and pictures that decorate. The above woodcut richly does both. You do not take it in with a fleeting glance; the longer you look at it the more does its wealth of detail and design appear.

Mr. Honore has chosen the moment when Portugal's fleet sailed, with all the color and movement of that event—"the royal flag in its splendor of white damask and gold-bordered crimson satin—the thousand-colored congregation. There was a fine beating of drums and a blaring of trumpets and a thundering of bombards. The yellow Tagus was gay with banner-bearing boats filled with people of high place dressed in gold and scarlet. Along the banks, on walls and towers and roofs of houses were somebodies and nobodies, men-at-arms, citizens, sailors, strangers, priests with banners. In places were ruddy flares from bonfires. For it was a day of wild rejoicing and high hopes and great expectation and Portugal was proud in her glory and strength and power."

So Mr. Honore sets out to chisel all that in a few inches of wood block. In the foreground are the minstrels, viol, horn and drum—nobleman and beggar standing at the right of them. Just beyond the round little kettle drum is the stern of a barge richly draped with silks, a bargeman at the tiller, passengers standing and sitting; near the bow a herald blowing his bannered trumpet, and over all the royal standard in its glory of white damask and crimson satin. In the background the great galleon, sails hoisted, ready to move off on that immortal circumnavigation of the globe. At its feet the little boats. And beyond that the castles and the shore.

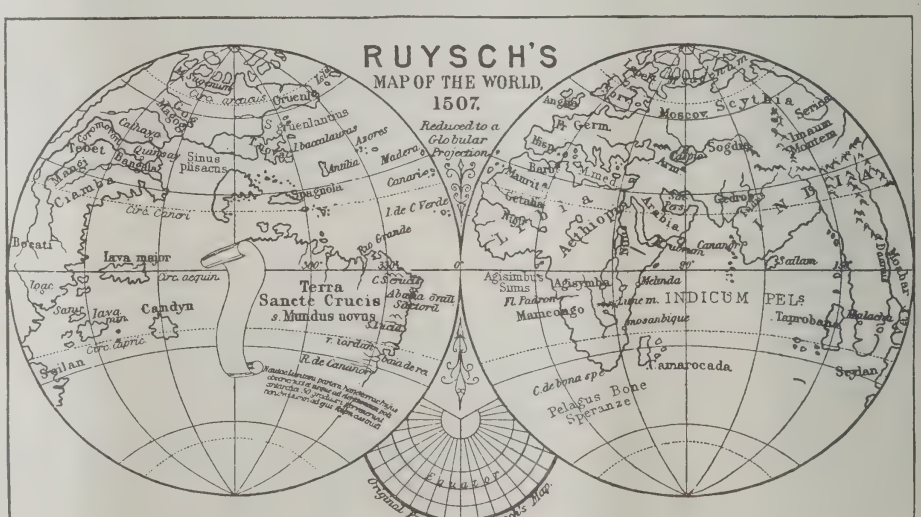
All of this, chiseled into a little block of wood, five by five and three-quarters inches square, is the work of one of the foremost wood block artists in America. We have used several specimens of Mr. Honore's work, and they have attracted wide attention in artistic circles, but this wood block is so specially rich, both as illustration and decoration, that special attention is called to it.

Very rare map made by Schoner, of Nuremburg. His outline of South America shows a strait situated nearly within seven degrees of the correct position, and islands corresponding to the Falklands, which, according to history, were not discovered until 1592.

clamorous with the noise of bells. Along the banks, on walls and on towers and the roofs of houses were somebodies and nobodies, men-at-arms, citizens, sailors, strangers, priests with banners, sight-seers, all vociferous and crowded. In places were ruddy flares from bonfires made by those too inferior to find foothold where they could see the sights—beggars, men with asses and mules, carriers, those with next to nothing.

It was a day of wild rejoicing and high hopes and great expectation and Portugal was proud in her glory and strength and power, feverish for the wealth beyond the seas. Her courtiers dreamed of victory and conquest and place. Her merchant princes thought of well-regulated foreign commerce and the securing of respect abroad, of a new and larger Portugal beyond seas where white men would be masters, the natives slaves, the opposing Moors properly subjugated.

Certainly the old historians, scornful of ignoble commerce and seeing surface indications only, viewed the royal personage as the superior thing. But students of economy with more profound insight saw causes behind, and that deeper vision was well supported when those private papers of the old commercial house were made public. For all that glitter meant, not patriotic activity, but the protectorate accompanying exploitation. It meant the furnishing of strength to those who sought economic privileges, the backing up of trade adventurers who would provide revenue for governmental purposes. The vital interest was not scientific curiosity, not passion for the growth of the Church of Rome, not the glorification of Dom Manoel. The vital interest was commerce and a fostering of the growth of material prosperity. The unseen powers behind the throne were those wealthy gentlemen with a reputation for commercial integrity who could lend millions of ducats to the crown and make no press for a return. For with proper protection they could build that commercial structure which was to enrich the nation. Without that protection the great wealth of India could not be diverted from Moorish lands to Portuguese.



That then was the whirlwind which swept Magellan, with thousands of others into new and strange courses; for he was one of the fleet, no more important than an autumn leaf scurrying before the storm, a mere nobody, so subordinate that no one can say in what capacity he sailed, nor name the ship he sailed in. Yet, on account of his three glowing years later as master of men, also because of that strange habit men have of trying to make a man's entire career pass for heroic if a part of it be brilliant, attempts have been made to connect him with all major operations. A little twist here and a slight wrench there; a "no doubt," or a "it is more than probable," and, by an illusion, wonderful things seem to be done.

To take an illustration, a minor one, F. H. H. Guillemard, quoting Correa very accurately and giving chapter and verse, has a passage telling of the sick men at Mozambique. Here is the passage. "Much did they occupy themselves with the care and healing of the sick, to whom they gave many marmalades and conserves, in the eating of which they were greatly benefited." Now mark how by the change of a word, the turning of the general into the particular, the halo is cast about Magellan so that he becomes an outstanding figure full of ardent and whole-souled devotion to great causes and fine ideals. I quote a modern writer who presents the matter thus: "Magellan took his turn at caring for the sick; marmalade and conserves, it was found, were very helpful in relieving the sufferers." Comment is needless.

The fact is that in Magellan's seven years of India service there is very little on which the finger of certitude can be placed. Certainly he was wounded in a sea fight in 1506. In a skirmish at Malacca in 1509, he was one of a party that rescued a certain Serrao; in 1510 he was on board a ship that shoaled on the Great Padua bank; and, according to a document in the Torre do Tombo at Lisbon, which was translated by Lord Stanley, Magellan was one of a council held at Cochin which was to decide whether the trade ships in the fleet should be used in the siege of Goa or not. Magellan was one of those who held the use of the trade ships as unwise on account of the delay to commerce.

There is one positive date, that of June 12, 1512, when he is again at Lisbon, his service in Indian waters at an end. The documentary proof is in the sixth book of *Mo radias da Casa Real*, folio 47, v., a receipt bearing his signature acknowledging the receipt of his monthly pension of a milreis, about a dollar, with his usual allowance of an alquiere of barley, that is, about twenty-eight pounds. And yet, one historian, Argensola, has it that Magellan was one of those who sailed on an expedition to the island of Banda in the latter part of the year 1511. That effort of Argensola was in the nature of a wrenching of things out of line to make it appear as if, in spite of all, Magellan was the first circumnavigator.

The truth is that there is nothing to distinguish Magellan from his fellows during those seven years. One or two little incidents have been related as tending to show that he did his duty on occasion, but they need not be related here where the

The Ruysch map, 1507, which bears a notation written across that part marked as Santa Cruz Land, to the effect that Portuguese ships had sailed as far south as latitude 50 degrees.

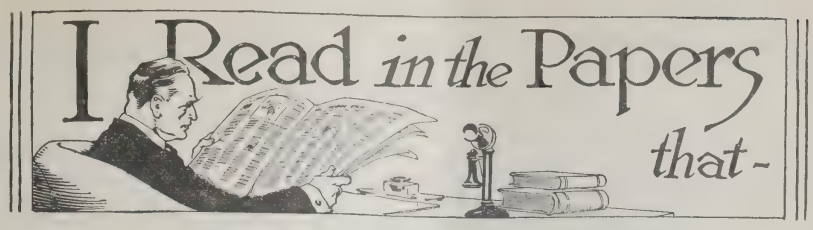
flow of the story would be delayed. In short, Magellan of the India service was obscure. The real man emerges when his life's work commenced, and that work was the discovery and the crossing of the Pacific.

But there are two men almost neglected who had to do with the opening up of those Spice Islands which Magellan went to seek by a westward route. One of them is Varthema, whose name and doings are known only to the specialized student; the other is Francisco Serrao.

Through Varthema, the Portuguese in India learned for the first time of the wealth of the islands in the east. Briefly this was his history. In 1502, he left his native Bologna "to see where places are," and his journey took him through Alexandria to Cairo, presently to Damascus. He learned to speak Arabic and professed conversion to the Mohammedan faith. Then came the holy journey to Mecca. Cast into prison by the Sultan of Yeman, he was in chains for three months, and escaped by feigning madness. By foot, by caravan, by boat he went east, year after year, through Persia, India, Ceylon. Of all the white world he was the first to set foot on the Spice Islands, the first to describe the commercial wealth of Java, Banda, Borneo.

***First European to Hear of Australia***

He was the first European to hear of Australia, a wonderful tale in itself with its Javan skippers and their compasses and their maps. Homeward bound after years, still passing as a Moor, he came to learn of the Portuguese activities in India, also of Moorish activities by which the invaders were to be wiped out. By a clever ruse he made his way to the viceroy at Cochin, evading those of his pretended race. His tale put the Portuguese on their guard; sea forces were organized; a great battle took place and the Moors were defeated.



Through Varthema's description of the far eastern islands trade agencies were established in the unknown lands. The wonderful story of his wanderings has not yet been told, and I reserve it with other matters for later telling.

Francisco Serrao was the first to penetrate into the far east of which Varthema told. His history in a nutshell is this: A captain in the India fleet and, apparently, a close friend of Magellan's, landed in Malacca on September 11, 1509. There are many discrepancies among the old historians, but it is clear enough that in 1512, while sailing among the islands to Ternate, in a ship taken from the enemy, the vessel foundered. Serrao and his shipmates were picked up by one of their own vessels, the *Santa Catalina*, and taken to the island of Banda where they bought a native junk, loaded it with those abundant spices of which Varthema had told, and took the cargo to Malacca. Returning for another cargo he was wrecked in lat. 5° 30′ S. long. 127° 40′ E.

***There Was an Adventure With Pirates***

There was an adventure with pirates and an overcoming of them—another wonderful tale to tell presently—then Serrao forsook civilization, joined hands with a native ruler in Ternate, and lived the life of tropical indolence. To Magellan he wrote letters telling of his new world, "larger and richer than that found by Vasco da Gama," and Magellan replied telling him that he expected to see him in time "if not by Portugal, then by way of Spain." But that letter was written as Magellan was on the verge of his great adventure.

For the tale of that the way is now clear.

arrangements have been made to place a military guard about the Tomb of the Unknown Soldier in Arlington Cemetery in order to prevent casual visitors from leaving lunch refuse and other waste upon the tomb. This guarding of the tomb is the natural reaction of the Government to a shocking situation, but the potential disrespect will remain regardless of the presence of the guard. The guard will merely emphasize the ugly fact that if it were not there the tomb would receive offerings of crumpled paper napkins instead of homage, and every visitor, respectful and disrespectful alike, will realize this state of affairs whenever he visits the tomb.

ɤ ɤ ɤ

in this year of grace, just a century since Charles Lamb was pensioned and left the East India House, in London, the stately old building where the gentle Elia "in the intervals of his clerical labors conceived his imperishable essays," has been pulled down to make way for the new building for Lloyd's. The place is at present a vast excavation, and it appears that, in the making of it, some fourteen feet below the present level of the street, remains of the former Roman occupation were found. Lower down, still, twelve feet of undisturbed "dirt" rested upon fourteen feet of "river gravel." Below that, that is, some forty feet below the street level, is the blue clay, and in this blue clay a human skull was discovered. Scientists are inclined to think, from the exceptional smoothness of this skull and from the faintness of the muscular impressions, that it is that of a woman and that this far distant "Lady of Lloyd's" was left-handed. Professor G. Elliot Smith, a well-known British authority on such questions, comments on the matter, and points out that as the ulna of the woolly rhinoceros was previously found in the same blue clay there can be no doubt of the remote antiquity of the original owner of the skull who was a contemporary of the woolly rhinoceros and the mammoth in what is now the heart of the City of London. It certainly revives, as Professor Smith adds, the fascinating question: "How long has man as a thinking being existed upon the Earth?"

numerous applications for importation of Kosher wine from Palestine were denied by Assistant Secretary Andrews, in charge of prohibition enforcement.

The Associated Press dispatch says: He held that the wine supply in this country is sufficient in quantity and quality for sacramental use.

The applications were received principally from members of the Orthodox Jewish churches, who sought the Palestine wine for use in connection with the feast of the Passover, which starts soon. They pleaded that this wine was more sacred.

ɤ ɤ ɤ

a tragedy of the Revolution has at last been explained by the discovery of a skeleton in a cave near Valley Forge. During the winter camp there, which is pictured as one of intense suffering, a young officer named Carrington was sent out with a foraging party. He never returned, and was finally registered as a deserter, although he was known as a brave officer and devoted patriot. The skeleton clears his name. With it was a story of the party, written by the officer in a letter to his sweetheart, preserved in a bottle. The ink used was his own blood. Cut off from camp by a superior British force, Carrington ordered his men to find hiding places in the caves in the neighborhood, with the hope that some might straggle back to camp when the pursuers retired. Most of the little party were captured, and after vainly seeking others, the British soldiers fired a volley which dislodged a large boulder that blocked the only opening to the cave in which Carrington was hidden. It is only now, a century and a half later, that the tragedy is revealed. Carrington and his fiancée, Miss Randolph, were both of prominent Virginia families.

ɤ ɤ ɤ

Lord Allenby the reconquerer of Bagdad; the conquerer of Jerusalem in the World War and later the overlord of Egypt, who is making a trip around the world, coming from Asia to America, said in Winnipeg:

"There have been reports of Red or Communist influence in the Eastern lands but I saw none of it nor did I learn of any. There will always be local difficulties due to petty jealousies and ambition, but there is no indication of large-sized trouble on the horizon and I do not believe there will be any for a long time."

ɤ ɤ ɤ

the national extension secretary of the Christian Endeavor advocates the installation of courting booths in each new church building. In this way he believes the church will secure a firm hold on the young people. He says: "Young people are going to get together in some way or other and if the church does not supply the means, they will go to the other extreme. They will meet at 2 o'clock in the morning when each of them is supposed to be in bed and the car in the garage, if at no other time." In explaining his idea of a courting booth he said there should be several of them in a large parlor adjacent to the church, all of which could could be seen from the center by a chaperon.

# Is Europe Satisfied With the League?

(Concluded from page 6)

all is the attitude either for or against the League of Nations prevailing in the two principal non-member camps, Germany and Russia. As has been mentioned before, Germany is biding her time and expects soon to become a full-fledged member of the family; but it will not be because there is any large degree of popular ecstacy prompting her to join.

One of the conditions of the Locarno Agreements as stipulated by the Allies was that Germany should be admitted to the League in order to be under common authority. The Germans themselves, however, are still undecided as to whether membership in the League will eventually be a boon or a curse to the country.

*German People Are Still Undecided*

Many thousands of Teutons are of the opinion that Germany's entrance into the society of nations would be a grave risk, to be assumed only if by so doing the rescission of war penalties might be hastened. The opinion is very frequently heard in Germany that the decisions rendered by the League in the past have invariably been influenced by consideration of power rather than of justice.

All classes appear to feel, nevertheless, that as a member of the League Germany's confidence and good will among the nations will be largely restored, and that as a direct result of such confidence Germany may expect to find it easier to obtain continued financial assistance from abroad, thus enabling her to adjust her industries as quickly as possible to post-war conditions. *Many Germans are exceedingly reluctant to incite Russia's displeasure in the East by joining the League,* although they believe it to be equally expedient to retain the favor and friendship of the western powers.

The German Monarchist and Nationalist bodies are the chief opponents of Germany's affiliation with the League because they fail to see where or how the nation will be benefited thereby. In their opinion Germany, as a member of the League, in addition to the obligations already imposed upon her, will then herself be merely a signatory power to the League's decrees, which implies that Germany must pledge herself to aid in the enforcement of any legislation which may in the future be enacted against her own interests. In other words, whether in or out of the League Germany will continue to be "the hound that's kicked around," is the prevailing sentiment from this quarter. And yet in spite of this rather pessimistic view there is no doubt that the German people on the whole are for a League of Nations, although, like other European peoples, they are not overzealous for *the present League,* dominated by England and France and Italy. Their confidence in the present covenant is diffused with a goodly bit of mistrust and skepticism.

*The Soviet Government Is Opposed*

That Germany is completely changing her mind, however, may be gleaned from the fact that less than a year ago scarcely anyone in the country would have believed that the majority of the German Reichstag or Parliament would express itself in favor of Germany joining the League and guaranteeing French frontiers as laid down in the Treaty of Versailles.

Having said this much for Germany, the Russian attitude may be briefly given.

Litwinow, a prominent voice in the Soviet Department of Foreign Affairs, is quoted as having said:

> "The Soviet Government invariably considers the League of Nations an organization not built upon a foundation of mutual friendship between the nations, as should be the case. The League of Nations today is but a masked combine composed of the so-called powers which have assumed for themselves the right of presiding over the destinies of the weaker nations.
>
> "The present League of Nations has not fulfilled the hopes or expectations of its adherents, and it has never protected the rights of the weaker peoples against the arbitrariness of the stronger. The League has never undertaken one serious step to solve the disarmament problem which so vitally concerns the peoples of the Soviet Union and the world at large. The Soviet Republic is strongly opposed to joining such an organization."

In summarizing our observations, then, we are more or less prepared to conclude that although the existing League of Nations appears to enjoy a satisfactory local reputation in certain countries, nowhere is there to be found any considerable degree of popular spontaneity in its favor. While the professional politicians of all nations may continue to deafen the people's ears with their loud admonitions in defense of the League, the people themselves are of the opinion that this is not the boon, nor even an outer door to the boon that humanity seeks.

*Must Be Purged of Its Evil Influences*

If at any time the large and powerful nations shall be called to the bar of judgment and corrected in their activities, the League's prestige and popularity will multiply. Then Europeans would have more of the whole-souled spirit of confidence in its administration. But nothing like that has occurred, nor is it even expected.

The people of Europe will be fully satisfied with the League of Nations only when that potential body has been purged of its evil influences, and when the principles of justice and not those of power and privilege guide the actions of its constituents and leaders.

# Woodrow Wilson, Master of Dreams

(Concluded from page 13)

the National Committee give you the names of my party and request that automobiles be provided for them?"

"Why . . . why . . . why . . . I guess it did," the local chairman would stammer. "But I guess we forgot it . . . I . . . I . . . don't you think they'll follow along?"

"Not unless they have something to follow in," Mr. Wilson would smilingly reply. "You will have to halt the proceedings until they can come too."

The chairman would look at the automobiles, with local enthusiasts hanging onto the running boards.

"I hardly know what to do," he would reply.

"I'll tell you what to do," Mr. Wilson would say. "Get out and have the police clear the crowd back. Then have enough automobile seats vacated to make room for the men with me. I'll wait for you."

*Some of the Party Would Play Poker*

And Governor Wilson would not budge away from the railroad station until his request was complied with. For three months, in nearly every town, the same sort of performance was necessary. At hotels where the party stopped overnight it was sometimes the same way.

Traveling in the evening or on long afternoons, when there were few stops, Mr. Wilson loved to get members of his party about him in the observation parlor and tell stories or discuss the humorous phases of the campaign.

Some members of Mr. Wilson's party were in the habit of playing poker on the dining-room table during long night trips. The Governor occasionally saw them as he passed through the car and joked them at breakfast about their winnings and losses. He never made the slightest objection to the game although he never played himself nor stopped to watch the play. That he understood the fine points of the game, however, was indicated one night toward the end of the return from a western trip.

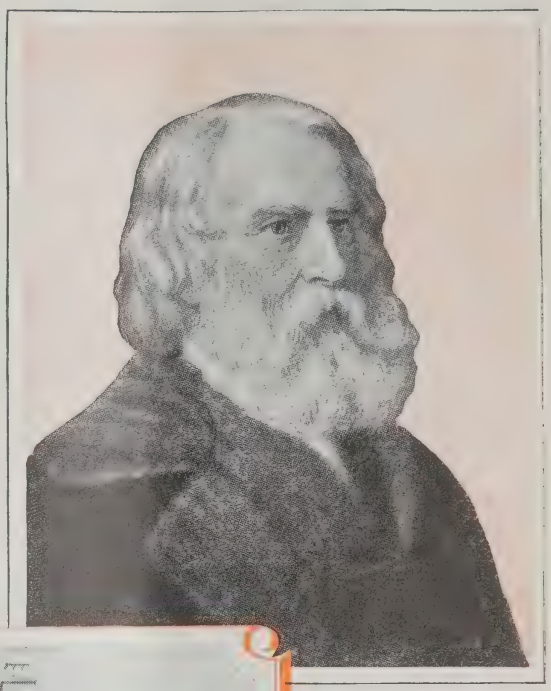
It was about eleven o'clock. The train was approaching Newark. Half a dozen correspondents were in their shirt sleeves, with coats and collars off, indulging in a spirited game. Others sat about the table watching the contest. All supposed they were bound for Princeton, still an hour away. As the brakes were applied for the stop at Newark, Governor Wilson and his bodyguard, old Captain "Bill" MacDonald, of Texas, appeared in the dining room, with overcoats on and carrying their suit cases.

*Changing the Cars for Princeton*

"Are you men going on to Princeton with me tonight?" asked Governor Wilson, with a smile in his eyes.

"Sure," they replied, looking up with surprise.

"Well, you'd better cash in and come along," he said. "We're leaving the private cars here."



All jumped to their feet and Governor Wilson stood at the vestibule between the dining room and the compartment car, laughing heartily at the frantic hustling of the men to close their game, get their collars and coats on, grab their belongings from their compartments and get off the train with the candidate.

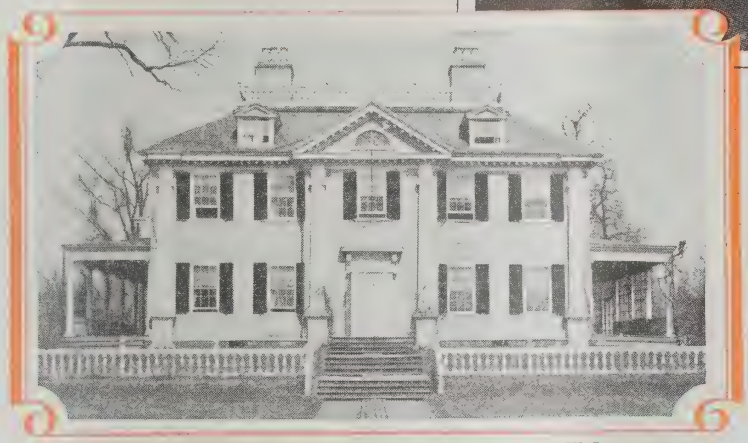
(To be continued in next week's issue.)

# What I Remember of Longfellow

## Famous Novelist's Son Gives Intimate Personal Recollections of the Author of *Evangeline*

By JULIAN HAWTHORNE

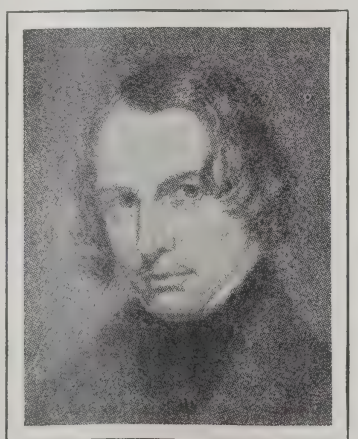
Portrait of Henry W. Longfellow, after a painting, 1876.



LONGFELLOW and my father were at Bowdoin College at the same time, but Longfellow matriculated the year before Hawthorne entered, and though they became friends in undergraduate days, still, between sophomore and freshman a gulf is fixed, not readily to be bridged at first.

But Bowdoin, though big enough to graduate some of the biggest men of the century in New England, was incredibly small, by physical measurement, compared with the stupendous aggregations of young knowledge-seekers in the universities of today. The entire population of Bowdoin in 1825 would make but a fraction of a single class in a Harvard or a Yale of a hundred years later. This sounds imposing. But on the other hand, the youths of this epoch forfeit inevitably the vast advantage of direct contact with their instructors, and still more with one another, that they had then. An undergraduate body numbering four or five thousand must be handled in platoons rather than as individuals; whereas a group of a hundred all told cannot avoid intimate personal relations with professors and tutors and with one another. And this advantage can hardly be exaggerated.

The influence of a good and wise teacher upon the mind and character of his pupil is lifelong: it purifies ideals and kindles worthy ambitions; and it supplies an education broader and deeper and more useful for the whole of life than is the training in specialties which is now in vogue. Of the myriads who emerge from our universities every year, barely a handful possess culture—that is, are sound all-round men, equipped for all emergencies, with an outlook at least over all fields of knowledge and of conduct.



The modern way is of course inevitable; the turn taken by civilization demands specialists. Time spent on Latin and Greek seems time wasted, because no money-making result is obvious from it. The question confronting the graduate is not, What are you?—but, What can you do? Science promises us longer life; but it will never be long enough for leisure, which, rightly used, is the only thing worth living for, because only in leisure can the sediment of existence settle and its true values become clear.

The instructors of a former age were as different as are their pupils from what they now are: they were older men, and their conception of success was less concrete and more spiritual.

Craigie House, Cambridge, Massachusetts, residence of Henry W. Longfellow.

The multitude of professors of today are almost as much children as are those whom they teach. It is their business to equip their acolytes not with wisdom but with practical knowledge. We pay perfunctory homage to our Emersons, Hawthornes and Longfellows, but we can't afford to make any more of them. Once was enough: there is no longer place or need for them. And our esteem for such giants as Darwin, Huxley and Edison ignores the mighty and original imagination which rendered possible their achievements.

Portrait of Mr. Longfellow (etched from a painting), 1840.

Not less valuable than this intimacy between student and teacher was the young men's intimacy with one another. Each member of a class of twenty or thirty may have personal intercourse, during his college career, with all the other undergraduates of his time. Today a man may pass through his years with no more than a nodding acquaintance with any but his fellows in one or two "societies," which, moreover, exist less for true social purposes than for certain special objects.

Thus it happens that in a university of four or five thousand members, no one of them may find opportunity to form as many fruitful friendships as little Bowdoin afforded a century since. Hawthorne, not of a gregarious disposition, became allied with such diverse men as Franklin Pierce, Horace Bridge, Jonathan Cilley, and Henry Longfellow. Of these, Longfellow alone possessed independent means—very modest, no doubt, by our present estimates, but enough, in the New England of the fore part of last century, to enable him to choose a career without consideration for its pecuniary rewards. He was studious by choice, and a poet born. Hawthorne, though a reader of many books, most of them good ones, was rather averse to assiduous study, and showed as yet no decided bent toward the literary profession. He was perhaps closer to Pierce, whose ambitions were political, and to Bridge, who was to enter the Navy, than he was to Longfellow at that time; but there was an enduring friendship between him and the latter; he liked Longfellow's poetry, and Longfellow was always a cordial admirer of Hawthorne's stories, and was one of the first to discern and to declare the signal merits of *The Scarlet Letter*.

Their relations became more intimate as time went on, and I shall presently quote

the lovely tribute which the poet paid to the romancer after the latter's death. He survived him by more than a score of years, though his constitution had seemed delicate in his youth, whereas Hawthorne was remarkably strong and vigorous. Longfellow was younger by three years than my father, and he entered Bowdoin at the age of fifteen and took a good degree. Scholar and poet he remained all his life, though for a few years he was professor of modern languages at Bowdoin, and later at Harvard. He made his home in Cambridge, in the beautiful old mansion facing Charles River and already distinguished as Washington's headquarters in an early stage of the War of the Revolution. Miss Alice Longfellow occupies it now, I believe. The venerable house is itself a poem. But it is better lived in by some harmonious person than to be stiffened into a sort of museum, like Alcott's "Apple-Slump" in Concord. A house is for human life, and when that has passed from it, let it pass also.

Longfellow, after Bowdoin, journeyed to Europe to complete his education—as would have been said then. He was a student of modern languages and German literature impressed him at that time, not to his benefit on the whole; Carlyle was setting our taste for it, but it was Carlyle who profited most: his essays and translations were incomparable. For Emerson the Germans supplied transcendentalism, and for Longfellow some weak prose and several renderings of sentimental German rhymes. He was to revisit the Old World when he was older, and it was the Italians that he studied then, and perhaps conceived the enterprise of translating Dante's *Divina Commedia*, one of his last great works; there is no better or more faithful interpretation. To be sure, Dante's epic and his *Vita Nuova* are, according to our young Mr. Mencken, "piffle"; but we did not at that time possess our present clarity of vision.

Longfellow published a volume of his own poetry in his thirty-second year, and another three years later. They set his tune and made his mark. He was afterward drawn into the anti-slavery imbroglio, and did indignant verses about the negro; but such things are for the hour, not for posterity. A portrait of him, a lithograph, was frontispiece of *Voices of the Night;* my father had a copy of it. It showed an amiable youth with a big forehead and slender lower face, beardless and amiable, emotional and romantic, ardent with ideals; the whole supported on a tall pedestal of stock and collar, in the fashion of the day. Men's clothes did not fit them well in the mid-century and were redeemed only by the flowing military cloak, introduced by Wellington in the Waterloo era. But though clothes were ill designed, the material was admirable; the broadcloth was still good after fifty years' wear.

Longfellow's chin had not the aggressive character which is preferred in our contemporary fiction and collar-advertisements, nor had his lips the immitigable set of today; the face was saved from weakness by the noble brow and large, clear, hazel eyes. But it was not until he let his full beard grow that he was recognized as one of the handsomest men of the time: he was a delight to behold. He was of full middle height and well proportioned; and he early found a tailor who improved every advantage which this foundation for art supplied. Longfellow, in my memory, that is, during the last thirty years of his life, was always perfectly clad, and even in his old age he held to the ideal. One usually saw him in a snug-fitting sack coat of dark cloth and lighter-hued trousers: a collar and scarf, with a jeweled scarfpin, the envy of every Harvard undergraduate: shoes spotless and lustrous, gloves, and a silk hat.

The whole figure was as trig and trained as a West Pointer's; and the head was superb. The beard was not long and stringy, but all curls and vitality, and the hair of his head was abundant and hyacinthine. There is a bust of the Greek Sophocles for which he might have posed; or, except for the awfulness, he resembled the Phidian Jove.

But his expression was of glowing, sympathetic amenity, radiating happiness and good will to man; his ready smile brightened the day. He looked like a good man, prosperous, the most popular and loved poet in New England: and he was precisely all that. He had outlived the physical frailty of his youth; he was married to a lovely woman whom he ardently loved; he had charming children. He dwelt in the pleasantest old house in Cambridge. Life was beneficent to him; he was honored by his peers.

But life was not to leave him unchiseled by grief. One of his children died. The loss cast a shadow over him, but it was transparent, and he found a beauty in it which was reflected in his poetry. But there was to be a later tragedy, too poignant for poetry, and the blow fell suddenly, with no forewarning.

Bust of Henry W. Longfellow, on grounds of the Longfellow home on Brattle street, Cambridge.

It was on an autumn or an early spring day 1867 or 1868, with sunshine, yet cool enough for a fire in the open grate. Longfellow and his wife were together in the tranquil living room, with the prospect before them of tranquil years of ripened marriage love; they had always been lovers. The woman, passing before the grate, was all at once in flames. Her skirt, of light white material, had been wafted into the fire by a quick movement, or by a draught of air from the open window. Her husband sprang to her and tried to brush out the fire with his hands, which were severely burned; but the flames leaped upward and could not be quenched. To her the injuries were fatal. The horror of the experience to a man of Longfellow's tender sensibilities seemed intolerable.

But aided, I suppose, by religious faith and by his temperament, the poet survived. If I am correct in the date of the calamity, he was at this time engaged upon his translation of Dante's poem, which was begun in 1867 and finished in 1870. The poem is a stern one, but its lofty imagination may have helped to comfort him. Interspersed between the cantos of the poem are sonnets which he wrote during his work, and among them is some of his finest verse. They make no direct allusion to his loss, but there is an organ note in some of them that is absent from his earlier product. For, be his absolute stature in poetry what you like, he was in his degree a true poet, whose life inevitably declared itself in verse. His intuition for the right words and rhythm was marvelous, and so effortless that the reader is affected, he knows not why: the simplicity and straightforwardness amount to genius.

He had published *Evangeline* in 1847, and though areas of it are dry, there are passages of touching beauty. My father read and re-read it, and gave it to me to read, so that I was familiar with it from my childhood. The story had been found by my father in the annals of British dealings with the northern settlements, and he had thought to make it the subject of a romance; but Longfellow, to whom he spoke of it, was so much impressed by it as a theme for a poem that Hawthorne gladly surrendered it to him, a pleasant incident in the relations of authors. And but for this, Hawthorne might have written a book about the Acadian lovers instead of the darker tragedy of Hester Prynne and Arthur Dimmesdale in *The Scarlet Letter*. Destiny was kind to both romancer and poet.

In 1853 we went to England, to remain there seven years. In 1855 appeared Longfellow's *Hiawatha*, the fruit of his studies of the Indian legends. The poem, in book form, appeared immediately in London and was for several months the staple stock-in-trade of British reviewers. The form and versification were so unusual that there was a prevailing tendency to ridicule the work; and Henry Bright, a dear English friend of my father, fell into the habit of putting his private letters into Hiawathan verse, entertaining both to the latter and to himself.

Hawthorne, however, was far from sharing the current English opinion of the poem; his insisted that it would outlast most English and American poetry of the day, and he read it from beginning to end to our family circle in the evenings at our little villa in Rock Park, across the river Mersey from his office in the Liverpool consulate. It had an immense success with Hawthorne's three children, who spoke in Hiawathan terms long afterward; and time has confirmed Hawthorne's judgment, and even the English skeptics have long since re-

pented. As I regard it now, it seems to me one of the most original and satisfactory achievements in verse of the century. Its force and fire are unabated from start to finish, and it is fresh and hearty as a spring morning.

For all the transient failure of Hiawatha in the Old Country, England in the mass had always been assiduous readers of Longfellow, and had international copyright then been established, he would have made an exotic as well as a native fortune. But he was never in need of money, and I doubt whether poverty would have been a stimulus to his best work. He touched common life and emotions with beauty, but might not have proved an interpreter of the deeper soul. After his wife's death there was much thoughtful and graceful quality in his work. He liked to versify stories, like *Miles Standish*, *Tales of a Wayside Inn*, and *New England Tragedies*; and he was always good at a ballad, such as *Paul Revere*, and the earlier *Skeleton in Armor*. He could put moralities into effective verse, and perhaps *Excelsior* may be his best-known inspiration. He was not so stern a critic of himself as some poets are; he innocently put forth not a few surprising banalities. But many people like banalities and will read nothing else. If a writer once gains a footing with these, his audience will remain large, in spite of whatever he may venture on a higher level. They will enshrine what they care for in their albums, and accept the rest on faith.

***He Put Forth Surprising Banalities***

The present age has probably never heard of *Proverbial Philosophy*, by Martin Tupper; certainly has never read it; and yet for a score of years millions of copies were devoured in England, and tens of thousands of our grandparents in this country swelled the chorus. Lincoln said that God must love common people, or else He wouldn't have made so many of them; and there wouldn't be so much commonplace verse unless it did good to the innumerable patrons of it.

But there was gentle dignity and eloquence in almost all of Longfellow's later writings. He had never knowingly insulted his muse, and she always stayed his friend. He entered into the life around him, was gifted with social charm, and enjoyed the New England society, and the closer he kept to Boston, and still more to Cambridge, the more was he contented, giving and receiving pleasure. After Hawthorne came back to Concord in 1860, Longfellow would occasionally adventure so far; but he had never cared for transcendentalism or its professors, and could not find congenial companionship in Emerson and Alcott. With Hawthorne, however, he was always at his best; but he would rather entertain him in Cambridge, or surprise him in some rare visit to the Old Corner Bookstore on Washington and School street, than invade his Wayside privacy. For men of such widely different type, their friendship and liking for each other were remarkable.

***The Last Scene Took Place in Sleepy Hollow***

In less than four years after the return from England, Hawthorne died; it was mid-May, and the season was rainy. But on the day of the funeral, at the burial-ground in Concord called Sleepy Hollow, the loveliest of spring sunshine rested on the land. It was the twenty-third of the month, and James T. Fields, the friend and publisher of all the New England authors, had arranged the details of the ceremony. Around the open grave, beside Hawthorne's widow and his children, stood Emerson, Alcott, Holmes, Lowell and Whittier; and when, after the burial, the carriage containing the family of the romancer passed through the gate of the burial-ground, those old friends were on each side of the way, and bared their heads in love and reverence to the woman who had given him happiness for more than twenty years. I remember she was perplexed at first, but then said, with a smile of recognition, "Oh, it's because I'm his wife!"

A few days afterward, she received a copy of the little poem, part of which is quoted below, in Longfellow's handwriting; he asked her judgment on it before giving it to Fields for *The Atlantic*. Except for one or two verbal alterations, the printed version does not differ from the poem:

"How beautiful it was—that one bright day
In the long week of rain;
Though all its brightness could not chase
away
The omnipresent pain.

For the one face we looked for, was not there;
The one low voice was mute:
Only an unseen presence filled the air,
And baffled our pursuit.

. . . . . .

Ah, who shall lift that wand of magic power,
And the lost clew regain?—
The unfinished window in Aladdin's Tower
Unfinished must remain."

***How Longfellow Looked in His Last Years***

The allusion is to Hawthorne's romance of immortality, three or four chapters of which had appeared in *The Atlantic* at the time of his death. The fragment has the quality of his finest work. Thackeray had just died in England, and Dickens was soon to go: and Longfellow, and the others. In 1853, when preparing to go to England, Hawthorne had burned all the letters which his wife had written him during their betrothal and afterward, and he had written in his journal, "The world contains nothing else like them; and now they are all dust and ashes.—What should we do without fire and death?" And Tennyson said,

"The old order changeth, giving place to new,
And God fulfils Himself in many ways,
Lest one good custom should corrupt the
world."

Though Hawthorne and Longfellow kept their distance from each other with a sort of mutual respect, the genius of the one allied to the other but not one with it; yet their lives were interwoven in human sympathy, and at signal moments they touched: a high form of mortal friendship.

The poet appeared somewhat broken during the last years of his life; enfeebled, but not, like Holmes, bewildered and unhappy. His hair and beard turned gray, but his face had a finer beauty than ever, and he was still careful of his personal habiliments. He lived in thought, seeing the friends and events of his past career in a soft-hued perspective, and naïvely confident of personal immortality beyond the grave.

Emerson, four years his elder, and faltering in his mind, was still in life when Longfellow died, and was taken to his funeral. The anecdote has been often told: When, in his turn with the other mourners, he passed by the open coffin in which the body lay, he said: "Our friend has a beautiful face; but I do not know his name." He was to follow him at no long interval to where all men of good life and purpose recognize one another.

## Packets Are Back on the Mississippi

THE packets have come back to the Mississippi. New Orleans and Natchez and Memphis and Cairo and other riverside towns are once more ports of call for a system of water-borne traffic comparable in size, and infinitely more valuable as to cargoes, with that of the romantic days of the *Robert E. Lee*, the *Natchez*, the *Eclipse*, the *Shotwell*, and a score of other palatial stern-wheelers that made river history. Uncle Sam has put these new packets on the trade routes of the old, carrying 10,000 tons of freight, where the stern-wheeler of the periods before and after the Civil War carried 200 to 500 tons. Instead of three and one-half to four days between New Orleans and St. Louis—the time of the fastest of the old packets—they require a week or so for the downstream voyage and twelve days or more for the upstream journey.

***Call at All Ports on the Father of Waters***

Where the steamboats used to make stops at every landing on the Mississippi, and on some of the streams feeding into that river, until they were driven out by the railroads, now the new steel, steam inland freighters are calling regularly at all ports on the Father of Waters, and smaller steamers and motor craft are carrying their cargoes up and down the side streams. The new packets are the largest, most powerful and most modern, as well as the costliest carriers of cargo ever installed on inland waterways. They consist of three types of towboats and two types of barges.

Two of the towboats are for towing exclusively; they are used on the Mississippi, while the third, used on the Warrior, combines a huge barge and a tug in one, with the further ability to tow five or six loaded steel barges behind it. This is used on the Warrior River and between New Orleans and Mobile. Upward of forty steel barges for use on the Mississippi River have been delivered and are in service. They are 230 feet long, 45 feet molded beam and 11 feet deep, with a cargo box 184 feet long, 37 feet wide and rising nine feet above the deck. The hull is divided into eight compartments in the hold, and the total cargo capacity is approximately 1,800 tons on an eight-foot draft.

To tow these barges, a number of the most powerful towboats ever used on inland waterways have been provided. They are propelled by steam engines, of the same type and size as those used in deep-sea going vessels built during the war at the Hog Island yard. They are all steel, 200 feet long, 40 feet beam and 10 feet deep, drawing six and one-half feet of water.

***A Relic That Will Not Pass Away***

The dwellers along the river and those who work on the mighty stream admire the new system of inland freighters, but they look with regret on the passing of the old river steamer. Some of them cling with the greatest tenacity to travel by boat, and there are hundreds of persons living along the shores of the Mississippi who always ride on the *America* and the few other remaining steamers, in preference to the "steam cyars."

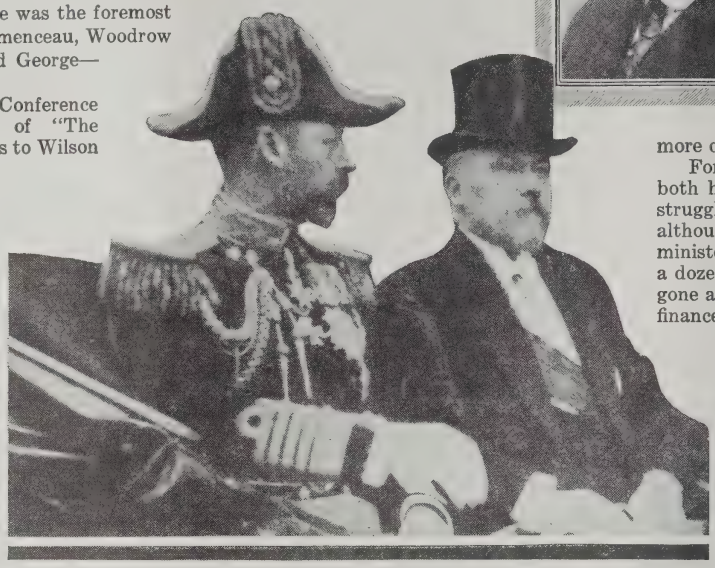
One of the relics of the old days is the Mississippi pilot, and he is in no danger of passing away.

# "Off Again! On Again! Gone Again!"

(Concluded from page 5)

he himself became a minister and eventually a Premier. He served twice in the highest office of the state, both terms of unusual length. His second, of course, was the more memorable, as he was in power during the closing year of the World War and as Premier of France was the foremost of the "Big Three"—Clemenceau, Woodrow Wilson and David Lloyd George—at the Peace Conference.

In fact the Peace Conference ruined the reputation of "The Tiger," for his concessions to Wilson and Lloyd George so disappointed the French people that in 1920 he withdrew from the contest for the presidency, because defeat seemed certain, and retired from the premiership a disappointed man.



Raymond Poincaré has been another outstanding figure in recent French history. He was Premier for a year and resigned when elected President of France in January, 1913, holding that office during the World War. It is maintained by some informed persons that he also broke the tradition of aloofness from participation in public affairs by his insistence upon a unified command and the appointment of Marshal Foch as generalissimo of the Allied Armies.

After the war he emulated Clemenceau by taking up political journalism as the most determined advocate of repressive measures toward the late foe. This stand was so popular that he soon returned to active political life, became Premier in 1922, directed the invasion of the Ruhr, obstructed the adoption of the Dawes Plan and by his extreme policies brought on the popular reaction that resulted in the elevation of Edouard Herriot, the most nearly radical of all recent French Premiers.

Right—Edouard Herriot.

Below — Raymond Poincare, photographed when he was President of France, with King George of England. One of the chief responsibilities of the presidency in France is the entertainment of visiting royalty.

This brief reaction, occurring at the same time Britain was experiencing a "swing toward the left," brought about the withdrawal of the French from their untenable position in the Ruhr and the reestablishment of a working concord with the English, with the ultimate restoration of Europe as the primary objective.

But the most remarkable of contemporary French statesmen is undoubtedly Aristide Briand, who, when he offered his resignation as Premier on March 6, was reported in the press as closing his eighth occupancy of that office. The report has only a literal accuracy. He has been Premier six times, though, on one occasion he resigned only to return to power immediately with a reconstructed cabinet, and on another he became Premier but gave up the task of forming a ministry, although he made a second attempt and succeeded less than a week later.

To have been Premier of France six times in a period of less than seventeen years is sufficient distinction for any Frenchman, but Briand has faced more crises, battled with more opposition and overcome more obstacles than any of his compatriots.

For many months, in fact throughout both his more recent terms, Briand's chief struggle has been with financial affairs, although he has, himself, acted as foreign minister. He has retained power while half a dozen ministers of finance have come and gone and he may yet serve a Premier while finance ministers continue to come and go.

In the meantime the Presidents of France remain inconspicuous figures, except at great state social affairs, as the entertainers of illustrious visitors and as a visitor to the rulers of other countries. Although elected for a term of seven years, few of them have served that time. Jules Grévy was reëlected but resigned before his second term expired. President Sadi Carnot was assassinated, President Casimir Perier resigned because of the insignificance and impotence of the office, President Faure died in office and President Alexandre Millerand, who resigned the premiership to accept the post, was forced to resign in 1924, when the majority in the Chamber refused to accept any Premier of his selection because he had been active on the other side in the previous campaign.

Only Presidents Falliers and Poincaré served full terms during the present century, and the latter as well as the former would now be practically forgotten had he not been a Premier during a trying time. Few Americans know who the present President is, and fewer still are certain that Gaston D-o-u-m-e-r-g-u-e is the correct spelling of his name.

# The Eye and Art of Seeing

A REMARKABLE lady lived in a charming white shingled cottage. The cottage was an architectural gem, a miniature Mount Vernon, so much did it resemble Washington's famous home on the Potomac. Six slim white columns supported the delicately designed porch cornice, and three large French doors opened from the living room on to the brick-paved porch standing but a step from the ground. With its green shutters and cool, gracious porch, with its background of beautiful shrubs and flowers, this modest whitewashed cottage gave to the discerning eye the same pleasure and enjoyment that music gives to the ear.

This lady at times played on her piano some of the great old tunes, and the people would gather near to listen.

After a time the villagers began to come under the spell of the architectural beauty and charm of the musician's little cottage. Many would go out of their way to catch a glimpse of it, hardly realizing that their eye had now become accustomed to and enjoyed seeing the musician's little home quite as much as their ear enjoyed the music.

Now, one reason why most folks enjoy music more readily and naturally than they do architecture or art is because little, if any, conscious effort is required to hear, whereas considerable conscious effort is required to see.

The habit of "conscious seeing" has not been developed. If we use our faculty of observation and begin to "see" consciously just a few of the many things in the realm of art that are presented to our gaze, we will soon begin to receive messages of beauty through the eye that will give us as much pleasure and enjoyment as the messages of music received through the ear. Our vision, properly developed, might easily become a sixth sense.

It would be impossible to appreciate any one melody if compelled to listen to a dozen or more unrelated melodies at the same time; and the same difficulty is encountered in the way of training the eye. Museums compel us to view rooms crowded with pictures, all trying to attract our attention at the same time. Buildings and houses all crowded together in blocks present a similar distracting scene; our eye only registers confusion. Select some of the really fine buildings we read about or see illustrated—a library, a beautiful church, some fine public building or residence—and concentrate on these until we begin to recognize their characteristic features of harmony, interest and beauty. After a while we will more readily appreciate the good features in other buildings.

# Chats with Office Callers

"I had something of a spree this week," said ***The Man from the Other Room,*** "I read the Mencken magazine number which Boston tried to suppress, and I saw *What Price Glory*. I understand that the author of the magazine article is a descendant of a famous Methodist bishop. He certainly shows it. There are some things which generations put into a man's blood, of which he will never get rid. I mean good things. The bad works out; the good works in. Generations don't go to pieces. This young fellow is a temporary victim of the New York East Side slant on life which is interesting but unimportant. The objection to his article is not based on the question of truth and brains, but of a higher element composed of both, which is *taste*. He has a right to chalk pictures on the alley fence if he wants to. The difference between our day and other times is that now the printing press makes the alley product permanent. I hope this young scion of a civilized family will keep all his present effusions to read when he is sixty years old.

"All the same, being Methodistically generated, as I said, the young fellow cannot escape truth. I think that Mr. Mencken should print that article and send it to all the small town ministers of the country. Everyone knows what chance a certain class of unfortunate has in any church. And if old Bishop Asbury has been reincarnated in one of his descendants, the case might have been attacked inside the church instead of from the safe irresponsibility of the Philistine lines.

"It was, however, a fortunate occurrence for Mr. Mencken's magazine. At least a million dollars of the best—because unpurchasable—advertising."

"And what will your state do when the use of tobacco is prohibited?" I asked a ***Former Cabinet Officer*** who was offering us his gracious hospitality. "The same thing you will do when they prohibit the publication of magazines," he replied; which I thought was a very good rejoinder, even if it was not exactly an answer. But the answer came along presently. "I am not a smoker," said he. "I have never used tobacco in any form, nor do I suppose that I ever shall. And I am a convinced believer in the justice of any kind of prohibitory laws whenever they may be necessary. Though I often ask myself, Who shall decide when it is necessary? It is the same feeling I have about censorship—Who is to censor the censor? I have seen so many mistakes made in censorship—mistakes much greater than the evils it was designed to prevent—that I sometimes wonder if it isn't better to let some things 'ride' than to risk the misapplication of the machinery which would be needed to combat them.

"As to tobacco, it is not in the same class with liquor. I suppose its abuse has harmful effects on the individual. But I have never heard of tobacco making a man beat his wife or murder his friend or turn highwayman. I have never heard of tobacco driving a man wild and goading him on to assault. In our state institutions we have many who have been brought there through liquor—mental cases and criminals; but we have not one who was brought there through tobacco. Until the bill of particulars against tobacco is much worse than it is, until it becomes a flagrant social menace, it is in about as much danger of being prohibited as is English breakfast tea."

***They Were Playing the Great and Goodly Game of Golf*** amid the spring glories of North Carolina's most famous resort. Mocking birds chattered in the trees at the side of the course. Dogwood spotted the groves with sprays of white. The holly trees shone green and the hibiscus flamed. Fragrant breezes swept across the links and bore along the odor of fresh grass. Nowhere is spring more lovely than in the Middle South, where the softness of our perpetual summer-land is mingled with the harder qualities of our northern climate. Over hills and streams, through fairway and roughway, the game proceeded, while diminutive black caddies trudged behind, stolid, silent (un-negro-like circumstances attributable, doubtless, to the discipline of the caddie-master)—stolid, silent, I say, until thawed a little by cautious and sympathetic approaches.

"Yes, sah, dey done go no'th but most of 'em done come back agin. Dey come back in the fall, most o'um. Dey don't like wintah up no'th. Den dey have to pay all dey get to live. Yes, sah. Dey come back and dey say it's tough—putty tough. Dey say it's all right for dem dat is ha'd-boiled. I guess my uncle is ha'd-boiled; he staid two yeahs. He's up in a town called Massachusetts. He found a good man in dat town, he says. Do day stay heah when dey come back? No, sah, dey don't aim to. Dey say dey goin' to give de No'th anothah hard wrastle in de spring. Den when spring comes, dey is down South—away down South—fa'thah than here; yes, sah. Dey mostly don't go back No'th no mo'. Dey keeps a-goin' South. Big truck comes heah from all places down South and takes dem away. Good jobs. Oh, yes, sah, de big truck jes comes into town and de man says all dat want jobs, jest go back wif him. And dey go. Wheah? Mostly Flo'da; yes, sah. Mostly Flo'da. No, sah, Ah cain't go yit. Mam says Ah'm too leetle yit. We'se good caddies and cooks around heah. Yoah iron? Yes, sah."

***A Southern Lawyer*** stood in the lobby of the Sir Walter Hotel at Raleigh, North Carolina, and said a good word for the *Congressional Record:* "I find information in it that I cannot find anywhere else. You may be sure it repays me to study it daily; otherwise in my busy life I could not afford the time. I read every word of the debate over the impeachment of Judge English. As a lawyer it vastly rewarded me for my time and effort. Do you know that there is not a textbook on impeachments in all the law literature of our country? But that Congressional debate, as printed in the *Record*, gathered up all available material on the subject from the time impeachments began, gave the name and character of every impeachment proceeding ever held. I think that today the *Congressional Record* constitutes our best textbook on that subject. And that is only one. There is a host of other subjects. So many, in fact, that I wish more people took the *Congressional Record* as a daily newspaper, and read it."

"Washington is much less wet than it was," said a ***Resident of That City*** as we rode along on a train. "I could almost put it in positive form and say that it is *drier* than it was. I think it is not due to any causes other than those that are at work everywhere. Our worst trouble in Washington, of course, is the political bunch, who are away from home and who have mistaken ideas of what Washington life means. The liquor business never did have a great deal of support from people who *live* in Washington.

"The facts are these: Hundreds of small bootleggers have quit because business has fallen off. Anyone can tell you that. And why has business fallen off? Well, first of all, the drinking men got very sick and tired of the stuff that was sold to them as liquor. It had no stimulating or exhilarating effect. It wasn't the old-time whisky. Every patron of the bootlegger will tell you that even the best brands put up for American consumption have no 'rosiness' in them. They have only depression. There are no 'happy drunks' with bootleg stuff; they are all morose or doped drunks. Well, men get tired of that after a while, and they stop buying it. The fact that they have stopped is shown by the decreased number of men who sell it. Their business has had a big falling off. I have just been going over in my mind the personnel of three or four groups I go around with. Almost without exception those men bought and shared liquor until within the past year or year-and-a-half. I don't know of one that does so now. Our parties are all dry, and no one seems to think it strange.

"I suppose that there are other and higher reasons than their weariness of the quality of stuff they were getting, although they don't say much on that score. But I explain it this way: they ran their 'personal liberty' race, and, that finished, they are ready to settle down. They protested and proved their independence of the prohibitionists, and, having done so, they are now ready to recognize, in fact they *have* recognized, the regularity of the prohibition law. They feel very definitely that if we are to have a government, we must stand by its laws.

"I have talked with other men from various parts of the country, and they tell me that in their own circles, the same change has taken place."

Gene Stratton Porter's "Limberlost Cabin," at Rome City, Indiana.

# Gene Stratton Porter—the Woman

(*Continued from page 2*)

books. But if the girl is sick—she's the one, not you!"

Mrs. Porter had the interest of the girls of America at heart. It took her no time to say to me, when I invited her to speak to the girls of Indiana at the First Congregational Church of Indianapolis: "I should surely accept your invitation to speak to the young people of your church what I always say in all the books I write, that I stand for truth, morality, love and home." These motifs exist in all of Gene Stratton Porter's books.

With so serious an aim, it is no wonder now and then a dilettante critic, unable in the muck-wash of pseudo-realism to understand her, pains her by misunderstanding and misinterpretation.

Mrs. Porter's misfortunes began, she told me, by her having jumped off an eight-foot pile of rails and breaking a bone in her foot. At this time came a painful criticism from *The* ———— where a Mr. ———— accused her of nature faking and incidentally, in one example, making a certain gray moth "blush." "I had never spoken of such a moth as anything but gray," she said, "and no such lines as the critic put in quotation marks existed in any of my books.

"I wrote to him about this, but received no satisfaction, to correct the wrong impression he had given many thousands of readers. This pained me more than the broken bone in my foot," she confided.

A gap occurred in our all too infrequent correspondence that winter. "Attacks of grippe and acute tonsillitis affecting my eyes," she wrote, "sent me to the hospital for the removal of my tonsils."

As her greatest work had been going on since this time, none of these troubles indicated physical failure. Lest the public so construe it, she had kept from them what she had told me and her publishers—except the broken ankle. I have been glad I did not publish an article about our visit before and I tell this after a silence of several years for two reasons: First, because Mrs. Porter long ago proved the incidents were but temporary ailments and had returned to her wonderful youthful health. Second, because of the proof of her refusing to yield to discouragements. Many women would have gone into a nervous decline. Instead, Mrs. Porter took on harder work than ever.

"About your article," wrote her amanuensis, Mary E. Grimes, "she sat up long enough to run through your story with a pen, making a few changes. She corrected a few small misapprehensions concerning her cabin, it being on a lake shore, and all logs, and one daughter being her family."

"Have you seen my *Birds of the Bible?*" she asked me in one part of her conversation. Then she went on to say, "I took more interest in it than in most of my books."

"Did you go to Palestine to study *birds?*" I asked.

"Not necessarily," she replied, "for so much tree life and water has gone that the same birds are gone, too. Even the names of the birds are different. But I trace them by similar birds I identify here, and so from *Genesis* to *Revelation* I made my bird study, taking up, one at a time, each bird mentioned."

Scientifically, this analysis has been chosen for one of the most accurate scientific encyclopedias today on bird life in the Bible. Such a book is an example of her constructive originality.

Another example of her originality was the discovery of a mountain painter, Charles Failles, Jr., of Indianapolis. He was a discovery of mine—especially his delightful stories of the wild life around him while painting on the lonesome peaks. Failles had a soul so imbued with the spirit of the mountains that he disappeared for months and lived alone. He was "still hunting" in the Rockies, and came back with heroic perspectives of the many-hued peaks.

Hoping to make him better known, I persuaded him to give a lecture and exhibit three of his paintings.

Entirely apart from this, Mrs. Porter found him.

One day, she was searching the art galleries of our city for a masterpiece of nature painting. In Lieber's art studio in Indianapolis she started to go out when she saw the Charles Failles' *Perspective of Long's Peak* in the pink of sunset. My friend was planning to send it East, not intending to sell it.

"That!—That beautiful painting!—That is the one! Where did it come from?"

The proprietor of the studio summoned Charles Failles, and she argued three hours with him to part with the picture . Mrs. Porter won her case, and the exquisite canvas was transferred to her cabin. I had said in this article "to her hands." Sitting up in bed the first time to correct this article, she made the point more direct and accurate as to the transfer "to her cabin." She bought its "companion" for a present for her daughter's "new Ft. Wayne home." This sentence she also corrected to its present form. Hardly anything could be choice enough for the nature lover's gift. Therefore her original selection of Failles' mountain was a mark of her originality as a discoverer of human genius the public had not yet recognized. She could discover a man as well as a moth, a painter as well as a plant.

All of this revealed in Mrs. Porter an insight and sympathy that made me become bold enough to hazard a confidence myself about "moths." Unfortunately, in my utter ignorance, I referred to "moths" as "butterflies"! She interjected, "*You should not confuse moths and butterflies, as they are as different as ducks and chickens, the moths only living a few days, having no eyes, taking no food, their sole function in life to reproduce themselves. Butterflies see, feed and live a summer season. My work has been with moths alone.*"

There was encouragement in the novelist's eye, however. Unlike most geniuses, she had the drawing-out power of a good listener. She drew me out, and I told my story thus:

"I have officiated at a

Entrance to the grounds of "Limberlost Cabin."

good many weddings—but never one like this—a marriage of fairy-like, gorgeously winged moths. It was a marriage made in heaven. But it took place on the kitchen wall. The kitchen was on the northwest corner in my old parsonage at 26 Burncoat street, Worcester, Massachusetts. It had a screen door into an open lawn of green-sward beyond. Here one May day, my wife and I found a moth incrusted in its cocoon upon a twig. Breaking off the twig we carried it into the room. It hung upon the kitchen wall a number of days. One afternoon life began to evolve even as we looked. Unfolding the gorgeous planes of its wings, a glorious moth emerged!

"For a moment or two it stood, just born, but full-size, enfolded in its veil of golden spangles and lace like a bride more than a babe.

"Suddenly through the nearest crack in the door, which one could hardly realize was open at all, from around the corner outside, where the emerged moth could not have been visible, flew from the far-off sky straight to her side a male moth, six inches from wing to wing, silky and spangled with gold—identical in kind, and of a regal species never seen there before.

"After mating at the leafy altar, the bride, new born, left scores of eggs now fertilized and the next moment flitted away with her mate, just come, as if she had been with him always."

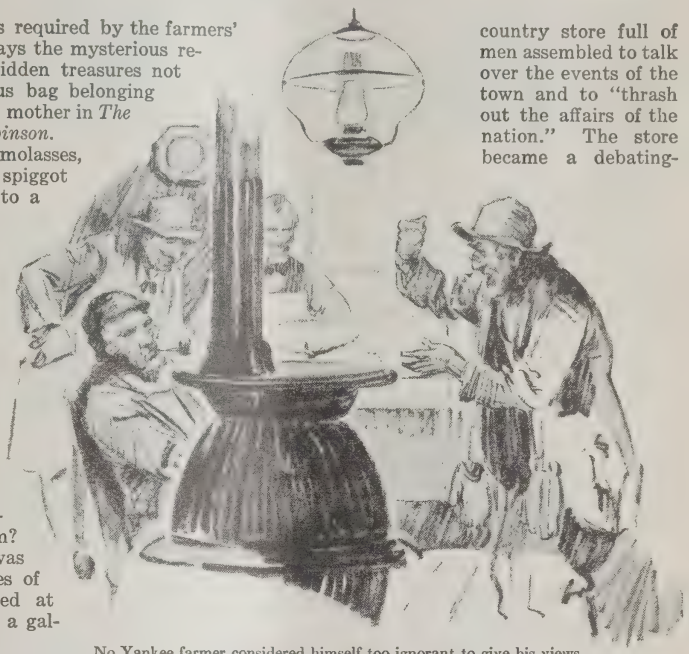
Brooding over this I saw Mrs. Porter's gray, seeing eyes flash insight. Her English color betrayed the priestess of the out-of-doors and its nature miracles. Then she had "open vision," and she poured forth a confirming epiphany that was almost a rhapsody: *"You saw it all! Your eyes were open! I have seen it a hundred times!"*

## Side Lights on the Bedouins

ONE traveler in the land of the Bedouins tells one story and another an entirely different one. Both stories may be to a certain extent true. The Bedouin exhibits one sort of conduct one day and another sort the next.

The Bedouins are interested in what the foreigner does in Arabia only in a moral sense, as long as no effort is made to interfere with their life and habits. If the foreigner wants to cluster around the city of Mosul and become highly excited over oil wells, build a large number of queer-looking derricks and keep crowds of men scurrying about like a lot of excited ants over a stream of smelly black fluid that comes out of the ground, well and good. The Bedouin looks on with interest and perhaps with suspicion for a time. He is ready to check any move that seems directed at his desert and grazing lands.

The danger lies in the Wahabis. These are brothers of the Bedouins in whom the religious strain has become fanatical. They are said to consider death a welcome thing, in that it opens the door to paradise. Their home is in the desert land of Nejd, which few men not of the Mohammedan faith have seen.



They might be called "fierce Puritans." They follow the "true teachings" of Mohammed, and are strict prohibitionists, forbid the use of tobacco, look with stern disapproval upon decorations in the mosques or upon the graves of the dead. They wear no jewels. Yet, despite their strict code of living, they believe that every Mohammedan has the right to live according to his own interpretation of the Koran.

# Passing of Yankee Country Store

(*Concluded from page 8*)

bring out articles required by the farmers' wives. And always the mysterious recesses gave up hidden treasures not unlike the famous bag belonging to the resourceful mother in *The Swiss Family Robinson.*

The odor of molasses, drizzling from a spiggot in a hogshead into a tin measure, the scent of coffee, the salty tang of dried fish, the sourness of pickled brine, the strong smell of Medford rum, intermingled into a more or less desirable perfume characteristic of the country store. Rum? Certainly. It was one of the staples of trade and retailed at twenty-five cents a gallon!

No Yankee farmer considered himself too ignorant to give his views.

Much of the trading was done by barter. Customers brought eggs, dried apples, salt pork, lard and hand-knitted stockings to exchange for "store things." Rags, too, were exchanged. All New England stores of the period had bins in their attics to hold the bags and bales of colored and white rags destined for the paper mills. What treasure-troves these rag bins were to the storekeeper's little daughter and her friends, until an anxious mother, fearing the spread of the prevalent diphtheria and scarlet fever, forbade the children to make doll clothes from the gay pieces!

Here it was that the New England tin-peddler was of assistance to the storekeeper and more than offset any inconvenience that he might cause by selling his wares to the farm women. The storekeeper unloaded many of the rags upon him and took in payment shining tins from the bright cart.

The story of the tin-peddler is closely interwoven with the commercial life of old New England. The first Yankee peddlers, William and Edward Patterson, came from Ireland to Connecticut in 1740. These enterprising brothers made tinware and carried their products to their customers in saddlebags. Later, when turnpikes were built and when a regular profession was built up by the shrewd Connecticut Yankees, the tin-peddler graduated from horseback to a cart, which was designed to carry the most wares in the least space, and was a maze of secret compartments, hooks and drawers. He was a boon to the isolated farm woman and to the storekeeper of remote country districts, and through him were distributed tinware, buttons, clocks, Sandwich-glass hand lamps and other sundries. His doom was sealed with the coming of the railroads, and only the swarthy pack-peddler of foreign birth was left to remind one in any way of the picturesque figure who once bartered and traded on New England hillsides.

Winter nights in the sixties found the country store full of men assembled to talk over the events of the town and to "thrash out the affairs of the nation." The store became a debating-hall, and as the loafers whittled and listened, the farmers and men of the village exchanged prices of stock and produce, discussed "the elder's" sermon and related school news gleaned from their children. They touched upon important details of sickness and stored up bits of gossip to carry home to their wives. National affairs interested them, and no Yankee farmer considered himself too ignorant to give his views on almost any subject. The customs at these unconventional lyceums became so widespread that they built up a characteristic institution of New England country life.

Just before town meeting life at the store began to take on new interests. Usually the store closed at nine o'clock, but during this exciting period it was often known to stay open until ten. There were excited discussions of taxes, of future town officers. The store became an unofficial caucus where plans were laid and factions organized. Occasionally there were arguments and talks that led to bitter feeling, but after town meeting things usually regained their normal level. These nights before town meeting stood for something vital in the history of New England, for individuality of personal expression and for promotion of community betterment.

The following years, after the storekeeper's son had inherited his business, found the village growing. Small lumber mills were bringing workers from outlying districts. Summer boarders were migrating in increasing numbers from the cities. The country store grew to meet the demands.

Then appeared two factors which have sounded the knell of the general store as it was known twenty-five years ago—the automobile and the mail-order house. There still remain stores, one is willing to admit, where everything is handled, from "knitting needles to plow points," but the crossroads store as it was is soon to be a thing of the past.

# Nations Take Action for World Sanitation

IN PARIS, after the war, when an attempt was being made to write into a treaty a world agreement for the future, someone inserted into Article 23 of the controversial document there drafted a statement that: "Members of the League will endeavor to take steps in matters of international concern for the prevention and control of disease."

A health section was created at League headquarters in Geneva, with its secretariat and technical staff.

The League of Nations established a second agency—a technical advisory committee. Through these bodies, fifty-two nations take action, authorize campaigns, instruct their permanent staffs as to what to do. Their action is virtually the action of the world.

Here are some of the concrete things this health section of the League has done. It established three training schools for health officers in the east—one in Moscow, one in Kharkov, Russia, and one in Warsaw. There are some seventy picked men in each of these schools taking three-month courses in sanitation and public health methods. Lecturers are sent them by the League. They obtain the best in the world. This is in an attempt to supply a need for sanitary officers in that part of the world.

There are very important regional problems. The eastern Mediterranean, for instance, is given to certain epidemic diseases. These are scattered by pilgrims who visit shrines of their religions in those regions. It is important to the nations of that part of the world and, for that matter, of all the world, that every precaution should be taken to control and eradicate those diseases.

In the Far East there are peculiar diseases. There are at places regulations that do not afford the necessary protection. There are at other points quarantine regulations that materially interfere with shipping.

Africa will furnish the problem for another regional study and convention. What sanitary control existed in Africa before the war has largely disappeared. Germany had extensive colonies there and her establishment was destroyed. These colonies have now come under mandate and the conditions that exist in them are therefore an international responsibility. Sleepy sickness, an entirely different thing from the sleeping sickness of civilization, is causing a great deal of trouble. It is to be studied and an international attack is to be made.

In medicine there is great need of establishing common standards in such matters as the strength of medicines. Canada, for example, discovered insulin, a remedy for diabetes. It is a matter in which the hygienic laboratories of the world are greatly interested. They will be talking about it, experimenting with it. It is one of those serums that is measured by its reaction on some living creature, man or experimental lower animal.

But it is probably true that the biggest advantage in the whole program will come through the fact that the whole world will become a reporting agency for the health section of the League of Nations. There has never before been any central world agency to which any outbreak and any disease would be reported and which would be in a position to act on its information for the interest of the whole world.

# A Dance A Week

## STEPS OF THE MINUET

The steps are somewhat complicated and require a great deal of practice. It will be found desirable to obtain instructions from a dancing master or other person thoroughly familiar with the movements.

*Pas Grave; slow, grave step*—Stand in 5th position, right foot in front; bend both knees, count 1; rise on both toes, count 2; drop weight on left heel count 3; repeat, stepping forward with right foot, and bring the left foot in 5th position, front. Bend both knees slightly, rise on both toes, and drop weight upon right heel. Count 4-5-6.

*Pas Marche*—March step. A simple smooth walking step, a step to each beat in the measure. In walking, the front part of the foot should touch the floor first, and the heel last.

*Pas Balance*—Balance step. This step may be used as a balance forward or backward, and is sometimes used as a progressive movement.

To balance forward, step forward upon right foot, count 1, and extend toe of left foot to left side, weight still on right foot. Count 2-3.

To balance backward, step back on left foot, and extend toe of right foot to right side.

If used as a progressive movement, step forward on right foot, count 1, slide toe of left foot to left side, count 2, draw left foot to right, count 3 (weight is on right foot during all three counts). Step forward on left foot, count 4, toe of right foot to side, count 5, draw right to left, count 6. (The weight is on left foot during the last three counts.)

*Pas Minuet step*—Start from 5th position, right foot in front.

Bend both knees, rise, and glide the toes of the right foot to the right side, count 1;

Transfer weight to right foot;

Extend left foot to left side, heel raised, count 2;

Bend right knee, draw left foot, with slightly bent left knee, to back of right, count 3;

Rise to full height on both toes, stretching both limbs, transfer weight to left foot, count 4; (right foot is in 5th position);

Glide right foot to right side, count 5;

Draw left foot back of right, left knee bended, count 6;

To move to left side, start with left foot in 5th position front.

*Pas Boure*—Place right foot back of left (both knees slightly bent) then step to left side with left foot. Repeat with right foot back as long as desired. If moving to the right, place left foot back of right.

*Pirouette*—Turning step. Step to right side with right foot, bring left foot in front and around to the rear of the right foot; in this position turn on both toes.

*Assemble*—Bring the feet together, either in first or fifth position.

*Pas Sissone*—Slide the toe of the right foot back of left foot, bend both knees, count 1;

Slide ball of the left foot to the left side, count 2;

Slide right foot forward in 5th position, count 3;

Continue as long as desired. To move to the right, reverse the movements.

### MINUET

The following form of the minuet is a simple arrangement in quadrille formation, which at the present time seems to be the favorite style. The steps may be elaborate or simplified to conform with the talent available.

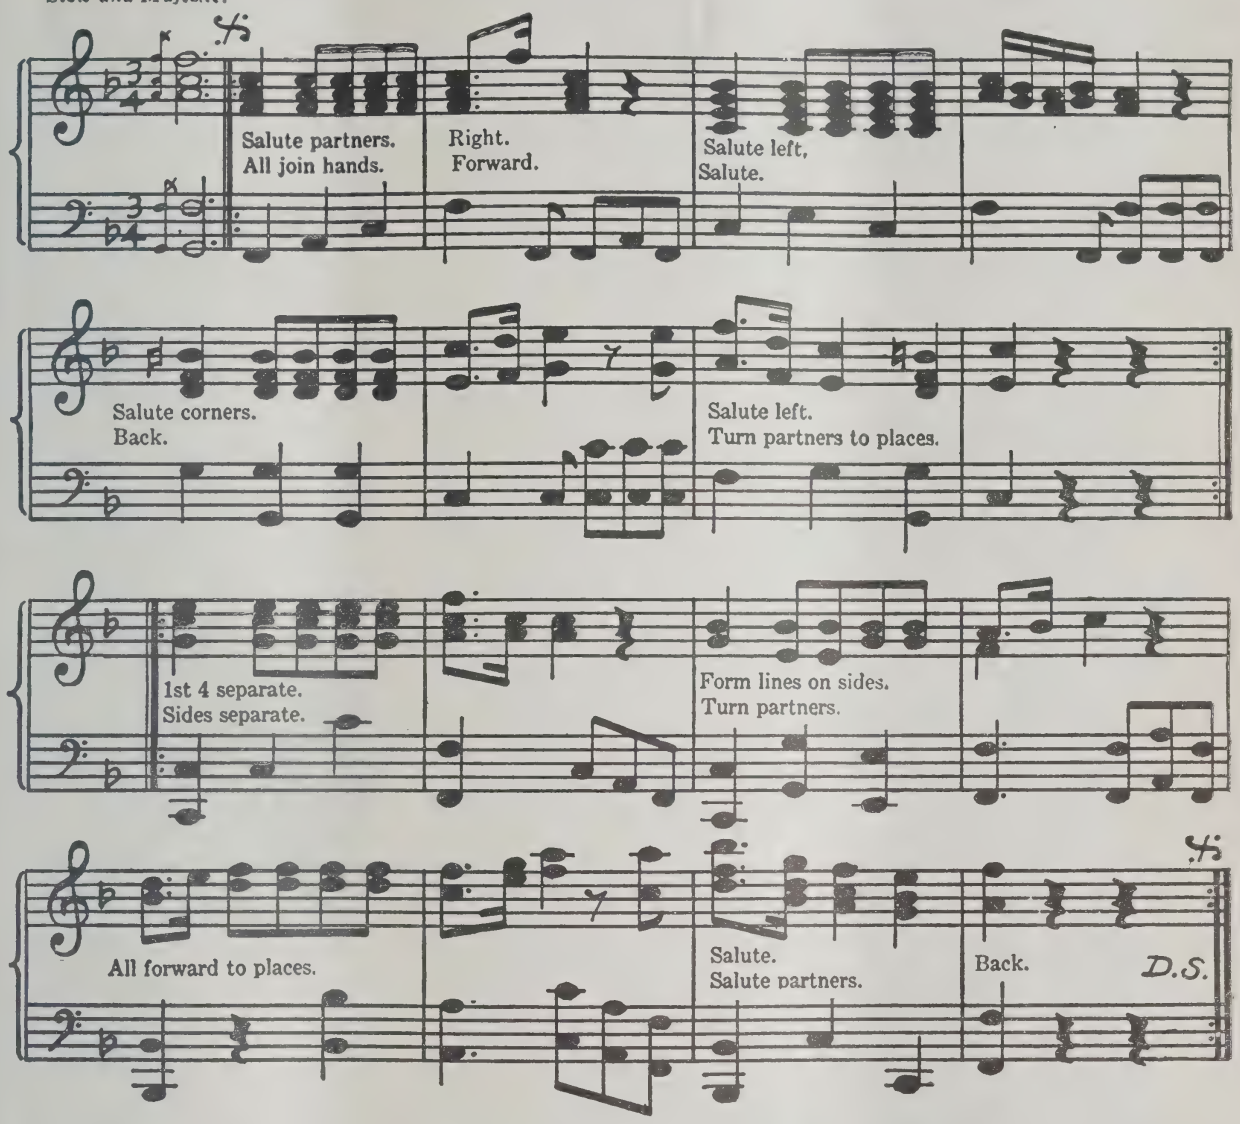
Salute partner right, salute partner left..... 4 bars
Salute corners right, salute corners left..... 4 bars
All join hands forward, salute..... 4 bars

Start with right foot to take two Pas Balance forward.

Turn partners to place..... 4 bars

Turn partners with the left hand.

First four separate, and form lines on the sides..... 4 bars



The head couples divide, Pas Balance forward, and join hands with the side couples. There are two lines, four dancers in each line.

All forward, return to place and salute..... 4 bars

(*Concluded on page 29*)

# MINUET

## The Court Dance of the Olden Time

Both lines move forward, the head lady and gentleman are directly opposite each other. Partners join nearest hands, and Pas Marche to original place. Side couples also return to place.

Sides separate, turn partners..... 4 bars
All forward to places, salute partners..... 4 bars

FIGURE TWO

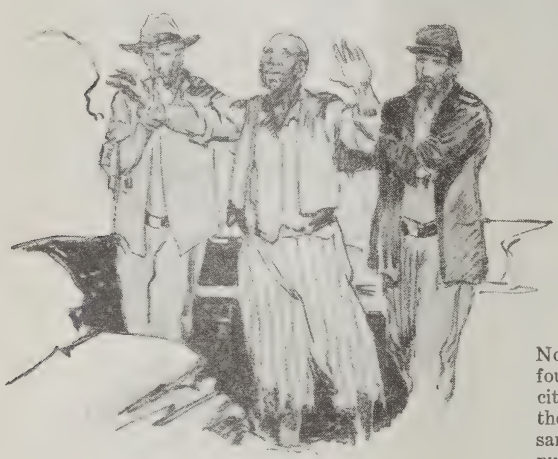
First four forward and back..... 4 bars
All start with right, take two Pas Balance forward, and six Pas Marche back to place.
Side four forward and back..... 4 bars
First four ladies chain with right hand couple..... 8 bars
The first four lead to the right, at the same time the couple on the side move forward to meet them.
Side four ladies chain with right hand..... 8 bars
Head couples moving forward to meet them.
All join hands forward, turn partners..... 8 bars
Turn partners with the left hand.

FIGURE THREE

Star movement..... 8 bars
Four ladies cross right hands, give left hand to partner's right, and promenade around to place.
Gentlemen turn left hand ladies, with the left hand, and return to place..... 8 bars
Using Pas Balance forward and Pas Marche turning.
Pas Balance..... 8 bars
Face partner, each join right hands, shoulder high, and extend toe of left foot to left side (one measure) change hands, and extend toe of right foot to right side (one measure) change hands, and Pas Balance one complete turn, starting with inside foot.

SALUTE CORNER, SALUTE PARTNER, SALUTE ALL, ESCORT PARTNER TO SEAT.

"Good Morning" is the new Ford book on Old American Dances. 75 cents a copy. Send orders to Dearborn Publishing Company, Dearborn, Michigan.



# How the South Regards the Negro

(*Concluded from page 4*)

which the wholesale mixing of divergent races always produces.

It is not for the white man to tell the negro that he should be thankful that he was once a slave; but in all frankness and sincerity, how else than as a slave does he imagine that he could have reached the shores of America? The race has never produced a sea-going craft of its own, and back in those days men were not gratuitously transporting a million men from one continent to another.

If the white race had left the negro in Africa until today when we have outgrown slavery and are trying to feel big-brotherly toward all men, it is certain that, with what we have discovered of the inadequacy of the melting pot, we could never feel big-brotherly enough to bring over ten million negroes to America. And anyhow, the negro race has itself practiced slavery in Africa from time immemorial, and among the outlying negro tribes slavery is today making its last stand.

When the negro's chains were cut, his former master and his liberator led him over the treacherous ground of inexperience to the present day.

Too bad that out of all the harsh things of the past only Southern slavery has left bitterness and depression of spirit. If it will do the negro's feelings any good and help him to take it in a more philosophical spirit, we can remind him that it cost his master far more than it cost him. Though we had paid four billion dollars for the privilege of being the last man to hold the negro's chain, because of our unwillingness to turn it loose when destiny called "Time!" we not only lost all those millions but more blood than all the slaves who ever left the shores of Africa. The negro's sufferings were principally over a hoe, a cane knife and a cotton sack; his white master suffered over a corpse-strewn battlefield, a burned home, a wrecked fortune and a spirit crushed from the haughtiest and proudest among men to the position of taking orders from his former slaves when they were set in political power over him. Surely this evens up the matter of suffering and it ought to help the negro to be at least as philosophical as we about slavery, and the war into which it dragged us.

Whatever the negro thinks about slavery and the deal he has had at the hands of the white race, the facts prove that he is the most fortunate, the most uniquely favored of all people in history. What has actually happened to the negro is this: Providence, fate, or whatever it is that directs the destinies of races (perhaps seeing that the negro was going to make a losing game of it over in Africa with the rapidly expanding numbers and ambitions of those who were crowding into the continent), through the instrumentality of Arab slave hunters, English, Dutch and Portuguese slave traders, New England merchant vessels and Northern and Southern capitalists, lifted the negro from the stagnation and decay of the jungle and placed him in the lap of the civilization which had required two thousand years of the white man's toil and bloodshed to build. Here in the South, under the very highest type of Anglo-Saxon—the wealthy, cultured, intellectual Southerner who ruled men as naturally as he grew—the savage negro was trained, Christianized, taught the manners of civilization and otherwise prepared for the citizenship that awaited him. Then, with the negro doing little more than sitting on the fence and looking on, the North and the South fought a four years' war that the toga of citizenship might be spread on the negro's shoulders. Thousands of white men died to push the negro a little further along the road of progress. When the negro's chains were cut, his former master on one side and his liberator on the other took his hands and led him over the treacherous ground of inexperience to the present day. It is safe to say that had the negro not been given this helping hand, had he been shoved aside to sink or swim, he would today, like the Indian, be counting his numbers by the thousands instead of by the millions.

Outside the white race no people on the globe is in a more favorable position to achieve greatness than the American negro. All over the world are men who would thank their gods for the opportunity of the American negro. All these things destiny bestowed upon the negro for no more effort on his part than a short period of labor, as periods are rated in history. But it is human nature, white as well as black, to lose sight of big blessings and dwell upon the little irritants, and to yearn for the things which are withheld from us.

Why did the African who remained at home fail so signally of holding and developing the continent which had been his since the days of the Pharoahs, even losing, through the cupidity of his own chieftains, the sovereignty of the Congo Free State which the other nations of Europe had agreed to leave as the negro's piece of the African pie? Why has the negro in Haiti, with a very good foundation of the French régime to start with, made in nearly a hundred years of freedom such poor showing in self-government and development? If the negro as a race is an awakening people, why did the slaves in Dutch Guiana who rebelled into freedom slip back one hundred and fifty years to the jungle life of their ancestors instead of making their contack with the white masters a stepping-stone upward? And why the Haiti of today, with its backwardness, its voodooism, its crimes that necessitate outside interference?

The negro must recognize that America has opened to him the door of the future.

# Unique Magazine That "Mac" Built

AWAY out in the Pacific Northwest, where they have one crop a year, lives a man known as "Mac" to more than 60,000 men and women. His right name is R. C. MacLeod.

"Mac" maintains that his claim to fame lies in these facts: That he is the "homeliest man in Washington" and proud of it; unmarried and sorry for it; and that the people of the southeastern quarter of the state of Washington are the kindest-hearted people in the world. The people say "Mac" is famous because he has worked for eighteen years to build for them a publication which tells them of their own and their neighbors' lives, fortunes, businesses and progress. This is probably the only magazine of its kind in America. It pays no attention to anything in the world except what goes on in that region whose commercial, industrial, financial and social center is Walla Walla, where "Mac" lives, publishes his magazine, and is a leader in the community. The magazine is called *Up-to-the-Times*.

*Up-to-the-Times* started with less than $500 in capital. The magazine is published once a month, and is intensely American. It is about eight by twelve inches, and contains sixty pages, as when it was started in November, 1906. There are 38 pages of reading matter, and 22 of advertising. Every one of the twenty-six towns in the district is fully covered by a correspondent, and also by the circulation solicitor.

"Mac's" 146 advertisers, many of whom have been using his columns since he founded the magazine, are all in Walla Walla and the surrounding towns.

When "Mac" came to Walla Walla in 1904, he went to work without pay, on an agreement to obtain a certain amount of advertising for a newspaper in six months or receive no salary. In five months he had obtained more than twice as much advertising as the agreement called for. Then and there, he made up his mind that he could obtain advertising for his own publication, edit it, manage it, and make it a success.

Irvin Cobb, Billy Sunday, and a number of other celebrities have contributed to the pages of "Mac's" magazine, out of admiration for it, and for the Americanism of its creator and owner.

# The Town Lincoln Put on the Map

(*Continued from page 7*)

Concord Creek were inadequate for the mill they desired to erect. This caused a change and brought about the ambitious project of damming the Sangamon River and erecting here the grist and saw mill which was the basic business industry of New Salem. On October 23, 1829, the town was surveyed by Reuben S. Harrison. John M. Cameron held the legal title and the town was recorded with the name of New Salem.

It stood high upon a sightly bluff over the Sangamon River, a full hundred feet above the level of the water. It was a promontory caused partly by a bend in the river and partly by the inflow of a creek. It was beautiful for situation and its name and the religious character of its founders indicated the hope that here was to be not only a town of commercial importance but one also characterized by a fine moral sentiment and a distinctly religious spirit.

A post office was established on Christmas Day of 1829. Samuel Hill was the first postmaster. He served for nearly two years, till November 26, 1831, when he was succeeded by Isaac N. Chrisman. Mr. Chrisman served as postmaster till May 7, 1833, when he was succeeded by Abraham Lincoln, who continued to act in this capacity till the office was discontinued May 30, 1836. There is now a post office in Illinois bearing the name of New Salem, but it is located in Pike County and is entirely distinct from this. Lincoln's New Salem is in Menard County.

The discontinuance of the post office marks the disappearance of the town. The chronological limits of community life between the date of the survey, October 23, 1829, and the discontinuance of the post office, May 30, 1836, is less than seven years. For five of these seven years Abraham Lincoln was a resident of this town. He first arrived on April 19, 1831, and remained until the spring of 1836. It was a highly important period in his life.

In the day of its greatest glory New Salem was a very small town. It probably never had more than twenty-five houses and it is doubtful if any one of those cost more than one hundred dollars. But to Abraham Lincoln it was not a poor, squalid prairie village; it was the largest town he had ever lived in and he was then twenty-two years old. For so small a community it contained a remarkable group of men and women. There were people who could not write their names and some who did not know the names of their fathers, but there were others whose family names stood high in American history.

There were, on the other hand, some who had for the time and for Abraham Lincoln's purpose the quite remarkable educational attainments of Dr. John Allen, the beloved physician, Sunday-school superintendent and temperance worker, Mentor Graham, who taught Lincoln grammar and mathematics, and Jack Kelso, a kind of wandering elocutionist who taught Lincoln to love Shakespeare and Burns and Byron. Religiously it contained the devout Cumberland Presbyterians, Rev. John M. Cameron and James Rutledge, and the turbulent Baptists of the Bale household, and it enjoyed the occasional visitations of that heroic Methodist pioneer, Peter Cartwright. On the other hand, it had a group of radical free thinkers to whom Thomas Paine's *Age of Reason* and Volney's *Ruins* stood for law and gospel. Here came the Clary Grove boys, as reckless a set of hard riders and hard drinkers as could well be imagined, together with men who came up the river "half-horse, half-alligator," while on the other hand there were people eminent for piety and gentle in their saintliness. It was Abraham Lincoln's first intimate contact with organized community life and he had in this simple village a remarkable variety of living examples of widely varying types.

Great as this town seemed to Lincoln and to those who inhabited it and who proclaimed its superiority to Springfield and Beardstown and other nearby metropolises, no one expected it was always going to be a small town. New Salem was a dream city. The vision of its future was based on the dream of a navigable Sangamon flowing outward to civilization with the large products of adjacent farms and bringing back the manufactured products of the industrial world.

We may smile at these ambitious visions of hopes that were doomed before they were born. New Salem at its best was a microscopic town. But we who live in America must learn to estimate cities otherwise than by their size. Athens was a small town in the days of Pericles, and Nazareth and Bethlehem were and are and always have been small towns.

New Salem is associated with many and important events in the life of Abraham Lincoln. To this town he first came as an adventurer on his way the second time to New Orleans. If James Rutledge had not built his dam in a manner unfavorable to the progress of flatboats, or if the waters of the deep snows of the winter of 1830-31 had not so far subsided by the nineteenth of April as to interfere with the flatboat's navigation of the stream, New Salem never would have heard of Abraham Lincoln and we should never have heard of New Salem. Here he lodged, as he afterward said, like a piece of driftwood on the dam of the Rutledge mill, and here he spent those highly important years.

In New Salem, Abraham Lincoln first exercised his franchise as a citizen. Here he cast his first vote in an election held in the house of John McNeil whom later he and the world were to know as John McNamar.

In New Salem Abraham Lincoln had his experience as a business man, first as the clerk of Denton Offutt, then as a clerk in the stores of Chrisman and Hill, and finally as a partner in the disastrous commercial enterprise with William F. Berry which left Lincoln saddled with a heavy debt which he did not wholly remove till 1848.

Here he manifested his prowess as an athlete. He met in free combat all comers and established his reputation not only as the most powerful wrestler in New Salem but also as its fairest referee and supreme judge in tests of strength and masculine skill.

From New Salem, Lincoln went forth to enlist as a soldier in the Black Hawk War. Not on that spot, for the election was not held there, but by the vote of many whom he had come to know in that place and who went with him on that military venture, he was elected a captain and afterward admitted that no office he ever held gave him so much pride.

In New Salem he held his first office under the federal government, serving as postmaster for the period already named, from May 7, 1833, until the discontinuance of the office, May 30, 1836.

In that same town, less than a year after his first arrival, he proclaimed himself a candidate for office. He poled a surprisingly large vote for the legislature, carrying his home precinct, which included the Clary Grove district, by a practically unanimous vote and so nearly succeeding in that first venture as to give practical assurance of his success when he ran again two, four, six and eight years after.

It was not in New Salem but at Vandalia, where the capitol was located, that he framed his first public declaration against slavery, signing with Dan Stone that protest against the action of the legislature

Entrance to old New Salem, which became a cow pasture when a rival town absorbed its business and population.

The two log stores of New Salem as reconstructed.

which has since become famous the world round. While the act was performed in the then state capitol, many of the discussions which lay behind it had taken place in the grocery stores in New Salem.

In New Salem, Lincoln's interest in waterways developed as he worked a summer in the Rutledge mill. There also he developed his ability as river pilot in the care of the steamer *Talisman*.

In New Salem Lincoln had two love affairs. Of his love for Ann Rutledge we know almost nothing and talk much. That beautiful and sweet young woman died August 25, 1835, and we have no contemporary record of it nor allusion to it. Such glimpses as we have of Lincoln in that summer and autumn reveal nothing unusual in his occupation or his state of mind. A letter by his friend, Marsh, written September 17, three weeks after the death of Ann Rutledge, has free mention of Lincoln as postmaster as being careless in his conduct of the office and leaving the mail for people to go and get at their convenience. Marsh expressed a confident expectation that Lincoln could frank the letter he had written and Lincoln did so in a free, unshaken hand. This letter tells of a fearful tornado on August 17, a week before Ann Rutledge died.

We have simply no contemporary record on the Ann Rutledge incident. From a letter of her brother, David, written from Jacksonville shortly before her death, we know that she was considering going to school at the female academy at Jacksonville in the autumn of 1835, and we also know that Lincoln had some thought of the possibility of entering college in that same autumn. He owned a book of Greek exercises which he apparently purchased at this period, and he weighed the advantages and the costs of a possible college education, but we have not a scrap of written evidence concerning Ann Rutledge and her love for Abraham Lincoln and his for her for more than thirty-one years, and we have the best of reasons to believe that much of that is unreliable.

Of his love affair with Mary Owens, a few months later, we have abundant evidence. We have Lincoln's letters to her and his own very full account of the affair in his letter to Mrs. O. H. Browning. We also have Mary's detailed narrative in writing. It is a little remarkable, but on the whole characteristic of much of our writing and oratory that we say almost nothing about Lincoln's love for Mary Owens, a proud, handsome, well-bred, well-educated young woman, and that we talk a great deal of the other matter on which our evidence is so scanty and that mostly wrong. However, we shall make no mistake in standing reverently by the grave of Ann Rutledge, which is no longer in the Old Concord Cemetery, but is near at hand in the village of Petersburg. We may remind ourselves, however, that Ann Rutledge did not die in New Salem, but in the earlier farm home at Sand Ridge, near Concord Creek.

New Salem was Lincoln's alma mater. Here, as we have reminded ourselves, he studied grammar and surveying and literature. Here also he acquired his first set of Blackstone and read law. He obtained that knowledge of the common law which enabled him to secure admission to the bar and formed the basis for his professional career.

Lincoln came to New Salem a stranger, he left with a host of friends: he came with his capacity for leadership untrained, he left having established his power over men in military and civil affairs. He had triumphed in the free arena where men match physical strength, and in intellectual contests where he showed his mastery of mind. Here he thought through many of his life problems. He went forth lonely and in debt with many years of struggle ahead of him, but for those years and for that struggle he had been well prepared by this period of his life in New Salem.

Of all the various and widely separated hamlets associated with the memory of Lincoln through his successive residences in Kentucky, Indiana, Illinois and Washington, and his journeys as far westward as Kansas and east to New England, there is none that thrills the historian with such diversified interest as the little rebuilt hamlet of New Salem.

Hodgenville brings us in reverent awe to the place of his birth. Washington cherishes the room where he died in the hour of his triumph. Gentryville honors the scene of his lusty youth, and his own city, Springfield, has innumerable associations with his domestic and professional career.

The seven cities where he matched strength with Stephen A. Douglas, the twice seven county seats of the eighth judicial district, and the places where on occasion he addressed assemblies large or small, thrill each of them with its own cherished recollections of him. Beardstown, where his plea saved a widow's son from the gallows, and Gettysburg, where he uttered in immortal words an imperishable tribute to her honored dead, still echo with the memory of his eloquence. But no one place appeals to so many emotions or touches us at so many points of interest as New Salem.

Fitting it is that the slab sides of the Lincoln-Berry store should rise again upon their original foundations; that the log walls of the Rutledge tavern should stand in their mute eloquence; and that one by one the humble habitations of Old New Salem should rise in counterfeit presentment of their former selves; for on this spot as nowhere else on earth the fragrant memory of Abraham Lincoln lingers amid the prairie flowers above the placid flow of the Sangamon. There reminiscence and romance blend with living memory to paint with vivid colors of lasting reality the name and fame of Abraham Lincoln.

# The Passing of a Great Nation

STRIPPED of scarlet robes and eagle's feathers, the last of the Catawbas, sole survivors of the once powerful Catawba Nation, still linger on ancestral ground on the banks of the Catawba River in York County, South Carolina. There are only about a hundred Indians left now to greet the stranger within the gates of their reservation, yet their daydreams appear to be as roseate as ever. And they cannot forget the glories of Chief King Haiglar or the thrilling days when they were supreme on the headwaters of the Catawba and Santee rivers, over an area as large as that over which a crow could fly in a day, and when no white man nor red man dared to visit the territory of the Catawbas, except by invitation of the masters.

The Catawba Indians present a wonderful example of faithfulness and devotion to the American people, in spite of the fact that history has ignored them, and the white folks among whom they have lived have mistreated them by breaking faith, times without number. The present Catawbas are descendants of the great race which once made the woods of the Carolinas ring with the war whoop as they went forth against the enemies of the early settlers. Yet they have been oppressed, have dwindled away unnoticed and unhonored until now, the very fact of existence of an Indian in South Carolina is apparently not generally known, even in counties touching the Catawba reservation. Even the school textbooks of the present fail to mention these descendants of the earliest-known inhabitants of the state.

The 225 square miles of land that was confirmed to the Catawbas in 1764 has gradually been curtailed until now the reservation contains less than 600 acres! It is in a remote part of the state, where the peaceful stillness of the forests has not yet been disturbed. Of the less than one hundred members of the tribe still left, some are of mixed Caucasian and Indian blood.

The Commissioner of Indian Affairs holds the Catawbas are citizens of South Carolina, yet they do not vote and they pay no taxes. They have virtually no form of tribal government at present. They elect a chief every four years, but this official is merely an adviser. Though they have few laws, they have no need of jails or courthouses, being quiet and peaceable and bloodshed almost unknown.

When the Catawbas work, which is rather seldom, the chief occupation is the making of pottery, earthen ware and pipes. These articles are made in primitive style. They are all shapes and sizes.

UNIV OF ILLINOIS
URBANA ILL

WE ARE called upon to cherish with high veneration and grateful recollections the memory of our fathers. And surely no nation had ever less occasion to be ashamed of its ancestry, . . . for while most nations trace their origin to barbarians, the foundations of our nation were laid by civilized men, by Christians. . . . And yet not unfrequently, they have been treated as if they had no virtues; while their sins and follies have been sedulously immortalized in satirical anecdote.

The influence of such treatment of our fathers is too manifest. It creates, and lets loose upon their institutions, the vandal spirit of innovation and overthrow; for after the memory of our fathers shall have been rendered contemptible, who will appreciate and sustain their institutions? The memory of our fathers, should be the watch-word of liberty throughout the land; for, imperfect as they were, the world before had not seen their like, nor will it soon, we fear, behold their like again. Such models of moral excellence, such apostles of civil and religious liberty, . . . constitute a censorship inferior only to the eye of God; and to ridicule them is national suicide.

—*Henry Ward Beecher.*

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the one-sidedness in business which results from the undue exaltation of one subordinate factor.

---

Religion is the opium of the people. Morality is bosh. Rules of conduct, ethical standards, reverence for sacred things—all are sheer nonsense—cunning devices by which the powerful classes rule the people. Socialists profess to believe rubbish such as this. The statements comprise the fundamental tenets of Marxianism. They explain why so many Americans regard Socialism with impatience. (p. 4)

---

A thirteen-month year—how would it appeal to you? The League of Nations would consider changing the calendar and making the year consist of thirteen months, twenty-eight days to the month, a world holiday each year and Leap-Year Day once each four years. Many business men, scientists, favor it. Thomas L. Masson writes about it. (p. 3)

---

In his article Mr. Masson tells us other interesting things: that the "30-ton arrows" of the Druids, the obelisks of the Orient, the pyramids of Egypt were in reality observatories whereby ancient astronomers foretold the coming of the seasons; that American Indians had unique methods for measuring time; that Methuselah's "years" were moons.

---

*Woodrow Wilson used his friends as he did his books*—putting them aside when he had no further use for them. But this was not discourtesy; he merely filed them away in his mind until he should again have need of them. Those who did not understand were affronted; they felt they had been shabbily treated, and the world sometimes agreed with them. The rather brusque trait was only another example of the methodicalness of the War President's mind. (p. 2)

---

World's records are broken in the laboratory, not on the field of sport! More home runs than ever before? *A livelier baseball is the answer.* Javelin record shattered? Compare the new shaft with the old. A record of nine seconds flat for the hundred-yard dash probable in the future? The secret is in the track shoe. (p. 16)

mill)ions of aflickf)litter ing bright million of S hurl—This isn't a pied line; *it's a poem!* At least self-revealed members of the intelligentsia insist it's a poem. A few weeks ago Charles J. Finger wrote of the *Spectra* hoax, wherein two authors took the literati into camp with a book of nonsensical verse which had a mysterious "hidden meaning." Here he again follows the trail of the literary fakers. (p. 12)

---

In the beginning there was gold! Then some unsung Californian discovered climate. Oranges, real estate and movies followed in quick succession. And then last, but by no means least, came oil. Small wonder native sons are forever bragging about golden California. (p. 20)

---

The Reconstruction was a critical period for the South. Serious difficulties arose, that seemed almost insurmountable, but the people struggled through. Its effects, however, are still felt. This article, the second by Townsend Boyer, is presented, not as an indictment of the North, but as a clear exposition of the attitude still held in the South concerning one of the most precarious eras in American history. This attitude has an important bearing on the present-day Negro Problem. (p. 7)

---

Cultivate soil and soul together. Your boy has a natural, instinctive desire for contact with primitive earth. It is inborn, inherent with the race. Teach him to grow things, to work with his hands as well as with his brain. It will help him physically, but far more important than this, it will help to develop his principles, to mold his character. (p. 8)

---

Egypt lives again in the discoveries of the archeologists. The Pharaohs move and speak and die; they tell us their secrets, buried for centuries, their sorrows, their triumphs. From crumbling stones we learn of Ikhnaten, who believed in one God alone, and of Tut-ankh-amon, his son-in-law, a weakling king, and of the latter's wife, who lost the throne after her husband's death because of the cowardice of the Hittite ruler. (p. 5)

---

A white man's country—that's what they call their commonwealth in Australia. Rigid immigration restrictions, probably the strictest in the world, are in force. Only those of Anglo-Saxon stock are welcome, and the privileges of colonization are not extended to others. How do these regulations affect the "island continent"? (p. 15)

---

What did the liquor hearings amount to? Nothing. There was talk, talk, talk—but it didn't mean anything. Even the "wets" failed to find much solace in it. The nation as a whole wearied of the proceedings long before they dragged themselves to an end. (p. 10)

---

*Build your home by the cubic foot.* If you have only a certain sum to spend, remember that there is a direct relationship between quality and size. The greater the quality the less the area; and the greater the area the less the quality. If you plan carefully before you build, the results will be far more satisfactory. Mr. Wood, author of this article, is a well-known architect. (p. 32)

# Woodrow Wilson, Who Filled the Unforgiving Minute

PART VIII.

By HUSTON THOMPSON

Copyright, 1926, Huston Thompson.

(C) International Newsreel.
President Wilson as he was preparing to quit his journey across the United States and return to Washington. Although broken in health, he is trying hard to smile.

BY far the most striking of Woodrow Wilson's varied characteristics was his complete control and regulation of the operations of his own mind. Most men follow the course of least resistance in their thinking, in the application of their mentality to their problems. Wilson did no such thing. He handled his mind almost as if it were a mechanical engine, which he could start, stop, and guide to right or left at will.

Early in life, Woodrow Wilson was trained to think and to express himself by his father, a Presbyterian minister, who would allow no scatter-brained looseness in the schooling of his children. Woodrow (then called by his first name, Thomas) was not sent to school until he was nine and until that time he had not learned his letters, but he had been instructed insistently in the use of his mind.

"My father would not allow me to express myself carelessly or to burst forth with a jumble of words in excitement," Mr. Wilson explained, in speaking of his early education. "If I started off on any such tangent he would say, 'Wait a minute, Thomas. Steady. Take your time. Think! Think! Don't go off half-cocked. What is it you want to say? Stop and get straight in your own mind what you want to tell me. Then select the words that express your thought, clearly and simply.' "

With such a foundation, Mr. Wilson early in life developed into a straight thinker. He was naturally of a systematic, orderly nature. As a very young man he learned the value of knowledge and was appalled at the frightfully short span of life in which to acquire knowledge to fit oneself for one's life work and to accomplish something worth while. He became a voracious student.

To one studying the speeches of Mr. Wilson that were delivered back in the days when he was a professor and later president of Princeton University, the thought continually recurs that even then he had in mind the White House as an ultimate goal. These addresses are so full of public questions handled in a statesmanlike manner, that they impress one as the utterances of a man imagining himself in the thick of political battle, rather than an academic discussion.

Moreover, back in his teaching days, Mr. Wilson was forever pressing the "unforgiving minute" with studies of government. He also used the fleeing days teaching himself practical politics.

If Woodrow Wilson had deliberately set about to fit himself for the Presidency of the United States, his training could hardly have been more appropriate. Because of his lifelong mental habits, and his serious point of view toward his responsibilities, he was, in the words of Rudyard Kipling, prepared to

". . . fill the unforgiving minute,
With sixty seconds' worth of distance run."

Wilson was essentially thorough, accurate, and systematic. There was not the slightest hint of the slipshod in anything he did or said. His desk in his office in the White House was neat and orderly.

He lived and worked methodically. His mind worked like lightning. Trained to concentrate, he could dispose of one case after another in an unbelievably short space of time. He also required that all those about him be methodical, accurate and rapid. If it had not been for these characteristics his burdens during the war would have been crushing. It was because of them that he was a constant source of amazement to his associates and subordinates, who never became accustomed to his knowledge and grasp of the subjects which they took up with him.

"I was Attorney-General for six years," said Thomas W. Gregory recently, in discussing this phase of Wilson's character, "and during that time I

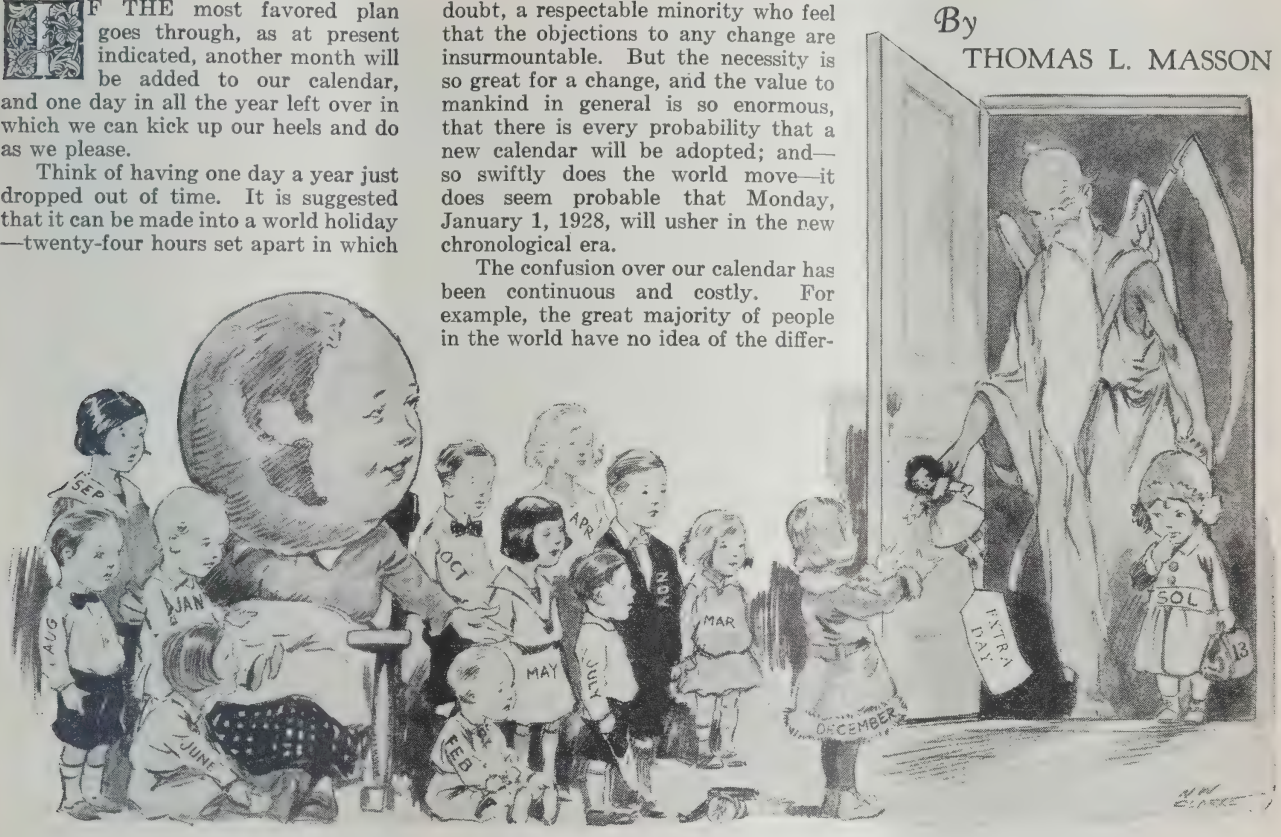
# A Year of Thirteen Months?

## Plans Are Ready for a New World's Calendar With Months of 28 Days

By THOMAS L. MASSON

IF THE most favored plan goes through, as at present indicated, another month will be added to our calendar, and one day in all the year left over in which we can kick up our heels and do as we please.

Think of having one day a year just dropped out of time. It is suggested that it can be made into a world holiday—twenty-four hours set apart in which we can forget our troubles, think of peace, prosperity and universal love.



Then again, every four years there will be another day, thus disposing of that extra day in February we have now as leap-year day.

Father Time, if all goes well, is going to repent of his long list of chronological errors, and on Monday, January 1, 1928, will come forward in his new rôle as the only and original efficiency expert.

We shall all be able to figure up our interest charges without any difficulty. Already most of the nations on earth have agreed, the National Chambers of Commerce have approved of the general reform, and there seems to be no doubt that our calendar will be revised on a more practical basis, no matter where we are. "Whether where equinoctial torrents flow or winter wraps the polar world in snow," there will be seven days in every week, four weeks in every month and thirteen months in every year, instead of the imperfect twelve we have been running upon so far.

The problem has not been an easy one to solve. Among those people who have looked into it, there is, without doubt, a respectable minority who feel that the objections to any change are insurmountable. But the necessity is so great for a change, and the value to mankind in general is so enormous, that there is every probability that a new calendar will be adopted; and—so swiftly does the world move—it does seem probable that Monday, January 1, 1928, will usher in the new chronological era.

The confusion over our calendar has been continuous and costly. For example, the great majority of people in the world have no idea of the difference in wages between payment by the week and payment by the month. In New York City, quite recently, women garment workers struck for $10 a week when they had been offered $56 a month. They did not understand that the latter was more than the former. Apparently they thought that ten dollars in hand every week was more than to wait a month to get more than five times as much.

Father Time, if all goes well, will come forward with another month between June and July, to be called "Sol," and one day more.

Practically every problem that comes up before us is an economic problem. Yet, almost startling to relate, when we trace it back, we find that it rises from human relationship; that is to say, the two things are inextricably intertwined.

For instance, most persons think that the great pyramids of Egypt were built as the tombs of certain kings, yet it is now asserted that they were built as enormous sundials, to measure accurately the march of the seasons, so that the greatest number of crops could be produced in a given year.

The Egyptians were hard put to it. Their land was sunny and fertile. The Nile overflowed its banks at regular intervals, which made the surrounding land extraordinarily valuable as a crop-producing area. New and powerful nations were constantly rising up in the north and east and swooping down upon those favored people. To preserve their very life, those ancient Egyptians had to produce large armies, and to produce large armies meant increasing crops. The priests, who were the students, studied the problem, and by means of the pyramids were enabled to make such exact measurements that *they could tell the FARMERS PRECISELY THE DAY, ALMOST THE HOUR, to plant.*

It can easily be seen that the difference of one more crop a year between the old schedule and the new one which the scholars were able to devise through the pyramids might make the difference between life and death for a whole nation. It was not then so much a question of birth control as it was of human production, though in either case the problem is economic. As for the human relationship, that is shown very clearly, not only in the case of the Egyptians, but all through history.

At the apex of the pyramids was a hole, and this hole acted upon the sky very much as one of those modern pencils does, without (Continued on page 25)

# Socialism With the Bark Stripped Off

## Showing Up Marxian Theories on Marriage, Religion and Property Ownership

By GEORGE McCREADY PRICE

IN THE early days of the Soviet triumph in Russia, it was telegraphed all over America that the women of Russia had become national property. Aside from the incidental fact that this statement was not true, it might have occurred to most people, one would think, that the women themselves might have something to say about such a plan.

But this telegram indicates the general opinion about a social system that is known to be planning to nationalize everything capable of treatment in this manner. The very fact that such a canard could be telegraphed half around the world, and actually be believed by millions of people, indicates that this report was considered to be quite in keeping with the tenets and the professed aims of the Soviet leaders. Not even the most enterprising of reporters would risk the cable tolls on a similar report about the government of Mexico, or China, or New Zealand, or Timbuktu. Why make such a report about Russia; yes, and actually get away with it?

*Marxian Views About Marriage*

Marxian Socialists, the only people who ought to be called Socialists, have long been known to hold views about marriage which are very different from those commonly held by other people. But their views about marriage are quite consistent with their other views about conduct (or ethics) in general, which are also very different from the views prevailing among what are commonly termed civilized peoples. Their teachings about stealing, and lying, and murder, and all the other crimes listed in the law books are also very different from those held by other people.

All this grows naturally out of two very fundamental ideas which lie at the basis of all the teachings of Karl Marx and his followers, namely, the "economic interpretation of history," and the doctrine of the "class war." It will be in order to say a few things about each of these ideas.

*A Proletarian System of Morals and Ethics*

The economic interpretation of history is a purely materialistic philosophy, and is also called "economic determinism." This means that, according to this view, man's entire manner of life, his political systems, laws, customs, even his systems of ethics and morals and religion, are all produced entirely by the economic systems under which mankind has grown up. Man's entire political and social life (so runs the theory) has been made by the methods he has adopted of getting a living. And as the world has hitherto been getting along under what is termed the "capitalistic system," the socialists say that all our ideas about conduct, such as those about property rights, or about marriage and the family, are obviously the products of the present capitalistic system.

All such ideas are therefore said to be an expression of "capitalistic morality," growing out of the cunning devices of those in control to keep the capitalistic system running smoothly; and that when we throw away this capitalistic system we must also scrap the entire system of morality and social conduct which has grown out of it, and set ourselves to work out a new system which will have nothing of the taint of capitalism about it. Only by destroying completely the entire system of ethics and social life which capitalism has produced, it is said, can we hope to reform society on a proletarian basis. The capitalistic morals and ethics must give place to a distinctively proletarian system of morals and ethics, or the new social order cannot be expected to be permanent.

*"The Opium of the People"*

This indicates the reason why all Marxian Socialists take pains to express their contempt for the ordinary Christian ideas about marriage, about property rights, or about many other rules of private and public conduct which we have long considered essential to the well-being of civilized society. If what we term "right" and "wrong" owe their distinctions entirely to a system of mere capitalistic morality, what more natural for a true Socialist, one at war with Capitalism, to be also at war with all the current ideas of "right" and "wrong"?

Of course, under such a system of Socialism there is no room for the idea of God as the supreme source of morality. In America and Europe, the doctrine of a Supreme Being, to whom all are ultimately responsible, has consciously or unconsciously moulded all our ideas of conduct, all our social and even our civil laws. But Socialism calls religion "the opium of the people"; and throughout the world it has always aimed to eliminate all such ideas of moral accountability from the minds of the people, telling them that all such notions are the sheer products of capitalism, invented by their exploiters for the purpose of keeping the masses more directly and more completely under their power.

With such a view of human conduct, it is quite natural for Socialism to teach that morals and ethics do not have anything to do with man's private conduct; only his social, or that part of his life which affects others, matters at all. Hence such acts as gluttony, bestiality, or the nameless forms of personal impurity, are of no more ethical importance than the way he combs his hair or the way he shaves.

*Some Opinions About Marriage*

In regard to the marriage ceremony, August Bebel, the leading German Socialist, in agreement with all the other leaders of this cult, intimates that it is quite superfluous and will under the Socialist régime be disregarded. For he pictures the future conditions of the relations between a man and a woman in the following language:

> "The contract between the two lovers is of a private nature, as in primitive times, without the intervention of any functionary." (*Woman Under Socialism*, p. 154.)

And Morris Hillquit, another leading writer on this subject, admits that such "marriages" will have little permanence about them; for he says:

> "Most socialists therefore favor dissolubility of the marriage ties at the pleasure of the contracting parties." (*Socialism: Promise or Menace?* p. 163.)

However, we are not left to abstract theorizing on this matter, for Soviet Russia has shown us how these questions are solved in actual practice under the Socialistic scheme. For "marriage" is simply a matter of having the names of the two parties entered in the big register at the city hall; while next day, if they so agree, the same persons can have their names entered side by side in the divorce book; and that is all there is about it.

Now if, as the Socialists claim, man is wholly the product of his environment, one might well suppose that two or three generations of such a system of society would result in effectually eradicating all previous conceptions, and would insure the following generations against any danger of reverting to any such system of ethics and morality as now prevail under our "capitalistic morality." And the system of atheistic and anti-moral education now carried on in Russia would serve to make the eradication of all lingering traces of Christian morality absolutely certain.

*A System Which Roosevelt Condemned*

One can understand why Theodore Roosevelt indignantly declared that such a condition of affairs as would thus result would "bring about the destruction of the race within, at the most, a

(Concluded on page 18)

# New Light on Old Egypt

## Land of Moses and the Pharaohs Gives Up Its Secrets to Modern Research

By WILLIAM E. BARTON

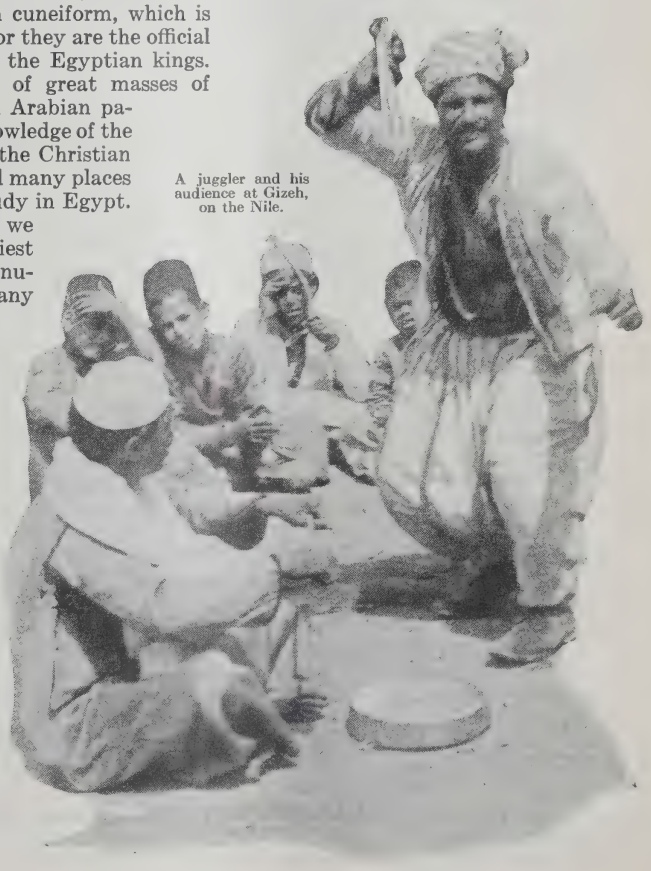
Photographs, Ewing Galloway.

Tea in a Cairo garden, near the Pyramids.

EGYPT is no longer the land of darkness. Upon her are focused not only the rays that cast their radiance from the lamp of learning, but also the spotlight and calcium flare of journalism. Any morning now for the past two or three years, save only in the closed season of summer when Egypt takes a siesta, one might expect some information in the daily press about the land of Moses and the Pharaohs, and often that news has made the front page.

Explorations go on in other parts of the world. Assyria, Babylon, Carthage and Cyprus, to say nothing of Herculaneum and Pompeii, are forever sending antiquities to the museums, and there they gather dust for the learned or the curious. But Egypt has a new place in the sun. The public wants to know about Egypt, and the public is getting knowledge almost every day.

There is new light about Egypt, and there is new light from Egypt. Within the past few years there have come to us from the land of the Nile important additions to the world's knowledge of three different periods, separated from each other by nearly five millennia. Briefly they are these:



There is light on the early history of civilization. We think we have found a calendar in Egypt of the year 4241 B.C. That is 6,167 years ago, and it may be remarked in passing that six thousand one hundred and sixty-seven years is a long time for recorded history, however recent it may be as compared with astronomical time.

The discovery of the tablets at Tel el Amarna, in 1888, affords us exact knowledge on the learning and much information about the politics and religion not only of Egypt but of surrounding lands, in the century just before Moses. These tablets, some three hundred in number, are written in the Babylonian cuneiform, which is an amazing fact, for they are the official correspondence of the Egyptian kings.

The discovery of great masses of Greek, Coptic and Arabian papyri, affords us knowledge of the early centuries of the Christian religion, which had many places of worship and study in Egypt. It is possible that we have here the earliest extant bits of manuscript containing any portions of what later came to be incorporated in the New Testament.

But interest does not center exclusively upon these three points. There is wide room between for research, and the spade is having little rest on the banks of the Nile.

My own recent trip to Egypt was my second, the former having been in 1902. Almost twenty-four years had intervened between the two visits. On that earlier visit I landed at Alexandria, and there embarked, having in the interval traversed the Delta to Cairo and ascended the Nile to Luxor. On this more recent journey I landed at Suez, and embarked at Port Said. This afforded opportunity to travel the length of the Suez Canal, though mostly by the more rapid and less wearisome means of the railway, view the Bitter Lakes, form a theory about the place of the crossing of the Dead Sea by the people of Israel, ascend the Wady Tumilat, the route of the Exodus, pass through, and on two sides of the triangle that bounded the land of Goshen, and reach Cairo in time for a good supper at Shepheard's hotel.

A juggler and his audience at Gizeh, on the Nile.

As far as I am aware, the two places on earth where one may see most of varied life in the shortest possible time and most interesting fashion are the veranda at Shepheard's and the Galata bridge in Constantinople. In front of Shepheard's, with snake charmers and magicians and dancing girls, and with cracked ice and soothing liquid in a tall glass, life does not seem wholly a failure. I hasten to add that Volstead himself could find no fault with the contents of my glass.

Antiquities are for sale, here and everywhere. If you ask for it, they will bring you anything smaller than a temple or a pyramid or some such trifle, and will describe eloquently its virtues and its antiquity almost as well in front of Shepheard's as anywhere. It might appear hardly worth while to stir from there, to lame your joints climbing the pyramids, or to endure the discomforts of riding on donkeys and camels, when everything is at hand. However, there are snake charmers and magicians and antiquaries elsewhere.

Valley of the Tombs of the Kings of Egypt.

I was riding my donkey on the way to the Valley of the Tombs of the Kings. A native came alongside and offered me a scarab.

"Very good," he cried. "Genuine, antique. Time of Rameses the Great. Very cheap. Three pounds, fifteen dollars."

I gave it not even a casual examination. I did not so much as put on my glasses to discover if I could form a judgment concerning it. I told him I did not want it.

"Cheap, very cheap," he said. "If you no give fifteen dollars how much you give?"

"One piaster," I replied. That is a coin of the value of five cents.

"Take it," he said. "I have others at the same price."

I took it. It was worth every cent I paid for it. It would have cost me more at Shepheard's, and it was worth more to get it in the way I did.

Genuine antiquities are still to be had. The Cairo Museum has some for sale. But it is a poor lot in quality, however desirable for antiquity. They keep the best, give the next choices to the museums of Europe and America, then show what is left to special scholars, and what remains for the public is a poor enough lot of antiquated junk. It is better to buy outside, if one can be sure of getting the real thing.

In recent years, exploration in Egypt has been mainly in the region about the site of ancient Thebes. It was not always so. The Rosetta stone was discovered at the very mouth of the Nile, in 1799. It was this by-product of the Napoleonic Wars that unlocked the closed door to a knowledge of the Egyptian hieroglyphics. The region inhabited by the Israelites in the fertile land of Goshen yielded knowledge of the treasure cities of Rameses and Pithom. Sakkarah, and the site of ancient Memphis, once the seat of mighty power, and situated only a score of miles from that center of all things, Shepheard's hotel, has yielded rich treasures. Oxyrynchus and Tel el Amarna, both on the way up the Nile, have enriched the world with unexpected knowledge. But since the discovery of the royal mummies of the greater kings of the eighteenth and nineteenth dynasties, in the last quarter of the 19th Century, the greatest eagerness has been manifested in recovering the remaining tombs of those two families of kings.

It was not a lucky accident that led to the discovery of the tomb of Tut-ankh-amon. It was known that this one tomb must be somewhere in the valley with the tombs of the greater kings of that eighteenth dynasty. His father-in-law, Ikhnaten, removed the capitol from Thebes, and his tomb was naturally near his own new capitol, named for himself and identified. But Tut-ankh-amon moved back to Thebes, and his inscription is legible on the walls of the Temple of Luxor, telling how and why he did it. I saw it there twenty-four years ago, and it was then a matter of feeble concern. I saw it again on this recent visit, and it was a matter of chief interest. His tomb was sought with more definite and methodical investigation than can always be expected. Lord Carnarvon, whose own personal interests were more with horse races than with Egyptian antiquities, was interested and willing to furnish money. He died in the accomplishment of his quest, but he died successful.

Interest still centers in the Valley of the Tombs of the Kings, but the last known royal tomb has been found. The tomb of King Tut was the last. And it is now empty. Little did I think when in 1902, I walked the length of the galleries of the tomb of Rameses VI, that I was treading above the head of another, although lesser, king, whose discovery a few years later would set the world talking. And now, as I bestride a donkey for another ride to that familiar valley, I meditate with solemn reflection that King Tut has gained more publicity than any one of his far greater predecessors. And yet I do not wholly despise King Tut.

I suspect he owes his popularity in no small degree to the fact that his full name is so difficult and his newspaper name so easy to pronounce. I have had more frequent occasion than most men to use his full name. Tut-ankh-amon is still a difficult name to speak, but how easy it is to say "King Tut."

What do we know about Tut-ankh-amon? Our actual knowledge is not great. We do not know whether he had in him any royal blood, or whether he became a king by right of his marriage to Ankh-es-en-pa-Aten, third daughter of King Amenophis IV, of Ikhnaten. That heretic king had daughters but no son. His first daughter, Mert-Aten, married Smenkh-ka-Re, and her husband probably died. The second daughter, Makt-Aten, died unmarried. The third daughter married Tut-Ankh-Aten while she was a mere girl, and he at that time was so named in recognition of the sun-god Aten, whom Amenophis III had made the sole (Continued on page 27)

# Reconstruction and the Negro Race

## South Tries to Forget the Troubles That Followed Its Rehabilitation

By TOWNSEND BOYER

ILLUSTRATED BY J. C. GRAHAM

OFTEN the work of the soldier on the battlefield is lost or nullified by the politician or the seeker after special privilege; many historians credit the quarrel between President Johnson and Congress with doing more harm to the spirit of nationalism and the economic situation in the South than did the Civil War itself. Having lost the war we expected nothing but to accept defeat and adjust ourselves to the new order, but the Reconstruction was felt to be an unjustifiable and unchivalrous abuse of a fallen foe, and inimical to the Anglo-Saxon instinct of fair play.

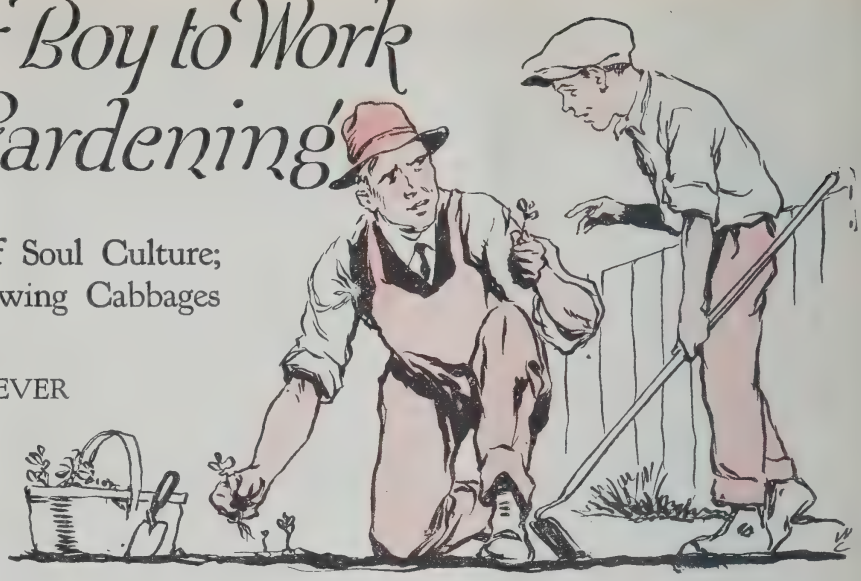
The uncertainty and hysteria that follows war, which in this instance was intensified by the assassination of Lincoln, caused conditions favorable for this quarrel to assume the proportions of a national calamity.

To realize that the South meant to take its defeat in proper spirit and to do the right thing by the negro we have only to consider these historical facts: not the Emancipation Proclamation, as is popularly supposed, but the Thirteenth Amendment was the act that officially set free all the negroes in America. The proclamation set free only the negroes in certain states. This is not to suggest that Lincoln did not intend eventually to abolish this national irritant and menace, though it does bear out what we have come to believe of Lincoln, that the preservation of the Union was at all times the thing that held the greatest interest of his heart.

Upon his accession to the Presidency, Andrew Johnson, wishing to carry out Lincoln's plans of accepting back into the Union with as little ado as possible the seceded Southern states, granted with a few negligible exceptions a general amnesty and permitted the states to organize new governments and elect new Senators and Representatives to the Congress that was to meet in December. Without a murmur these new state governments ratified the Thirteenth Amendment, freeing every negro in America.

Unfortunately these Southern people, realizing what they were facing with four and a half million negroes who were without means and were cut loose from all restraint, had passed vagrancy laws in order to have some sort of legal control over the situation. Immediately these laws were interpreted in the North as a direct blow at the negro's sorely bought liberty and were destined to be a firebrand in the highly inflammable state of national feeling.

Meanwhile the Freedmen's bureau, created even before the battle flags were furled to "give relief to refugees and freedmen," was hopelessly confusing and irritating the race situation. No doubt that in its conception and purpose the Freedmen's bureau was noble and worthy; it gave needed relief and it established some schools for both white and black children. Many Southern people remember with gratitude those noble men and women from New England whose schools were the one bit of helpful neighborly work in that time of bitterness and distrust. But these blessings did not offset the damage done to the South by creating an intense race feeling, the effects of which are felt to this day.



Congress gave this bureau almost arbitrary power in managing the affairs of the negroes, a power that was greatly abused and misused. It stood between the negro and his white employer, presumably to see that the negro was treated right, but there was extortion and bribery and endless confusion. Many of the bureau's officials deliberately filled the negro with hatred and distrust of his former master, a thing not difficult to accomplish under the circumstances. They inculcated dangerous political ambitions and social hopes and helped the negro to acquire a taste for idleness and unearned luxuries and to expect endless gratuities from the government that had already done so much; they organized the negro into secret political societies and taught him to use the weapon of the strike for higher wages. To augment the damaging influence on the negro, much of this manna that was falling into his life was from the bankrupt and confiscated property of the Confederacy.

Many of the Freedmen's bureau officials deliberately filled the negro with hatred and distrust of his former master.

It needed but the Fourteenth and Fifteenth amendments, granting full citizenship and unrestrained suffrage to the negro, and the Reconstruction Act, disfranchising the white people who had given aid to the Confederacy—naturally all the best class of white people—to complete this witch's brew of trouble. Seeing rich pickings in the unprecedented situation of a semi-barbarian people in political power over (Continued on page 30)

# Teach Your Boy to Work Through Gardening

## Soil Culture Is But a Part of Soul Culture; Character Comes With Growing Cabbages

By
WILLIAM A. McKEEVER

IT IS my theory that industry is a great human instinct; that the basic industries, in which the masses are engaged, are soil culture, manufacture, transportation and selling; that the rudiments of these should be taught to all the young alike to humanize them; that the industrial training of the child of any age should always have reference to the production of character and not the production of goods; that to deny the young his brief participation in any of these great trunk-line industries is partly to suppress his nature and to cause him some kind of ill in his later life.

Teach your boy to work in the soil. Nature gave him an inherent hunger for contact with the primitive earth and for making things grow out of its elements. Satisfy this instinctive desire as best you can and you thus make him familiar with one of the mighty and endless race practices. In so far as you also humanize him, render him sympathetic with the conditions and needs of mankind and lay a foundation for his later success in his chosen calling. It is the soft, under-developed, inexperienced, uninitiated boy who later will look for an opportunity to cheat, to practice graft, or to get something for nothing.

If the sunlight is available in the place where you live, you may have a garden. You may hang a box of earth, measuring half a foot by two by three feet, out on the window sill, and by means of this, teach your child the simplest elements of soil culture. You may show him how seeds are germinated, and how to produce a few handfuls of staple vegetables. From experience with this tiny thing he may later develop into a farmer or a food producer of some specialized class. Put in some lettuce, radishes, onions and cress. If you care to go to the trouble of making one side of the box of glass, you and your child may actually watch the development of the roots and tendrils of the growing plant.

It is often merely a lazy excuse of city parents that they have no opportunity of teaching their children soil culture. Within the limits of even the large city, or along the border of it, there are thousands of vacant lots and unoccupied spots whereon something might be grown. During long summer evenings and Saturday afternoons, one may go with a boy and make a semi-picnic out of a valuable garden project. I have not only tried this matter and proved it, but I have also conducted state-wide campaigns for the purpose of putting it into effect on a large scale.

You may begin as late as the first week in June, you may have the commonest of soil—practically pure sand or clay or dump material—and manage from this to produce a very good garden. Water, sunlight, and care will do the trick. Last summer I tested out a slender city boy of thirteen. After June first, and on a sandy, wind-swept lot where people thought nothing could be grown, he produced radishes, onions, corn and tomatoes enough for a family of four. All he needed was a plan, a few simple tools and a bit of inspiration from dad, to make the matter one of education and delight. A piece of ground twenty feet square will do much toward feeding the family, as far as fresh vegetables are concerned.

*A City Boy Who Grew Enough for Four Persons*

The clubs of boys and girls of the country have formed themselves into a miniature republic, with cabinet officers and other officials. This is the right idea, for it connects the social and the civic interests with production and economy. But the city boys need something of this kind even more. Think of the idea of a 16-year-old lounging around a beach during the busy summer days. His next higher step is "cake-eater." But it is possible to organize town and city boys into garden clubs for the summer vacation season, with social, economic and "swimming-hole" practice combined with the soil culture. Baseball and other athletic games will also fit into the program.

Employ a man who combines the qualities of the teacher and play leader. Put him on full time, and make him director of the vacation activities of the boys of a given class and neighborhood. Include gardening singly or by groups, or both forms; also connect the affair with play, recreation, hiking, camping and business enterprise. Make it an all-inclusive program, such as will account for practically all the spare time of the boys enlisted. Thus you will do the parents a great favor and the character of the boys a greater one. I have indirectly organized hundreds of such clubs. In many instances the boys have conducted a general sale of their produce on the local market. In others, they have made one big clean-up sale of something like potatoes, corn or cabbages, from a single big tract which they cultivated.

Every growing boy should have at least a brief summer season on the farm. Nothing of an industrial character will quite equal such an arrangement in the matter of personal development and insight into the problem of food production. Even a long day in the field is far better than any length of day of loafing about the resorts. Under right management practically all the wheat harvesting could be done by high school youths sent out from the city. They make better harvest hands than almost any other "green" class, as they are quick and willing.

Every high school should be a placing agency for city boys who wish to take a brief turn on the farm during the summer. Not only should they be placed by this agency, but they should be supervised while at work in the country. No course in the school proper could possibly prove more instructive and helpful than the rightly managed field work. Nothing would give more meaning and common sense application to the bookish lessons which city boys are forced to recite in the classroom.

# MR. FORD'S PAGE

THE inquiry needs to be urged, How much has this nation learned from its economic experiences of the past fifty years? The suggestion needs to be strongly put forth, that examination of our present business practices—*now*—might prove of unsuspected benefit to the nation.

All the aspects of a gold rush at the Klondike have been present in American business practices during recent years. There has been a great lack of that wider vision which sees business in its general relations; there has been lack even of a desire for that vision. We are still in the pot-hunter stage; business and industry have not risen in our minds as the meeting place of all law and science and service.

There are, of course, a few men who see these higher ranges of the common daily things we do, but perception is not very far advanced. Perhaps one of the great hindrances is the slowness of the people to comprehend the deep meanings of industry and commerce to their lives. They may not be blameworthy for what they do not know, but the fact remains that the principal support given to destructive forms of business comes from the people.

Those who analyze the danger-spots in today's conditions know definitely that it is not the great aggregations of capital but the great aggregations of gullible people that are promoting and supporting the practices which are threatening to drain the sap from our prosperous tree of economic life. The gold rush habit is irresistible among the people. They are the perennial, and apparently willing, victims of every fallacy that promises much for little.

But the tendency to lay the blame must be greatly tempered by the duty of laying the responsibility. This "something for nothing" philosophy has been received by the people from the older philosophy of business. This being true, it remains the responsibility of the business community to do all that it can to retract this wrong impression given, and lead the people into truer views of economic life.

In doing so the business community will be pricked by a sharp sense of its own shortcomings. Insofar as this weakness and delusion of the people is used to support temporary selfish onslaughts upon the general prosperity, insofar does it participate in the unspeakable crime of deliberately destroying the people's means of life.

*WE need more philosophers in prosperity. The world does not go far on the philosophy born of adversity. If we did more thinking in the time of our national prosperity, we should have to do less mournful wondering in the time of national depression. For the abundance of the latter usually results from lack of the former. It is the exercise of care while we are driving, not the exercise of remorse after an accident, that makes for long and prosperous journeys. Now is the time for American industry and commerce to examine its bearings and its direction. The time to inspect the ship is before trouble develops.*

Business itself has been ruled these recent years by the salesman's philosophy, which is at best a partial and lopsided one. It has even proved to be dangerous to established prosperity because it exploits an incidental factor at the expense of the whole. Business has allowed itself to be remolded, reshaped and swung aside by the recently enthroned philosophy of "pep" which has made the salesman, his methods and his point of view, the high priest of business practice.

Any factor let to run wild, or permitted to "sell" itself as the main pillar of industry, is likely to prove a serious detriment, because in the excessive zeal with which it pursues its own special interest it cannot escape the setting up of false relations and the setting in motion of extremely dangerous tendencies. The salesman's philosophy is written all over American business practices at the present moment and constitutes one of our most serious points of danger.

Salesmanship, when it has developed every curious scheme to get goods into everybody's hands, comes to an end. That is its judgment. Right courses do not come to an end, they expand into ever broader fields. Business has been led down a blind alley, and must now retrace its steps to the main highway whose watchword is Service—Service of which salesmanship is but a small and, in some instances, an easily dispensable part. In any case, salesmanship can never safely be considered more than a part of Service, and Service in its best sense will dwarf the importance of salesman's philosophy so much that in comparison with its present importance it will seem to have disappeared. Business that exists merely to keep a sales force going at what that force wants to do, and in the way it wants to do it, may have a merry time for a period, but it comes to a speedy end or a sudden, total change.

American business needs to analyze these factors and take reckonings of its course. When the damage is completed, an examination is not so fruitful. Let American business men begin to consider their business practices while these practices can be examined in motion. Philosophy in adversity is proverbial, but let us become philosophers in prosperity and avoid the necessity of the other sort.

It is the part of wisdom to inspect the ship when inspection can be made thorough. Emergencies test policies, but seldom generate them.

### *The "Hearings"*

THE "hearings" were rather unnecessary to begin with, but since the "wets" would have them they were granted, and the outcome was precisely that expected. The total result was an exhibition of gross-mindedness against public-spirited decency, and the more observant "wets" must have become aware, long before the hearings were done, that their psychology was as wrong as that of the German General Staff. Even General Lincoln C. Andrews' much heralded "cry for beer" failed utterly. It merely led to the comment: "What can be expected from a man who talks so much about what he is *going to do?*" That was the occasion of the first public misgiving with reference to General Andrews. Too much promise. Too much palaver acceptable to impressionable "drys." And then, biff! the medicinal beer permit which very few of the states will permit regardless of what General Andrews says. That was a dud. Duly the "wet" press reverberated with the great news that medicinal beer had been permitted. We were invited to behold this first significant crack in the hull of the Constitution. And then the blank silence of public indifference. It was so much of a dud that even the "drys" did not protest. And the "wets" were unable to keep up their cry of exultation beyond the second day. Then at the hearings came General Andrews' great word of comfort to the "wets," his "cry for beer," as the "wet" press described it. But again it fell on silence. Why? The people instinctively know that it is not important. It doesn't mean anything. The hearings, with all their attendant circumstances, have simply certified the American people that the anti-Constitution hue and cry had nothing behind it. The expected revolt did not materialize. The forces of "personal liberty" did not rise. An oppressed people did not seize the opportunity for deliverance.

It looks as if there is nothing left except for General Andrews to enforce the law, or get out.

### *Canada and Tariff*

DOES it not occur to Canadians that American manufacturers who are proprietors of Canadian plants have a very natural reason for wishing Canada to retain its tariff wall? That reason is, of course, that the tariff permits them to mulct Canadian buyers of higher prices than will be possible now. Canadians will now get their goods cheaper, which means increased purchasing power. The argument that the tariff is necessary to upbuild Canadian industry may be answered by the facts: where is the industry it has upbuilt? The strongest industries in Canada are those that have proceeded upon the theory of the best service at the lowest cost—that is, those that have ignored the tariff—and these are not at all affected by tariff reduction today. Political-business is no business at all. Tariff-sustained industry is government paternalism of a dangerous sort.

### *The New Sphere of Science*

THIS is a technical age. We can no longer depend on opinions or generalities and live. We must deal with facts.

Man cannot break laws; laws break him. The laws of this world were set down by the Creator before man began to live. All of these laws work, in spite of Congresses or of Senatorial dignity. They do not recognize social status nor financial position. If a weight is dropped, it falls, and where it lands the energy of its fall is and must be expended. There is neither hocus-pocus, nor habeas corpus, nor *pax vobiscum* that will stop that law or turn it aside.

Man's full labor for happiness is therefore in the discovery of those laws so that knowing he may not transgress them to his own harm, and may save his fellows from like punishment.

In this technical age, we are approaching a time when we must have a technical government. Politicians and small-town lawyers cannot translate science into everyday life for the benefit of their constituents, nor discuss with other than perfunctory oratory matters requiring knowledge of fact. Washington already is full of men of science serving our nation for a pittance, and under the dominance of the old-time politician. It is time they were taken from their offices in the Department of What Not, and moved to Capitol Hill with authority to act.

### *Peace by the Air Line*

AGREEMENT between England, France and Germany on matters of aviation is announced, and is of prime importance; for it is highly possible, indeed probable, that the airplane may be the harbinger of a new and lasting peace.

To the airplane there are no boundaries. The air has neither limitations nor landmarks, it cannot be staked out, nor can it be contaminated by national hatreds. Nations can pass laws regarding the air, but it is difficult to

enforce them. There was a law, promulgated by the Inter-Allied Commission, prohibiting ships of foreign nations from flying over German territory. Ships did, nevertheless, and when they were forced to land they were seized by the Germans. Now the three nations have gathered around a council table, and have at last agreed to something.

With aviation and radio, Europe is rapidly being forced to an international language. Peace comes with understanding; understanding comes with contact and acquaintance; and these are made possible by communication. As transportation is bettered, understanding increases. Misunderstandings are wiped out.

### *Plant by the Moon*

GRANDAD refused to plant potatoes until the moon was just right. Said they wouldn't "do well." Refused to listen to the modern view that it was all superstition.

Now science comes to the fore with the announcement that grandad was right. It seems that scientists now understand the nature of moonlight in connection with plant growth and are able to duplicate in the laboratory the effects of moonlight. Moonlight is reflected sunlight but differs from sunlight in that it is polarized light, that is, light waves which vibrate in one direction, whereas ordinary light waves vibrate in all directions. It has been found that certain plant growth is increased by polarized light.

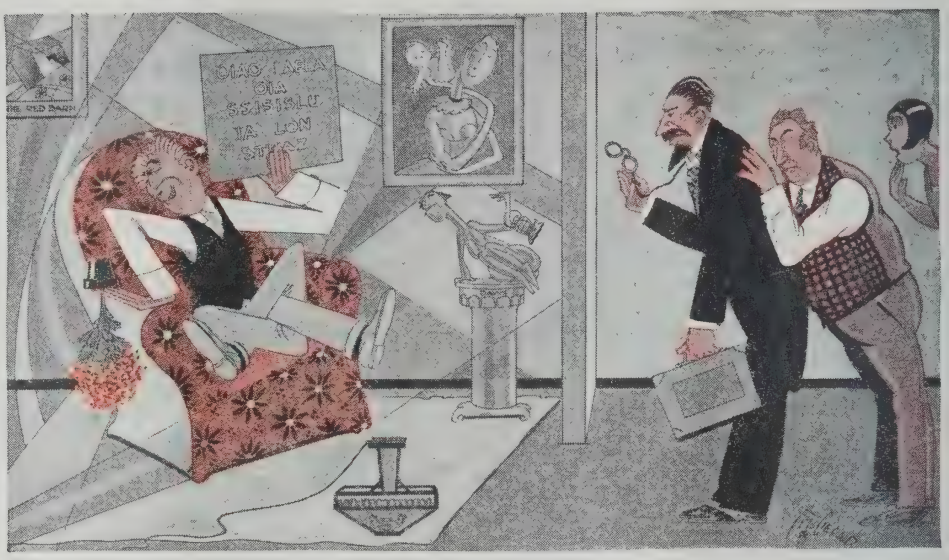
So grandad was justified in merely getting the ground ready for planting and then going fishing until the moon came his way in the proper quarter. In ancient times, when human life depended largely on the success or failure of crops, much attention was given to the time it was planted and comparisons made. The originators of the moon-phase idea knew by experience that in certain quarters of the moon they were sure of a bumper crop. They knew the effect but not the cause. Even the early Scripture speaks of "the precious things brought forth by the sun, and the precious things put forth by the moon." Biblical commentators have not known how to deal with the passage. Along comes science, and both Scripture and grandad can say, "I told you so."

### *The Decline of the Mawkish*

THE most remarkable thing about the Holaday Bill for the deportation of alien criminals is that such a measure was not passed years ago. That this nation is a refuge for the weak, the oppressed and the incapable has long been a popular theme with the sentimentalists. That it should also be a sanctuary for the criminals of the world seems likewise to have their complete support. In the face of the rising flood of crime in America, these rapturous emotionalists have the hardihood to oppose the Holaday act as "unjust harshness" to the alien!

To expel foreign gunmen from our shores is of course unjust. It is outrageous that we should refuse to coddle these convicts to our breast. So say the sentimentalists. "An immigrant who sheltered his own smuggled brother would be liable to this penalty," bemoans one New York newspaper. Surely the law should wink at crime, especially when perpetrated by aliens in the name of kinship!

Maudlin spellbinders of specious sentiment are losing caste in this country. Common sense is beginning to dictate our policy on immigration. And common sense is growing weary of the pretense of harboring the oppressed of the earth, when it is really the most dangerous oppressors that we are harboring.



### *It Is Not the Cost*

NEWSPAPERS favorable to the Administration are complaining about the cost of investigations into political wrong-doing. Putting aside the fact that it is not an attitude which the Administration can itself gracefully take, there is something to be said about the other fact that investigations make little or no difference. If all the colossal wrong-doing of American officials during the last war and during the Harding Administration was to be examined and exposed, it would be the work of one or two generations; both prosecutors and culprits would be moldering in the grave before the job was fairly begun. And as to the public, it would be weary long before any question had been finally determined. That is the discouraging thing about investigations. They would be worth all they cost if they led to such a wall of public sentiment that repetition of the crime would be impossible in future. But apparently that desirable end is to be attained another way.

### *About Face!*

ENGLAND has at last come to understand that it is not only labor that has been subsisting on a dole, but industry too. The Lloyd-Georgian philosophy of the hand-out has spread its poison throughout English activity. As there is no source of revenue but the people, this is a case of the cow trying to live upon her own milk—and it cannot be done. England is sometimes slow to see the fact, but does not evade it once seen. But surely never in her history has she been confronted with problems requiring such complete abandonment of adopted policy as she now is. Her course with regard to present problems will be of as momentous consequence to her as was the war.

# And, Behold, Humbug Is King

You and I, hearing one near to us declaiming "expressionist poetry" in the Blumner fashion, would certainly consider it a case of dementia and call in a specialist.

## Literary Quackery Has Now a Vogue Created by the Patronage of Chameleonic Individuals Who Eagerly Swallow All Luridly Colored Concoctions

By CHARLES J. FINGER

IF THE *Spectra* hoax proved the emptiness of one faddist movement, if it showed how any incredible inanity or any preposterous notion could find followers among the weak-minded who are everlastingly on the lookout for any new kind of mental dissipation, it did not check faddist activities in any marked degree. Perhaps nothing could do that, except some miracle such as that described by Wells in one of his stories, a miracle whereby all men become imbued with a frank honesty.

Year after year fad has followed fad, each to have a brief day, each to have its crop of followers. Given a literary eccentricity in Europe, given some fraud or fanatic, given some one on the border line between sanity and insanity, given a rascal sharp and cunning and plausible with a line of talk about breaking up academic limitations—given any of these, and some for whom notoriety is the very breath of life will leap to the rôle of protagonist this side of the Atlantic and straightway elaborate theories.

Chameleonic individuals whose aim is to appear up to date are alert to appropriate any idea whatsoever, and, slightly transforming it, give it the stamp of their own individuality. With their new toy they are welcomed in "cultivated" circles. Out of the window goes the old and tried lamp, and the glittering new thing takes its place. Literary societies and reading circles, too ignorant or idle to observe and compare, discuss the novelty with great gravity. Young people of perverted mind and no literary background proclaim their adherence. Odd and out-of-the-way journals seize upon the fad, and, behold, humbug is king.

So have risen, to fall, movements Realistic, Romantic, Didactic, Sexualistic, Symbolistic, Esthetic, Decadent, Mystic, Futuristic.

Meanwhile, the common man, who in the long run foots the bill and so decides the issue, goes on his way. He is a little blinded at times because of the wind-whirled sands of disputation, but on the whole he continues to go forward in a certain direction enjoying, in utter defiance of what he is told to enjoy, the old things, or the new things with world-old meaning. In the main he is after the sane things, the understandable things, the interesting things. Touching the ultra-modern he finds queer things by men of erratic mind. And stepping from his orderly business world into the world literary he seems to be moving into topsy-turvy land where are offered haphazard experiments and where few things are complete or comprehensive.

So he wonders whether there is not some polaris by which a charted course can be laid. He knows what he likes and he knows what sustains him intellectually just as he knows what sustains him physically. Yet he is told that he is to be suspicious of the things he likes. To base preferences upon individual taste, he is told, is hedonism, and the word has a sinister sound.

Intermittently he analyzes roughly and finds that his preferences run to that which has literary finish. He likes Barrie, for instance, and much of Kipling; and Hawthorne's *Scarlet Letter*. Descriptions and portrayals, too, he enjoys, especially when the words used are the right and characteristic words. In that connection he remembers some of Fielding, much of Twain, a good deal of Stevenson, much of Cooper, and of London, and of Stephen Crane about whose work so little seems to be said nowadays.

Still, there are, in magazines and papers, writers who affect superiority talking about new values and the passing of the old; and there is Upton Sinclair writing about vicious and perverted standards, damning with faint praise anything non-Marxian. But, trying the new and the praised, or some of it, he revolts. So much does not seem to function, as it were. So often there seems to be manifest a kind of savage indifference to sense or order. So often instead of beauty there is the wild riotousness of a scrap dealer's yard.

There seems to be no consensus of opinion. Mencken and Sherman stand opposed and their followers are split into sects and parties, and theories are dinned daily from a thousand magazines, papers, books, platforms. There are bodies here and bodies there like brigades marching about aimlessly without officers. Or it is all like a sea crowded with yelling, vociferating pilots

in rudderless crafts, each advocating a different course. Our man then hears all those frantic appeals and wonders the more if there is not some guiding star, some polaris.

Searching for some such guide, let us look into some of the newest of new movements. Consider first the latest blast from the trumpet of a pioneer who would break up academic limitations of subject and fashion of treatment. The expression has the old familiar ring; the movement is absolutism; the exponent is Rudolph Blümner, a former actor in Germany who suddenly became filled with divine afflatus. His vehicle, in his own words, is "expressionist poetry—the conceptually illogical but esthetically logical combination of words which renders possible a lingual-melodic rhythmatization leading to a unity."

That verbiage is not clear as crystal by any means. It may be the rodomontade of a fraud, or it may be evidence of the exalted nervous tension of a man on the verge of insanity. But the proof of the pudding is in the eating, so I copy part of one of his poems. I have not dragged it from any explanatory context, and it must be remembered that the words have no meaning and are not part of any known language. The thing is "to be read musically," he tells us, with "no desire to convey meaning to the hearer":

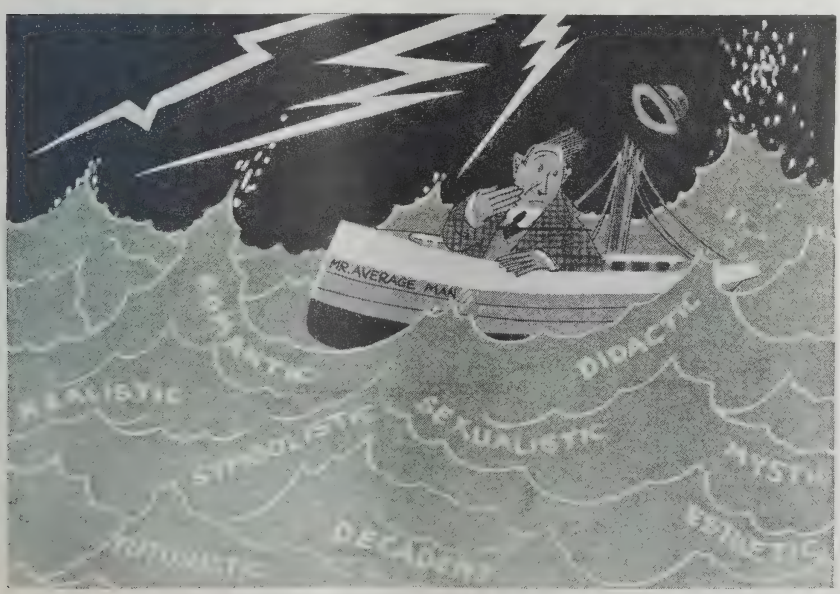
Oiao laela oia ssisislu
Enaudio tress sudio mischnumi
Ia lon stuaz
Brorr schjayy

and so on. With that gibberish and blabber the addle-pated mountebank declares that he has given "sound an ethereal freedom, liberated it from the earthern vestiture of elements too material and too human." His American introducer, H. G. Schaffaeur, in his book *The New Vision of the German Arts* (B. Huebsch, 1924), says that Blümner's theory is "highly subjective, but it is also rooted in instinct and nature, and so cannot be dismissed as mere nonsense." But you and I and hundreds more who turn away when meretricious pretense seems to call our attention will have no hesitation in dismissing it as pernicious nonsense because it is without sense, and, hearing one near to us declaiming in the Blümner fashion, a bookkeeper in the office or a man in the machine shop or one of our own children would certainly consider it a case of dementia and call in a specialist.

Stepping from his orderly business world into the world literary he seems to be moving into topsy-turvy land.

While the Absolute poem has not yet invaded this country, its near cousin the Expressionist poem is with us. "I will not," runs the Expressionist creed, "let the outer world impinge upon me and use me as a recording or interpreting instrument. I am the recorder, the interpreter of my own inner feelings, thoughts, moods, emotions; and these I express directly, abstractly, free of the thralldom of the object, unburdened by the material of the thing, or the image of the thing.'

There you have the ring of the unbalanced mind, the mind with no sense of proportion. But on that aspect it is unnecessary to dwell. We pass, instead, to the outcome of this inner-consciousness, and here it is—the poem unrestricted, unconfined, no sail, no rudder, so to speak. I give the complete poem. The poet's name is Kurt Liebmann.



Thy hair fluffs smiles
breath velvet
Thou
Kissest at longings silver-thread
claw stark plaint
to waving light
and
curling
circling
bluest
sigh.

"But," says the literary rebel of the advanced school, "you must concede everything; you must free your mind to grasp the hidden beauty." And certainly he who concedes everything, that is he who yields to hypnosis, may come to believe anything and everything, and therefore nothing. He may believe that the earth is flat, that parallel lines meet, that snow is sauerkraut. But, for the sake of experiment, try to let your mind be a *tabla rasa* for a moment and see what you make of a poem by E. E. Cummings. I choose him because he is an American, because he appears in the *Dial*, because he is bracketed with Malcolm Cowley, William Carlos Williams, Gorham B. Munson, and Waldo Frank as among the elect. I copy the poem from the issue of the magazine *Secession*, July, 1922.

life hurl my yes, crumbles hand(ful
released concarefetti) every flitter
ings where
mill)ions of aflickf)litter ing bright
million of S hurl edindogge; ing
whom areEyes shy-dodge is bright
cruMbshandful, quick-hurl edin-
who
is flittercrumbs, fluttercrimbs, and
float falling; allwhere;

and so on. I have quoted enough to show the significance, or otherwise, of the thing. Unless I am greatly mistaken, any business man finding that on his auditor's desk and in his auditor's handwriting would consider it, if he considered it at all, as marking a case for the alienist. I imagine him standing amazed, asking himself whether it signified some lesion of the brain center, or whether it was a piece of sheer impudence, or whether it was a hoax.

But turning to another issue of the same magazine, *Secession*, he would find an explanatory article by Waldo Frank, and he would read that the *Secession* group is composed of inspired intellects which have "glimpsed certain truths still largely alien from human experience." Why those truths should

The modern literary sea.

take the form of uncouth nonsense is not clear, but we do learn that the new school has evolved "the harsh and guttural beauty of new words," and new words, Frank tells us, are necessary for the new experience of man. Searching further, our hard-headed business man would discover that the paramount aim was emotional appeal. He would further find that the newest poetry "frankly experiments in the direction of what will be new and better adapted to self-expression than anything that has gone before."

So far so good. Our imaginary efficient workaday man bears all that in mind. Then he ponders awhile. He remembers having read, or heard, or thought, certainly agreed with the idea that the artist in literature is known by his verity of insight as well as by the way in which he reflects his impressions of nature and of life, of the problems of men; and it seems to him that the language of the day, a slowly changing language it is true, has always been an adequate vehicle. As to emotional appeal, he has certainly read things that stirred him. But when it comes to talking about the language of the future, it seems to him to be unnecessary to spend time over that in the present. Then like a flash comes another idea. He remembers certain poems. They fascinated in after contemplation. But that strange, chaotic stuff did nothing of the kind. Without substance, it vanished like a bad dream.

*Skimming the Cream of the Cream*

The test of memory then is one thing. And the average man remembers because of several things: for one because of the interesting or beautiful images; for another because the poet shows himself to possess vigor, descriptive powers, fecundity; because of felicity of phrase; because of the presence of wit and point and polish; because of simplicity and beauty; because of elemental sympathy; because of clear certainty and warmth; because of—well, skimming the cream of the cream, for the average man, in any poem worthy of the name, the music and the images harmonize with the thought. Or put it this way: for the average intelligent man a poem is the flowering into words of a mood, an idea, an experience.

*The Day When the Cat Was Buried*

Let us place two modern poems side by side. First, one by William Carlos Williams, a modern of moderns. I take his "Complete Destruction" from his book *Sour Grapes*, published by the Four Seas Company, Boston. Here it is in its entirety:

It was an icy day,
We buried the cat,
then took the box
and set fire to it
in the back yard.
Those fleas that escaped
earth and fire
died by the cold.

Now take another, this time by Edwin Arlington Robinson.

RICHARD CORY

Whenever Richard Cory went down town,
We people on the pavement looked at him;
He was a gentleman from sole to crown,
Clean favored and imperially slim.
And he was always quietly arrayed,
And he was always human when he talked;
But still he fluttered pulses when he said,
"Good morning," and he glittered when he walked.
And he was rich—yes, richer than a king,
And admirably schooled in every grace;
In fine, we thought that he was everything
To make us wish that we were in his place.
So on we worked, and waited for the light,
And went without the meat, and cursed the bread;
And Richard Cory, one calm summer night,
Went home and put a bullet through his head.

Without any of that vague respect for the mysterious non-understandable which influenced editors to accept the *Spectra* stuff, which of the two poems of incident, as I choose to call them, holds the emotion appeal? In which is there obvious straining after effect? In which is there stiffness? In which affectation? Which seems silly, or extravagant, or the effect of some aberration? The answer is evident.

Once more, in which of these that follow do you find ecstacy, a quickening of the pulse, a vision? First, I quote from a book of mood poems published in Chicago, called *The Magpie's Shadow*, written by Yvor Winters. The poet is striving after a certain Chinese naïveté. The poems, complete, follow in their cryptic brevity:

FIELDS

I did not pick
a flower.

and

WINTER ECHO

Thin air! My mind is gone.

Now consider this, by A. E. Housman. It is quite as matter-of-fact as the Winters' contribution, but which possesses the charm? Which poet strikes you as pregnant of imaginative power? Here is the Housman

EIGHT O'CLOCK

He stood, and heard the steeple
Sprinkle the quarters on the morning town.
One, two, three, four, to market place and people
It tossed them down.
Strapped, noosed, nighing his hour.
He stood and counted them and cursed his luck;
And then the clock collected in the tower
Its strength and struck.

Comment is needless. Both Winters and Housman are at work on the same idea, that of creating a poem which when read will make the thought continue. But the common man feels and knows that Housman wins easily. He reads of the hapless fellow on the gallows and his accompanying mental state is one of extraordinary tension; the entire scene impresses itself to the minutest detail in such way that the intensity becomes painful. That is art. But what of tension do you get in

*Fear of Lifeless Literature Is Baseless*

Thin air. My mind is gone.

It might mean anything or nothing. To the common man it means something very much akin to the yellow stockings and crisscross garters of Malvolio.

New forms, not imitative, have their place today as they had their place when the Elizabethan lyrists sang of a world unknown to the Chaucerians. The sane man no more rebels against them than he rebels against airplanes or automobiles or radio instruments. For that sane man knows that there is no resting place in the camps of the hidebound classists any more than in the camp of the lawless rebels who would rip open the bud to obtain the full flower. Between the two forces is safety.

If that is doubted, take a sweeping survey of the field of American poetry. At once it must be plain to any open-eyed man that the expressed fear of a lifeless literature is baseless. With what astonishment would Edward Rowland Sill regard Sandburg's *Chicago Poems?* What would the Autocrat of the Breakfast Table have to say of Masters the cynic? Would Whittier read or understand John Gould Fletcher? Doubtless James Russell Lowell with that true comprehension of the philosophy of democracy of his would enjoy Ezra Pound's *Ballad of the Goodly Fere*, but what would be made of the same poet's *Three Cantos?* Emerson might join hands with George Santayana, but James Oppenheim would sorely puzzle him. Certainly Washington Irving would consider Robert Frost as a daring innovator. Viewed in retrospect we have marched far. But reach a little further back. Mark the vast gulf that separates the American moderns from Rossetti, and Clough, and Tennyson, and Mrs. Browning—a gulf far deeper and wider than that which separates those named from Milton, or Marlowe, or Raleigh, or Sir Philip Sidney, or George Herbert.

*Gulf Divides Moderns From Victorians*

The common man is not so absurd as to place his trust in a machine all brake, neither in one all motor. He knows that both are essential to safe and sane progress

# Australia—A White Man's Country

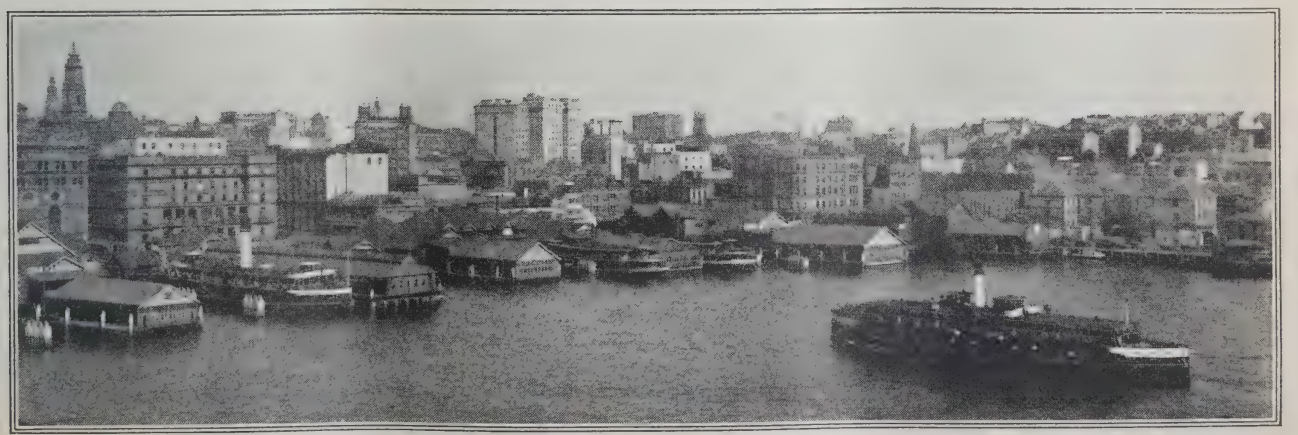
## Island Continent Believes Its Prosperity Lies in the Path of the Anglo-Saxon

By WILLIAM LEE CALNON

WITH practically the same area as the United States, and three-fourths the size of Europe, the continent of Australia stretches from the tropics deep into the south temperate zone. From east to west it reaches almost the distance from New York to San Francisco. It is an island continent fraught with wondrous possibilities that as yet scarcely have been comprehended.

The population of Australia is at present about six millions. The country could support, and at some future date probably will support, a population greater than the present 120,000,000 Americans. Vast territories inland are as yet untouched, the two major cities of Sydney and Melbourne claiming one-third of all the population now resident in Australia. Each of these cities has a million population, each has a splendid harbor, and each transacts a tremendous business both at home and abroad. Rivalry between the two is intense.

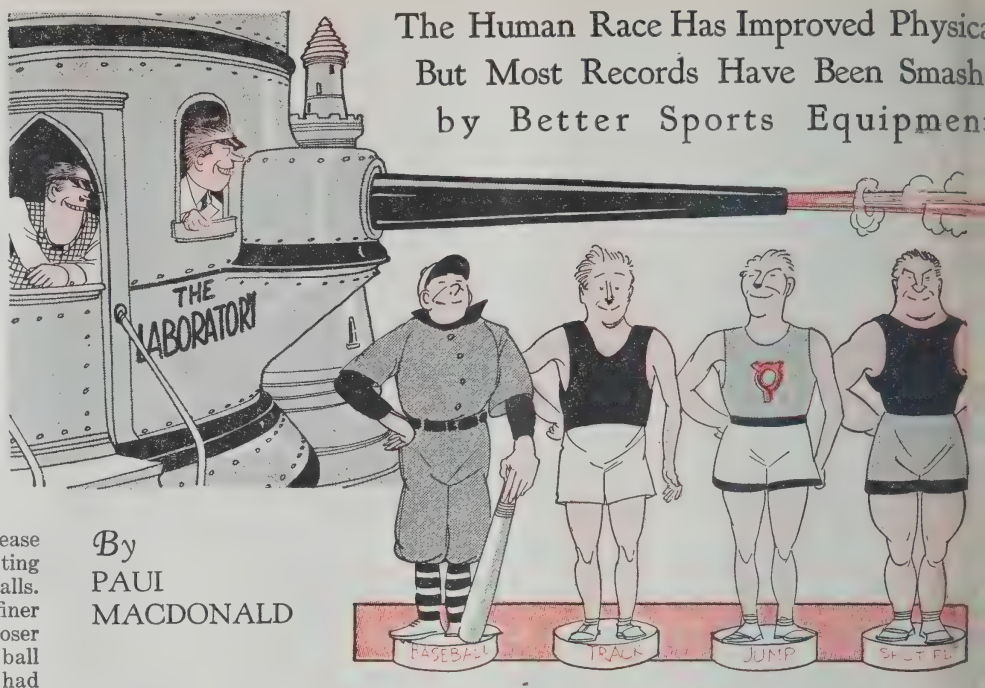
The commonwealth of Australia, part of the British Empire, includes the large island of Tasmania lying to the south and comprising a state in itself. On the main continent there are five states and one territory. The states are Queensland, New South Wales, Victoria, South Australia and West Australia. The northern territory includes a great section of country about which very little is known. There also are stretches of hundreds of miles in extent in West Australia that are unknown to white men.



Settlers in Australia clearing away trees on home site.

Nature has favored Australia in many ways. Its climate is perhaps the finest in the world for a country of such great extent. Winter has no rigors anywhere, there being but one section of mountainous country, ninety-five square miles in area, where snow prevails from June to November, the Australian winter season. This is in the Alpine district of Kosciusko, only twelve hours' journey from Sydney by train. Winter sports of skiing, tobogganing, snowshoeing and ice skating, unique in a land of sunshine and genial warmth, claim thousands of devotees every year.

With its northern coast and peninsulas in the tropics and its south coast in a mild temperate zone, Australia has a range of natural products that covers everything that can be produced anywhere in the world. While it has its mountain ranges, its deserts and its rocky ridges, it has for the most part huge plains and great valleys of remarkable fertility and rich soil. Sheep, cattle and all kinds of stock can graze in the open the year round, and agricultural production, huge though it is today, is only a small fraction of what it will become when the country is more thickly settled and the advantages its soil offer are more widely used.



Australia is rapidly forging to the front as a wheat country. Just a year ago it was marketing the greatest wheat crop in its history, and at a time when wheat prices were the highest in many years. It was also experiencing its third straight year of enormous wool production, during all of which time wool prices have been at a high level. Wool always has been Australia's chief product, from a world standpoint. It not only leads the world in quantity of wool produced, but also grows the best quality. It exported more than seven hundred million pounds of wool in 1923, the last year for which official figures are available now.

Possessed of enormous mineral wealth, Australia has only touched its great resources of metal and precious stones up to the present. New discoveries are being made right along with continuous (Concluded on page 31)

Circular quay, in the heart of Sydney, where all ocean passenger ships and local ferries land.

## The Human Race Has Improved Physica But Most Records Have Been Smash by Better Sports Equipmen

By PAUI MACDONALD

# THE LABORATORIE

WHEN an epidemic of home runs startled baseball several years ago, club owners explained that the thing was due to bad pitching.

This explanation was hardly satisfactory. You could not reasonably assume that all pitchers suddenly lost their stuff. Also, you could not reasonably assume that players who were always tabulated as weak batsmen suddenly learned to hit. Men that had for seasons established themselves as able pitchers were being battered from the box, while the list of .300 batsmen in the two major leagues suddenly increased to more than 100, about four times what it had been through a number of seasons.

After a few months it was established that the free hitting in the big leagues was not caused by a decrease in pitching ability nor an increase in batting ability, but was due to a change in baseballs. More rubber in the core of the ball, finer twine wrapped more tightly, and a closer fitting cover of finer leather, created a ball that traveled much faster than any ball had previously traveled. The inflation of the batting averages was not accomplished by a newly developed skill on the ball fields, but was brought about in the laboratories of the baseball manufacturers.

The laboratories made Babe Ruth baseball's greatest drawing card of all time. Of course, Ruth contributed a certain share. Ruth swung on a ball harder than any batter of his day, but Ruth could never have piled up his amazing total of 59 home runs in the course of one season's play, if he had to bat against the ball used ten years ago when home runs were as scarce as shutout victories after 1920.

*New Ball Begets Home Runs*

Baseball has produced other mighty sluggers. Adrian C. Anson, Ed Delahanty, Napoleon Lajoie, Honus Wagner and Sam Crawford were all powerful swingers at the plate. Under the same conditions any one of them might have hit more than 59 home runs in a single season if the pitchers used the same kind of ball that Ruth batted against while setting his mark. Old-timers, who tested the new ball, expressed belief that the old sluggers would have done at least as well as Ruth. Men who are still actively engaged in baseball, and who were identified with the game when Crawford was in his prime, say that Crawford would have hit at least 75 home runs in a single season, and probably more. Their explanation is that Crawford was a long fly ball hitter, a player of the order of Ruth and, if anything, more so. Outfielders always played within a few feet of the fence for Crawford, and Crawford generally hit to within a few feet of the fence, if he did not actually hit the fence. The new ball had from 30 to 50 feet more "wing" than the ball used in Crawford's day, meaning that the new ball, hit with the same force applied to the old ball, would travel from 30 to 50 feet farther. This increase in carrying distance would have taken most of Crawford's drives over the fences.

Baseball has, therefore, not developed any new batting marvels. There are no better batsmen in the game today, on the whole, than there were fifteen and twenty years ago. The laboratory has made them appear as much better batsmen in the record books, and this same laboratory made the pitchers of recent years seem inferior to the pitchers of previous eras.

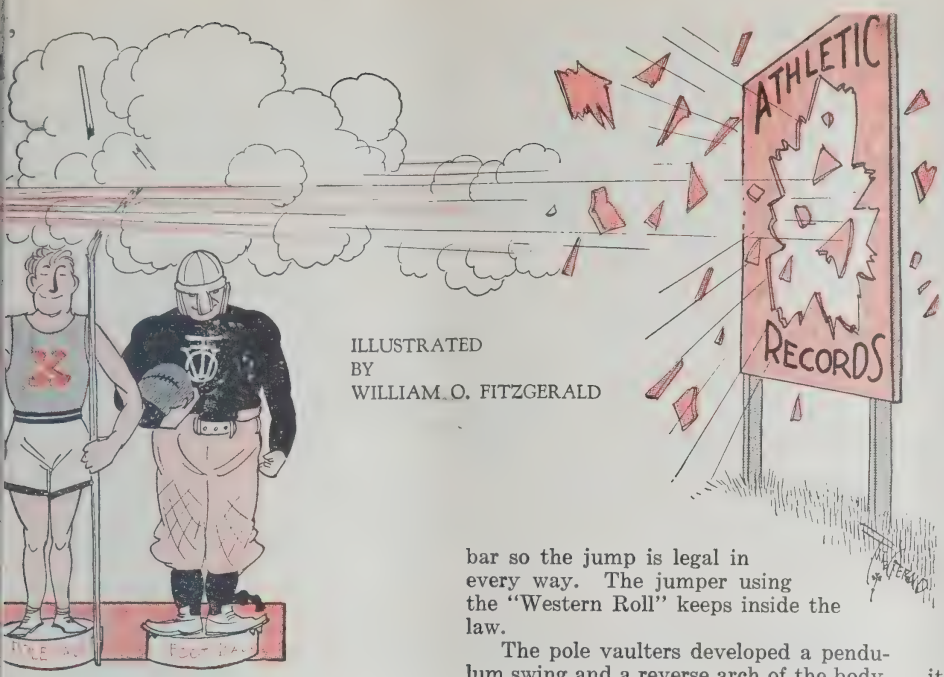
As with baseball, so with other sports. The frequent smashing of records has left us to the conclusion that the race is growing bigger, better, stronger, keener, quicker, faster, and more supple, but on analysis the laboratory, and science otherwise applied, has been responsible for most of the record smashing.

At the Western Conference meet in Chicago late last spring, De Hart Hubbard, the flying negro that carried the colors of the University of Michigan, broad-jumped 25 feet 10⅞ inches, the longest jump ever made by a human being as far as the records show.

The best previous jump in college competition was by Ned Gourdin, also a member of the Ethiopian race. Gourdin, representing Harvard University, jumped 25 feet 3 inches in 1921. Bob Legendre, a former Georgetown athlete, broke Gourdin's mark at the Olympic Games in Paris in 1924. Legendre jumped 25 feet 5½ inches in the pentathlon competition. This mark stood until last June when Hubbard cracked it by more than 5 inches.

Hubbard is a better broad jumper than either Gourdin or Legendre. Hubbard, jumping in sanctioned meets, bettered 25 feet more than a dozen times, and he jumped farther than 25 feet on more than two dozen occasions in practice. But, is Hubbard a better jumper than Peter O'Connor, the remarkable Irishman that became the world's champion broad jumper in 1901 with a leap of 24 feet 11¾ inches?

O'Connor was one of the most unusual athletes of all time. This Celt stood more than six feet in height, weighed less than 150 pounds, and had abnormally long legs. While he never quite reached 25 feet in an official jump, he beat 25 feet a number of times in unofficial meets. I heard from one of his relatives a few weeks ago that one afternoon he beat 26 feet.



O'Connor's jump of 24 feet 11¾ inches is a better jump than Hubbard's leap of 25 feet 10⅞ inches, when certain matters are considered. O'Connor jumped from a grass take-off and he jumped straightaway. Hubbard (and Gourdin, Legendre and the other present-day broad jumpers for that matter) jumped from a finely prepared cinder take-off, and did not jump straightaway.

*Making Running Step While in the Air*

When O'Connor leaped 24 feet 11¾ inches it was apparent that the limit jump from sheer spring had been recorded. Since O'Connor's record stood through 20 years, the assertion seems plausible. It was therefore evident that if O'Connor's record was to be broken something other than sheer spring must be employed, and the broad jumpers started experimenting on some body movement in mid-air that would add extra inches to their jumps.

Athletic authorities credit Gourdin and Hubbard with inventing the trick that broke O'Connor's mark. They introduced a running step while in the air, and this movement brought both of them over the 25-foot mark.

All the crack broad jumpers use this

# S DID IT

step. Motion pictures made of Legendre at the Colombes Stadium, where the Olympic Games were held, show the American leaning his body backward just previous to taking the step in mid-air, and follow this movement by a whip-up from the waist in the midst of the mid-air leg action.

O'Connor knew nothing about this trick. He sailed through the air with only one motion. The step that the new champions use and the cinder take-offs from which they leap are said to have added two feet to the jump. Add two feet to O'Connor's best jump and you have a leap just one-quarter of an inch shy of 27 feet.

It was George Horine who introduced a new style for high jumpers. This trick is now known as the "Western Roll." When Horine developed and used it the European experts said it was illegal, but the international judges, after studying the jumps of Harold Osborne at the Olympic Games in Paris, decided the trick was really legal, and Osborne used it, winning the high jump and setting a new Olympic record for the event.

*High Jumpers Use the "Western Roll"*

The jumper, using the "Western Roll," takes off at an angle of 37 degrees from the line of the crossbar and gives the feet twice the momentum of the head. His body is parallel to the bar as he crosses it. When he reaches the height of the bar the left arm is dropped down, the under leg is bent at the knee and the upper leg is extended. The body gives a twist and this half-revolution brings the jumper face downward. Apparently he has rolled over the bar, in reality he has not. And since the head has been kept back and up during the evolution he has not dived over the bar so the jump is legal in every way. The jumper using the "Western Roll" keeps inside the law.

The pole vaulters developed a pendulum swing and a reverse arch of the body. This change, with perfection in timing, brought them close to 14 feet. Then the Europeans invented a bird-like flight, used after releasing the vaulting pole, that enabled them to beat the records of the Americans.

The greatest aid to record-making in the pole vault was the change in poles. Originally the pole was of ash or hickory. This proved impracticable. The wooden pole was too heavy for one thing, and too dangerous besides. The ash or hickory poles often broke, causing injury to the vaulters. A few deaths resulted when the broken shaft jammed into the body of the athlete.

Americans solved the problem by inventing a pole made from light bamboo stocks. While much lighter than ash or hickory the bamboo poles are more durable and stronger. They never break in two. By using adhesive tape over the handle of the pole, all danger is eliminated. The decrease in weight enabled athletes to top all previous records.

More than 40 feet was added to the javelin throw by a change in the javelins made by the Finns. The old javelins were made with ash shafts. The Finns tried a stiff-shafted javelin made of Finnish birch and discovered that it traveled much farther than a javelin with an ash shaft thrown by the same man in the same way.

When the hammer throw was added to the program of athletic events the hammer throwers employed a 12-pound sledge, the kind used in all blacksmith shops at that time. An American invented the "cannon ball" hammer, consisting of a spherical head to which is fastened piano wire and a handle shaped like a stirrup. This change more than doubled the distance of the hammer throw.

The Finns improved the discus, produced a new kind and by their knowledge of woodcraft were able to discover an implement that enabled them to shatter all previous discus records.

In the track events there has not been such a startling betterment of records, but those of the present day are still much better than the marks of 20 years ago. This does not mean that the present race of sprinters is faster than those of the past. Certain changes have been made in the style of running, but these are not nearly so marked as the changes in track construction. Laboratory experiments with dirt, clay, sand and cinders, have brought out numerous facts. Laboratory workers discovered combinations that would give more spring. The difference between a slow and a fast track is not necessarily the difference between a wet and a dry track, but can easily be a difference in composition of the track, meaning the surface and the underlying ground. There may have been faster sprinters twenty-five and fifty years ago than there are today, but they never ran over tracks nearly so fast as those we have now.

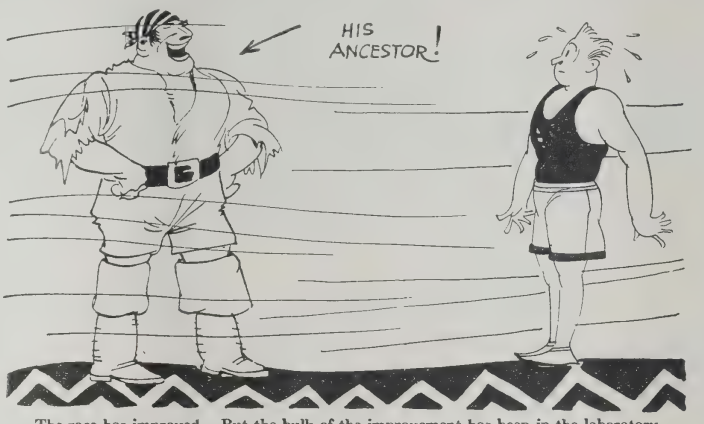
Equipment has something to do with it, also. I understand that a shoe is being perfected which wi'l bring about the nine-second man. No human being has ever traveled 100 yards in nine seconds flat to a watch. This new athletic shoe, of one piece and foot form, if as successful as predictions have it, will enable one or more of our crack sprinters to cover the century in nine flat, a performance that would be the greatest track sensation in history.

It is not possible to bring about any noticeable improvement in the technique of sprinters, at least no such changes have been made in the sprints as in other events. In the hurdle, for instance, the technique has been radically altered, like in the high jump, pole vault and broad jump. In the hurdle races the straight leg system and the trick of raising the back knee to bring the rear foot through quickly has cut seconds off the records. But in the sprints, no such changes are possible. The improvement must come in tracks and shoes.

*The Finns Improved the Shoe*

The Finns learned the importance of the shoe some years ago. They invented a wide shoe with slightly curved soles, and this style is said to have been as largely responsible for the success of their javelin and discus throwers as the changes they made in the discus and javelin.

Football is a much faster game today than it was twenty years ago. The game has changed, but not the race. The men that play football today are not better than the men that played twenty years ago, taking them on an average. Twenty years ago weight was essential. So was strength. The introduction of the forward pass and the gradual opening up of football demanded a type that had strength, speed and quickness. The latter two qualities were most essential. To make for speed and quickness, coaches discarded all the "harness" possible, and what protective garments football players



still wear have been so reduced in weight by experiments and developments in the laboratories of the sports goods manufacturers that today the player, carrying pounds less than the player of twenty years ago, appears to be much quicker, faster and more alert than the former stars of the gridiron.

In swimming, the last ten years have seen the most phenomenal smashing of records and succession of champions any sport has known. Among the men swimmers Duke Kahanamoku, Norman Ross and Johnny Weismuller have appeared in the order named, each in succession wrecking about every swimming record in sight. Women swimmers proved even more prolific in record making than the men and it was difficult to follow the dizzy pace of such swimmers as Ethelda Bleibtrey, Gertrude Ederle, Sibyl Bauer, Charlotte Boyle, Aileen Riggin, Helen Wainright, Agnes Geraghty and others in recent years. Here constant development in technique was responsible for the ever-increasing speed and it is safe to say that the best records in swimming are still to be made.

This development extends into harness and thoroughbred racing. Ask the breeders to explain the increase in speed and they will tell you that scientific breeding is responsible. "We are constantly producing better and faster horses," say the breeders, but are they?

To a certain extent breeding is responsible, but to a larger extent the laboratory is. Many remember the high-wheeled, heavy sulky, with the driver stretched high above the level of the horse's back. In the early days of the harness sport no horse covered a mile in as low as three minutes, and horsemen were dreaming of the day when a three-minute horse would appear. Today they are either breaking two minutes for the mile or coming close to it in Grand Circuit races.

Will the breeders kindly explain how Dan Patch, at the top of his form, covered a mile in 2:04¾, surely a startling performance, and then covered a mile in 1:55 flat? Dan Patch certainly did not improve nine and three-quarter seconds. Dan Patch was probably not a second faster the day he went a mile in 1:55 than the day he covered the stretch in 2:04¾. The difference was not in Dan Patch but in the sulky that Dan Patch pulled. On the day he negotiated the mile in 2:04¾ Dan Patch was hitched to a high-wheeled sulky and on the day that he did 1:55 Dan Patch was pulling a low, light sulky. The change knocked more than a minute off the mile mark of harness race records.

The race has improved. But the bulk of the improvement has been in the laboratory.

Many will remember the old sulky with its high wheels, heavy body and high seat, the driver sitting high and erect. Then started the improvements in the sulky. It was made lower. It was made lighter. The high wheels gave way to small wheels and then came pneumatic tires for these wheels. The axle was removed. The seat was built so low that the peak of the driver's cap came on a level with the line of the horse's back. No longer did the driver break the wind and retard the horse. Aluminum shoes were invented and various types of shoes to prevent the horse breaking its pace.

Then the track. It was discovered that faster time could be made on a hard track so they started constructing hard tracks with a soft top to prevent injury to the horse. Later they found out that a gentle undulation in the track permits much faster time than can be made on a level track. Came the undulation in tracks with particular attention to the turns.

The thoroughbreds have nothing to do with sulkies, but the changes made in track construction brought about more speed in thoroughbred racing and the creation of new records. The thoroughbreds were likewise benefited by the new aluminum shoes and the different types of shoe constructed to aid different kinds of horses and take care of all track conditions.

What helped the thoroughbred as much as anything was the change in the method of starting races. The barrier was invented, and running races were started by the sudden lift of a barrier. This shoots up when the starter presses an electric button. Horses are schooled to the barrier, and they start a few seconds faster than they did under the old system where it was difficult to get them away.

The human race has improved. That is true; but the bulk of the improvement has been in the laboratory in at least the majority of sports.

# Socialism With the Bark Stripped Off

(*Concluded from page 4*)

couple of generations; and such destruction is heartily to be desired for any race of such infamous character as to tolerate such a system." (*The Outlook*, March 20, 1909.)

Thus far I have spoken only of the attitude toward one particular form of wrong conduct. But it is the same toward all the others. A man who has got it into his head that all our rules about right and wrong are merely the outgrowth of a capitalistic system, which he declares is fundamentally wrong, necessarily has such a perverted view of property rights, and even of the value of human life, that he becomes one of the most dangerous persons I can conceive. With his perverted idea of the radical contrast between "capitalist morality" and "proletariat morality," we can readily understand that he will consider it for the good of the "cause" for him to do everything he possibly can to bring about a breakdown of the present system of "capitalist morality" regarding sexual matters, regarding private property, and regarding the sacredness of human life, and to insure the replacement of these views by others founded on his system of what he regards as for the best interests of his class. For this doctrine of the "class war" is another idea which is an integral part of his system.

The exploited wage slaves have nothing to lose but their chains, while they have a world to gain, to use the common cant phrases of these people; and the one thing they are all working for and longing for is that blessed social revolution which they declare is the next stage in the development of mankind. Nor need we expect them to be very choice in the methods they employ to bring about this long-hoped-for social revolution.

With this attitude of mind, Socialists will naturally say that everything which delays or impedes the coming of this social revolution is anti-ethical or immoral; while all lines of conduct which tend to promote this revolution are ethical and praiseworthy. True, we may expect some wrangling among themselves as to the best means of attaining their objective. The "left wing" or radicals want a method of "direct action," even though it involves a policy of red terror and no compromise; while the "moderate Socialists" want to go a little more slowly, so as to bring about the change less abruptly; they want to see an easier transition into their socialistic paradise.

Such a man as John Spargo, who has been very active in denouncing the methods of the Russian Soviet, admits that his objections to Bolshevism are based only on expediency, not on any basic moral principles. For he says:

> "If the class to which I belong could be set free from exploitation by violation of the laws made by the master class, by open rebellion, by seizing the property of the rich, by setting the torch to a few buildings, or by the summary execution of a few members of the possessing class, I hope that the courage to share in the work would be mine." (*Syndicalism*, p. 172; edition of 1913.)

Of course, all this is logical enough from the point of view of a man who can see nothing in morality except the formulated expression of the interests of one class of society as opposed to another class; but it is no better than the ethics of savages and bandits. And I wonder that the American people have so long and so patiently allowed these anti-social doctrines to be taught throughout the country, not only in the university classrooms, but even in the high school and in the common school.

Woe to the land which permits a generation to grow up with the present confused ideas about what is right and what is wrong in social and in individual conduct. Those who sow the wind must not be surprised if they have to reap the whirlwind.

# Chats with Office Callers

"Most of the eggs of Europe come from China," said ***An Educator from China*** as he displayed photographs of Chinese agricultural methods. "They are collected from hundreds of miles inland and all along the rivers, and packed for shipment, the yolks separated from the whites. The Chinese are held back by lack of machinery. Everything is done by hand. The threshing is done by flail. The best a man with a flail can do is one hundred pounds of wheat a day. The rice is planted by hand, sprouts being used instead of seed. The utmost a man can do with a stone mortar is to separate six bushels of rice a day from the husk. And yet the Chinese are natural-born mechanicians. It is marvelous the way they take to machinery. They respect machinery in a way that makes an engineer's heart glad. There are 20,000 automobiles in China manned, all of them, by Chinese chauffeurs. Land is higher in China than one would think. Near our place it is valued at $600 an acre. Though living in China costs about one-tenth what it does in the United States, prices of commodities are on the increase. When I first went there eggs were sold at a quarter of a cent apiece, or three cents a dozen. Now they cost a cent and a half each, or eighteen cents a dozen. And pork brings about the same price as in America. At the present rate of rice planting by hand, about one-tenth of the population is needed to put in that one crop. This means something, since the price of labor is going up. A rice planter will now cost the farmer about a dollar a day Mexican. China needs machinery, but I am not sure that we can use the big American agricultural machines in all parts. American machinery manufacturers should give some study to the needs of China, for it will soon be one of the world's great markets."

ɤ ɤ ɤ

"I am never surprised by any claim for animal intelligence," said ***A Dog Lover*** as he stretched comfortably on a veranda in the South, "because my companion for years was the most intelligent animal I ever knew. He was a police dog. He understood conversation and he divined motives. The latter seems a commoner gift in animals than does the former. My dog—I called him "Germany" because of his place of origin—understood conversation whether addressed to him or not, as long as it concerned the things of his world. Suppose we were talking here, as we are now, about anything that comes into our minds, interminably talking, hour after hour, about tariff, music, business, politics, religion, what not, and in the midst of the politics I should interject, in exactly the same tone of voice, a sentence—'I think I forgot to lock my car'—and then resume the conversation without a break—that dog, apparently asleep, apparently miles away from any form of attention, would instantly get up, go out and jump into my car. Even a human being, paying half attention, would hardly have caught the interjected sentence, but the dog never missed.

"In his case it was I who had to be on the alert all the time. If a friend inadvertently slapped me on the back, the dog had him by the arm at once, not biting him, but giving him a bad fright, until I spoke. Sometimes the clerks at hotels where we happened to stop would say, 'We don't permit dogs in here,' and I would reply, 'Well, put him out!' Germany would gravely stand up at the desk and put his paw over to shake hands with the clerk. That usually made him a welcome guest. In one of my business places he saw men go and come out of the stock room, and apparently took it all as a matter of course, until finally he nabbed one. How he knew is one of the mysteries of dog nature, but the man he nabbed was a thief."

ɤ ɤ ɤ

"I had a Great Dane which developed some strange traits of tenderness," said ***The Secretary,*** taking up the theme. "Out at my country place the children found a family of abandoned kittens in a ditch and carried them home. You know how unwelcome such things are, but the Great Dane seemed to share the children's regard for the little waifs. He began to mother them. He gathered them all within the curve of his warm body every night, and they snuggled in content. When they strayed too far, he used to round them back toward the house. When the children played too roughly with them, he seemed to know that even a playful cuff with his great paw would be too much for them, and he just gently pushed them away. At evening when he heard my car coming up to the gate, he looked along the drive, and if he saw any kitten walking there, he bounded over and moved it out of danger. It was one of those curious exhibitions of animal care which give one pause for thought as to what was at work within that canine brain."

ɤ ɤ ɤ

We were rolling down through Virginia on a night train, when ***My Southern Companion*** asked: "Did you ever see a Jim Crow car?"

"No," I replied, "but I've been reading or hearing about them all my life."

"Would you like to see one?"

"Yes. Where?"

"There is one on this train."

"This train! I thought it was all Pullmans."

"No, there's a day coach up ahead for the colored folks."

I couldn't get it out of my head that there was something contrary to all my notions of Jim Crow cars in the fact that there was one on *this train—this* of all trains.

"We can't discriminate against negroes down here," my companion was saying. "They have a right to ride on any train we ride on. We can't even give them old cars to ride in. If of two day coaches one is worse than the other, the worse one goes to the whites, to avoid breaking the railroad law against race discrimination.

"Would you like to see that car?"

"Certainly—lead on! Can we ride in it?"

"No, we can't ride in it."

"Why?"

"It's against the law."

"Suppose I don't want to avail myself of the law which protects me from the proximity of the colored man, what then?"

"Well, you will have to obey the law which guarantees the colored man protection against the proximity of you."

"Of me?"

"Certainly. If colored men can't ride in white men's cars, white men can't ride in colored men's cars. The negroes are entitled to the privacy of their own cars."

"Well," I reflected, "that's a new one to me. The color line is drawn against the one as well as the other."

"Sure," said my friend. "What kind of a color line did you think it was?"

"Then how are we going to get into that car?" I asked.

"Oh," he replied, "we'll just saunter in and go up to the front and buy a couple of packages of gum from the 'news butcher.'"

"What would happen," I suggested, "if one of your colored men should just saunter down through our car to get a piece of pie out of the diner?"

"That's a question that does not call for an answer—because—*he wouldn't.* Come on."

We went on forward. Finally through the swaying train we came to the Chariot of the Negro, and walked down the aisle. It was late. Here were young fellows, mostly alone, going south. A buxom colored woman or two, with the most extraordinarily colored hats, toppling at the most extraordinary angles as their heads swayed and wagged in sleep—all going south. Then colored families with pickaninnies—two, three, five to a family—the little ones laid out on the red plush seats, asleep. I don't mind saying that I like little colored babies. I suppose it is the appeal of the young of every species, but these are of the human species. When I see a colored husband and wife shielding their brood, I confess the parenthood in me answers to the parenthood in them. I find myself feeling somehow solemnly glad that the little pickaninnies are going to grow up in a better America. The South is spending more money on negro schools than before she spent on all her white schools. I was later to see hundreds of negro children, in city and country, flocking to the very best of modern schools. I have never seen anywhere a higher type of country school than I have seen in North Carolina. And twenty-five years ago that state was very near the foot of the column in the matter of education.

So the train swayed and clattered; the extraordinary bonnets being at increasingly precarious angles, the pickaninnies slumbered as peacefully as if they slept beneath a magnolia tree. We sauntered through and sauntered back. For a long time, in the seclusion of the Pullman, I thought of the Jim Crow car, but I can't say that the thoughts amounted to anything.

# Still "Gittin' Gold" in California

By WALTER PAINTER

There is a fascination about the discovery of oil. The story of petroleum in California is as engrossing almost as that of gold. Where the old-time prospector sifted the sands for dust and nuggets, the oil man drills into the earth for black gold. Fabulous fortunes have been made in oil, but vast sums of money have also been lost. This story of the Los Angeles district—where the success has been phenomenal—should not be taken as a boost for wildcat speculation. Well drilling is an expensive proposition; and haphazard drilling is seldom profitable. It is estimated by the United States Geological Survey, in fact, that 82 per cent of all wildcat wells are failures.

THE story of oil development in the greater Los Angeles district of Southern California reads like a romance. A few years ago only orange groves and subdivision stakes dotted the landscape. Now there are forests of oil derricks.

Los Angeles County alone produces more oil than Mexico. At its height the oil boom eclipsed even the famed California real estate boom. Angelenos (as the Los Angeles residents term themselves) are as glib with oil statistics as they are with real estate figures or movie information: California, they will tell you, produces one-tenth of all the oil produced in the world; the deepest oil-producing well in history was brought in last summer at 7,600 feet, flowing; California leads six oil-producing states combined; and so it goes.

The case of Signal Hill, greatest of Southern California fields, is typical of the onward march of the oil workers. This hill, at Long Beach, commanding a splendid view of the ocean, a few years ago, was a choice residential district with many beautiful homes and modest bungalows. Today it is everywhere dotted with oil well derricks. You will see some of them snuggling up alongside the garden wall of a quarter-million-dollar mansion. Hundreds of wells, too, have been drilled 200 and 300 yards out in the ocean. Incidentally, Long Beach boasts that the income from its municipally owned wells is more than enough to pay the expenses of the city government.

The Los Angeles district petroleum output comes from three major fields—Santa Fe Springs, Long Beach, and Huntington Beach. These districts are within fifteen miles of each other and can be easily reached in a half-hour's ride from Los Angeles. Although they are now rated as old fields, they averaged about 190,000 barrels a day during 1925.

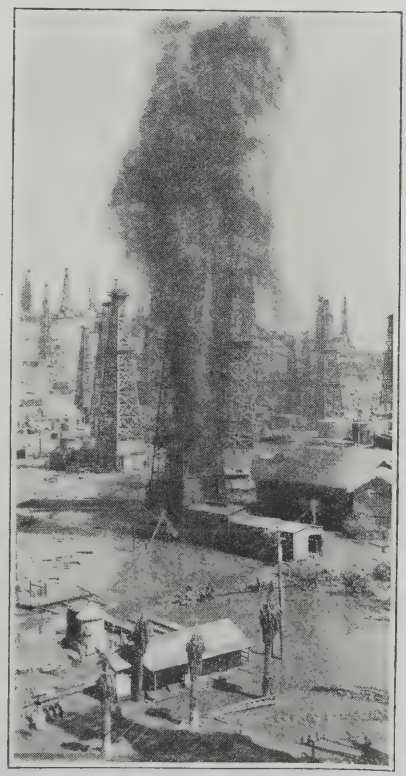
Crude oil accumulations are found in a coarse-grained porous rock which served as a reservoir. As most oil rocks are of a sandstone nature, they are commonly called "oil sands."

The source of oil itself? There are almost as many different theories as to the why and wherefore of oil as there are oil derricks. The two following speculations, however, are generally accepted as being most logical. Chemists argue that petroleum is the result of a chemical reaction between carbon and hydrogen after they have come in contact underground. Geologists hold that it is of organic origin, or the result of organic remains, either animal or vegetable, which have been stored up in the rocks since their formation. And at present this last theory seems to have the largest following.

An outstanding feature of the Southern California oil fields is the "juiciness" of their oil-bearing sands. These sands are from 300 to 1,600 feet thick. This uncommon thickness of the sands explains the continued big gusher production in the Los Angeles fields. California is noted for the long life of its oil wells. The first well drilled was near Santa Paula in 1866 and came in at a depth of 300 feet with several hundred barrels a day of heavy oil. Inability to control pressure caused sand, water, and rocks to clog the hole hopelessly. Going down later to a depth of 700 feet, a consistent producer was secured and the well flowed profitably for twenty years.

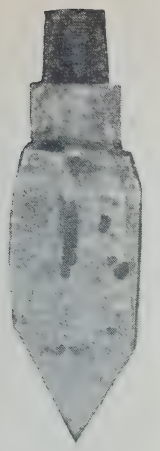
In general, the oil fields in the Los Angeles basin seem to run in three rather sharply defined ridges. One runs through the foothills and includes Olinda, Whittier, Yorba and Richfield. Another travels the middle of the great alluvial plain and touches Brea, Santa Fe Springs and Coyote. Included in the third is the chain of coast structures — Huntington Beach, Signal Hill, Compton and Torrance-Redondo.

Geologists say that it seems probable that these ridges or anticlines—formed by the folding upward of the geological layer and the erosion of thousands of feet of the upper stratas, thereby bringing the oil-bearing layers within reach of the drill bit—are only possible in one vast petroleum field. Drilling operations in these anticlines have shown the presence of three different oil-bearing sands. The first is usually tapped at from 3,000 to 3,500 feet, and the second is often found at from 3,750 to 4,250 feet. Reached at from 4,500 to 5,000 feet, the third sand seems to be the most productive. Each of the three levels consists of rather soft, coarse sand, fairly well sprinkled with small pebbles.

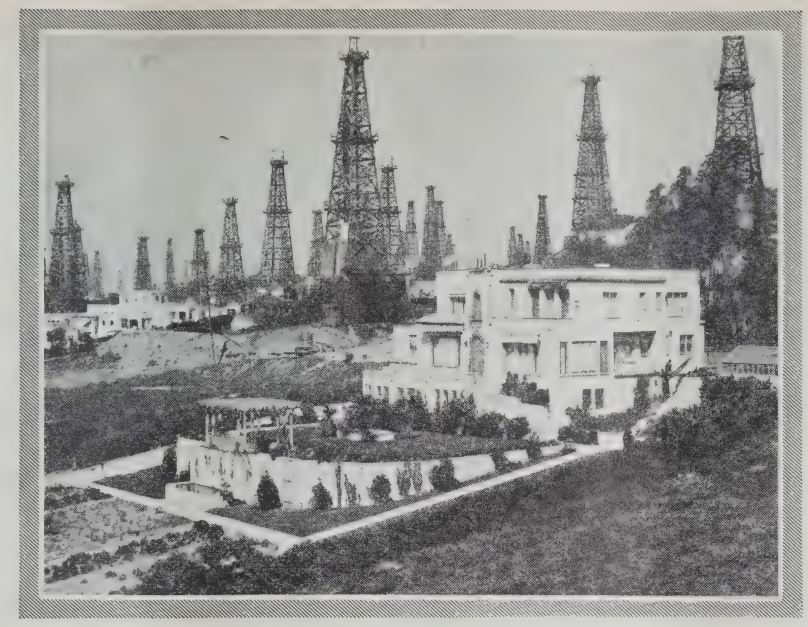


The Huntington Beach district did not jump out into the production limelight until the third sand was encountered in July, 1922. Since then the production curve has loomed up rapidly, an output of 110,000 barrels a day being reached in July, 1923. In Santa Fe Springs, too, the upper sands were quickly depleted, while the lower sands were responsible for greatest production. Long Beach, which is really Signal Hill, is still foremost because of an important field extension late in 1925.

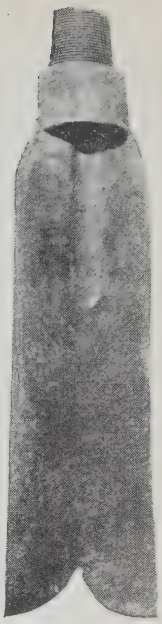
Inglewood, wholly developed in shallow sands during 1925, reached a peak of 118,000 barrels a day. The Ventura field, supposedly dried up, jumped from 7,000 to 35,000 barrels a day.



There are two common methods of drilling oil wells—the standard cable-tool system and the rotary system.



With the standard cable-tool rig, the percussion action of the drill bit—a heavy mass of sharpened steel attached to the cable which alternately jerks it up four or five feet and drops it—crushes the various rock formations. The crushed material is then removed by bailing. This method is commonly employed in penetrating hard strata like sandstones, limestones and hard shale. Most of the drill rigs working in West Virginia, Pennsylvania, Oklahoma, Kansas, and North Central Texas are "standard" rigs.



In drilling the fairly soft, unconsolidated beds of California, the rotary system is used most effectively. A rotary rig consists of a derrick, a revolving table, engines and boilers, and a bit at the end of a hollow drill pipe—the upper end of which is a square section called the "Kelley," wedged into the revolving table. As the table rotates it turns the drill, while through its

When an oil well puts on a big show, everything near it gets drenched.

Above, and extreme right—Two styles of rotary oil drilling bits, the diamond point and fishtail. Center—Illustrative of the battle that is taking place between fine oil wells and beautiful homes.

center a stream of mud and water flows to the bottom of the hole and is pumped up, carrying the earth and rock cut out by the drill. Each time the drill has gone down the length of the square section at the top, this section must be unscrewed and another length of drill screwed to the stem.

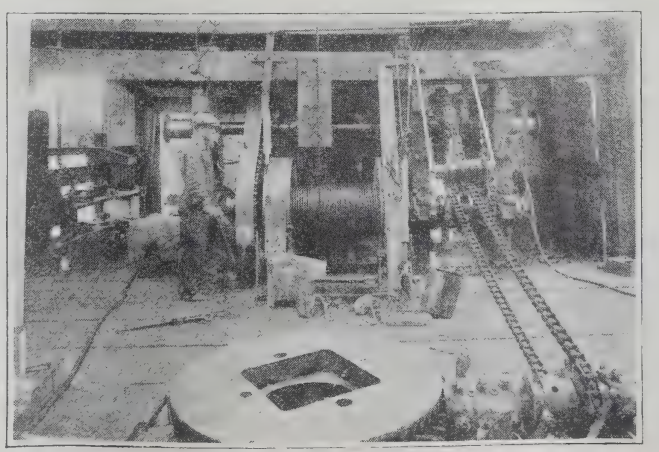
At frequent intervals the entire string of drill pipe must be raised and unjointed section by section and a new bit put on. It is then lowered and screwed together joint by joint. On a well 4,000 feet deep this job takes about four hours. Two types of bits commonly used in rotary drilling are the fishtail and diamond point. As much as 500 feet of hole has been drilled in 24 hours with these points.

Outside the drill stem as it goes down, a casing is lowered into the well to prevent cave-ins. This casing, often four to five thousand feet long, hanging free from the collar at the top, is also frequently raised and lowered.

When producing oil sands are struck, the well is cemented in. This is done by forcing cement down the casing by means of wooden plugs, the bottom plug having holes in it. Pressure on the top plug drives the cement out the bottom and up along the sides of the casing, thereby coating it tightly and shutting water out of the well. Any veteran driller will tell you, however, that there are about 926 different things that can happen to prevent this happy consummation, and most of them do.

Steam is generally used for motive power on rotary drill rigs. A drive chain from the engine runs over a sprocket on the main shaft. To this shaft are connected the drive chains for the lift drum and for the rotary table operating the drill.

Rotary drilling is heavy-duty, high-speed work. Virtually all California drilling contractors, anxious to reach the oil-sands before a neighboring hole can be completed, keep their rigs working 24 hours a day. And as the drive chain commonly runs at a speed of 1,900 feet a minute and is subjected to sudden and severe strains, it must be extraordinarily strong. Much of the chain used in California is all-steel, with notched-out sidebars to reduce "whipping" and is built with special alloy steel pins to withstand heavy wear.



As a rule, a rotary drilling crew consists of a driller and five helpers. The driller is the "man behind the gun." From his post he controls the engine, hoist, drilling, and the entire operation of the rig. Good drillers are skillful and resourceful men and are usually far above the average worker in intelligence. Many of those now working in the California oil districts have "made hole" in Texas, Mexico, Russia, and Mesopotamia.

The "roughnecks," as oil-workers are commonly dubbed, are well accustomed to the hardships of living in desert country and the loneliness of small, mushroom towns. Consequently, it is especially interesting to watch the way these men react to the conditions in California, where they have a chance to work at their business, one of the best-paying trades, without the usual isolation and the oppressive heat of sun-parched prairies.

Today the Southern California driller, earning $8.25 a day (the big companies have been paying bonuses varying from $1 to $3 in addition, while the smaller ones always pay higher wages for quick work in reaching the sand), finds himself with a California bungalow set back among orange trees. At Signal Hill and Huntington Beach fine bathing beaches are but a short distance away. Other factors work to the advantage of the driller and his coworkers in this Southern California oil era. Educational facilities near at hand, laws of safety in the operation of drilling rigs, and conditions governing comfort in the fields and at the wells, have all contributed to making the drillers contented and prosperous. Practically all the men are interested in some well of their own—some "wildcat" testing out a new locality or some little ten-acre piece located in the "heart of production."

Oil drilling, like big game hunting, has its allurement and fascination. The thrill of bringing in a great gusher is one of them. Months of drilling with no assurance whatever as to the results, the solving of hundreds of difficulties which arise as the work progresses, all kindle the expectations of the drilling crew to a high pitch. Finally the day comes when, with safety valves set, tanks and pump ready, the completed well is bailed or swabbed out until the pressure of the gas upward overbalances the weight of the great column of mud and water in the well and with a roar the mud and oil shoots high over the top of the derrick. Then as the well scours itself of the tons of mud which have been forced into it during the drilling, the great golden geyser starts pouring itself into the tanks and pipe lines.

Oil is a queer thing. Sometimes when you are out gunning for it, it puts its tail between its legs and heads for the horizon; again, when you don't do a thing in the world to encourage it, it will drench the whole countryside. One year, for example, a well at Long Beach, that had been

Oil driller working a rotary rig. Twenty-four hours a day drilling is the rule in almost every race for big golden gushers.

doing 2,000 barrels a day for some time, suddenly took matters into its own hands and began booming out 25,000 barrels a day.

Occasionally, when hard, fine-grained rock areas are encountered it is necessary to stimulate oil production by opening up channels in these areas and making more seepage space in the hole. The hole is then "shot." Many field men will tell you stories of wells that showed scarcely a rainbow of oil, which when shot made big wells. In shooting wells the operators determine from the character of the sand how much nitroglycerin to use.

"Shooters," the men who put the charges in the wells and fire them, are a fearless crowd. They transport the glycerin in lead-lined cans, and drive their "soup wagons" over bumpy roads as calmly as a farmer takes his milk to town. Once in a while the papers report "shooters" blown to atoms. It is believed that many such explosions are due to the high heat produced by chemical action where some free acid is present in the glycerin.

Among other things, California has its share of "wild wells." Just remember that with a gas pressure of 700 pounds or more to the square inch it is quite a trick to cap and control some of these geysers of gasoline and grease.

A runaway well, spouting out a sea of sand, mud, rocks, and oil, can easily destroy the derrick and quickly "goo" the surrounding landscape. Blow-outs, gushers, fires and explosions are among the things that are apt to happen. Not long ago the lives of fourteen workers were snuffed out near Karens, Texas. A spark made by two clashing bits of metal as the men tried to cap the Hughes gusher set off a pillar of fire that burned for days. Soaked to the skin in oil, these fellows didn't have a ghost of a chance to escape. Clad in asbestos suits, a crew of wild-well fighters rigged up sixteen boilers and put out the blaze with powerful jets of steam.

Deep-well drilling has definitely proved that oil in large quantities may be had at horizons below those which have been heretofore developed. Some oil men think that by re-drilling approximately 50 per cent of all the wells in California, these wells may be able to produce as much oil as they have yielded during their entire life to date.

Although experienced drillers say it is possible to develop tools which will penetrate the earth to a depth of 8,000 feet, the feasibility of deep-well production will depend on the expense of drilling and the market price of oil. When a well is drilled below 4,000 feet the drilling operations become exceedingly hazardous due to the greater gas pressures encountered. Then, too, the cost of fishing jobs mounts rapidly at the lower levels.

Long Beach boasts one of the deepest producing wells in the country—the General Petroleum Corporation's Black and Signal well which was brought in at a depth of 5,430 feet. It rolled up an initial production of 12,000 barrels a day from 1,500 feet of oil sand. It is a re-drill from the 3,246-foot mark at which it did only 2,000 barrels a day.

Nine out of ten laymen probably have the idea that the one big job in the Southern California oil fields is in the drilling of the wells. In many instances, however, the handling of the enormous floods of oil after they spout up from the ground furnish more thrills an hour than those found at the drill rig.

Struggling at first to handle a great production with inadequate storage and transportation facilities was a real job. To cope with the storage situation, one of the largest tank farms in the world was constructed at Watson's Siding, just outside the city limits of Los Angeles and Long Beach. It covers 1,000 acres of land and has a capacity of more than 15,000,000 barrels. Pipe line systems are being rapidly expanded and tank ships have carried crude oil from Los Angeles harbor to Atlantic and Gulf Coast points at the rate of 200,000 barrels a day.

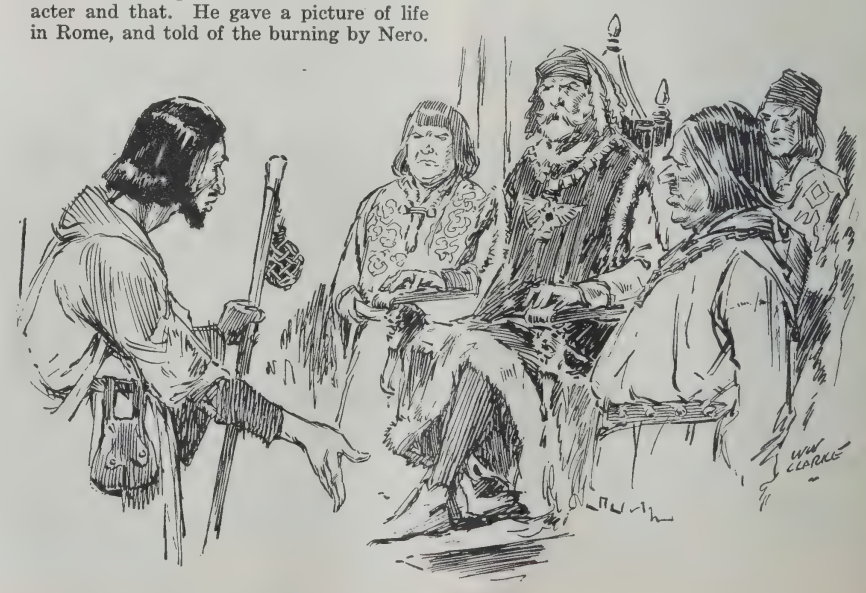
One pipe line system alone recorded, on several occasions, a flow of oil through its line of more than 190,000 barrels a day. It is of interest to note here that the first pipe line ever constructed—a three-mile job built in Pennsylvania back in 1865—had a total daily capacity of only 80 barrels.

Probably one of the most roving and colorful figures in the petroleum industry is the "pipeliner." He is the man who lays the pipe lines through which oil is transported from the fields to storage, and from storage to coast terminals. The dyed-in-the-wool pipeliner seldom shifts occupations. He cares little about the actual drilling operations in the field through which his line is being laid. He wouldn't take a job on the rig unless pipe work was at an absolute standstill. He follows the line, gradually settling into those independent ways of the pipeliner. He does a turn on an old-time line in Pennsylvania, probably drifts into Tulsa for a spell; then he hears of better pickings out in California, and hits the trail for Los Angeles. But always a pipeliner.

Isolation of the gangs while on long jobs, working through unsettled mountainous or wooded sections of the country, has knit them closer together and set up a peculiar preference for their own type of work and the associations formed on and off the job.

One of the quickest jobs of pipelining ever accomplished in California was the laying of a line from the fields of Coalinga, Midway, Kern River, and McKittrick to tidewater at Port San Luis in 1909-1910. Started in July, 1909, the system, with its 205 miles of main pipe line, its fifteen main-line stations with huge pumps, heaters and storage tanks, was first put into operation on March 8, 1910.

An idea of the swift progress made can be gathered from the fact that a tong gang of fifty men and a regular ditch crew laid, ditched and covered 283 joints of the 8-inch pipe in nine hours. This represented the completion of more than a mile and one-eighth of pipe line a day.



# The Wandering Jew

AMONG the odd impostors of the world is one who styled himself the Wandering Jew, and who appeared in the city of Munich, July 22, 1721. Some account of him may be found in the second volume of Calmet's *Dictionnaire de la Bible*, page 472. Then, as now, men were curious and credulous, and the rich were eager to be entertained. So things went well for the stranger, who was one able to adapt himself and to get into the swing of conversation with ease; and soon he was taken seriously.

He told how he had been an officer of the Sanhedrin, how he had struck Christ as He left Pilate, what he had said to this Apostle and that. With a sympathetic audience to hearten him, he went on to relieve his artistic soul, telling of the dress and the manners and the amusing eccentricities of this character and that. He gave a picture of life in Rome, and told of the burning by Nero. There were tales of others he said he had met and lived with, of the fiery Saladin, of Tamerlane, of Bajazeth. He had, he said, been on familiar conversational terms with the leaders of the different crusades.

Doubtless he was a novelist born out of time. At least he seems to have been gifted with admirable powers of observation and a retentive memory, and the scenes he depicted were passably accurate. Professors from Oxford and Cambridge questioned him narrowly without detecting serious anachronisms, and linguists asserted that he spoke many languages with ease.

After some months in Munich he went to Denmark, then took ship for Sweden and thereafter disappeared.

# Woodrow Wilson—the Unforgiving Minute

(*Continued from page 2*)

transmitted to President Wilson hundreds of applications for pardons. He reviewed every case. He talked with me about many of them. He studied them with all the care that would have been exercised by an appellate judge with unlimited time, yet he acted promptly. The papers always came back in a very few days after I sent them to the White House."

Every administrative officer of the government of the Wilson régime tells the same story. Because of these habits Wilson was seldom behind in his official White House schedule. His office hours were from 10 a. m. to 1 p. m., during which time he saw callers by previous appointment, arranged through secretaries. Most engagements were for ten or fifteen minutes, or an average of twelve persons each forenoon. For years it had been a sore trial to the secretarial staff in the executive offices to run the forenoon schedule off on time. The tendency is for one caller to lap over a minute or two. The next may lap over two or three and the effect is cumulative. By one o'clock the President may be half an hour behind.

Such a thing rarely happened in the Wilson Administration. Methodically and systematically, yet with every courtesy, President Wilson disposed of each caller on the second that his time expired, or perhaps a few seconds ahead of time. As a result he nearly always had a leeway of four or five minutes at one o'clock. The same regularity applied to meals and other domestic engagements in the main White House.

"In the whole time that Mr. Wilson was in the White House, until the day he was stricken," said one of the Secret Service men who was constantly with him, "I never knew him to be so much as a minute late for any appointment, engagement, meal, ride, or other thing that had been previously arranged."

Wilson's control of his mind included the ability to detach himself from a situation and look at it impersonally.

"It seems as if I can see myself and the campaign from a distance," he remarked, in discussing the 1912 political issues one afternoon.

Wilson also had the mental habit of filing men and things away in his mind, for future reference. Many people did not understand this characteristic; did not even know of its existence. It caused some trouble because frequently some man would take offense. He would not know he had been filed away, in a safe, secure spot all his. He would think he had been "dropped." As a matter of fact he had not been dropped at all. Wilson's regard for him was as deep and sincere as ever. When the time came for a resumption of relations with that man he would find Wilson had not changed a particle.

(*C*) *Press Illustrating.*

President Wilson and Secretary Baker on reviewing stand during parade of soldiers returned from overseas. Above—William McAdoo.

While the President had an official question under consideration he saw a great deal of the particular official, Senator, or Representative directly concerned with it. Until it was disposed of he and that individual were in daily, almost hourly, contact. Finally, the case would be ended, whereupon he would immediately turn his attention to some other problem and apparently "take up" some other official, with whom he would be on terms of apparent intimacy for days, weeks, or months, according to the nature of the case. Then his association with that official would as suddenly cease. His object was served.

For instance, in the 1912 campaign William G. McAdoo was for most of the time vice-chairman and the actual directing force in the Democratic National Committee. Mr. Wilson saw him constantly for four months. McAdoo was at Seagirt and Princeton every few days when Governor Wilson was in New Jersey. He took frequent trips on the candidate's private car, from state to state where Wilson made speeches. They communicated every day by telephone or telegraph and became the closest, most intimate friends. Finally election day in November arrived. McAdoo voted early and went to Princeton, to spend the evening with Governor Wilson, getting returns. The next day he returned to his office in New York and Wilson apparently dropped him. McAdoo never laid eyes on the President-elect again until March third, the day before inauguration.

Governor Wilson went to Bermuda for a month's rest immediately after election. Returning he spent the winter at Princeton and Trenton. Cabinet discussion was rampant. Wilson apparently ignored McAdoo as if he had never heard of him. It was only a dramatic example, however, of Governor Wilson's mental habits. The association with McAdoo during the summer and early autumn had not been for personal reasons. It had been personally very delightful, very amiable, very charming, but in Mr. Wilson's mind it was incidental to the task upon which he and McAdoo were working, the task of bringing success to the Democratic ticket. When that task had been completed, there was no longer any reason for the intimate association between them.

Mr. Wilson would have liked to continue the relationship. He had come to have great respect for McAdoo's ability and he had developed a deep affection for him, but the "unforgiving minute" was pressing him, harder and harder. As President-elect he had much to do, but it was a different job from that on which he and McAdoo had been working. It necessitated his seeing other men, spending many hours with them, discussing many things—all unrelated to the election, which McAdoo had helped bring about. Therefore, Mr. Wilson filed McAdoo away in his mind, shut the door to keep him warm, and turned his hand to other work.

A short time before inauguration he opened the door again and brought McAdoo out. Stepping into his tele-

President Wilson and Attorney-General Palmer at the White House visited by officers of seven states, to discuss the high cost of living. Front row—Governor Sproul, Pennsylvania; Attorney-General A. Mitchell Palmer, President Wilson, and Governor Gardner, Missouri. Rear (left to right)—Brigadier-General Berry, Pennsylvania; Governor Milliken, Maine; Governor Cooper, South Carolina; Governor Campbell, Arizona; Attorney-General Gose, Missouri; Governor Brinquist, Minnesota; M. C. Riley, Conference Secretary; H. S. McDevitt, Secretary to Governor Sproul; Lieut.-Governor McDowell, Montana.

phone booth in his office in the capitol at Trenton one day he called McAdoo on the telephone in New York and asked him to be Secretary of the Treasury.

In the early days of the war Washington came to the conclusion that McAdoo was to be the President's right-hand man during the great struggle. For weeks Wilson and McAdoo were intimately associated. The Secretary of the Treasury, then the President's son-in-law, spent hours at the White House. President Wilson often stepped across to the Treasury Department and had long conferences with him. They talked on the telephone a dozen times a day. They went to the Capitol together and interviewed Senators and Representatives in the President's room in the north wing.

Then, all of a sudden, the President quit McAdoo and took up Secretary of War Baker. The same sort of association was now held with the Cabinet Minister whose office was on the opposite side of the White House. Instead of going into the Treasury to see McAdoo, the President was crossing over to see Baker nearly every day. He and Baker were going to the Capitol together and working together in the President's library far into the night. Soon the gossips got busy. McAdoo was taboo, Baker was the power behind the throne. Anybody desiring anything from the Administration would do well to consult the little gentleman from Cleveland. McAdoo no longer had the pull.

***From the Treasury to the War Department***

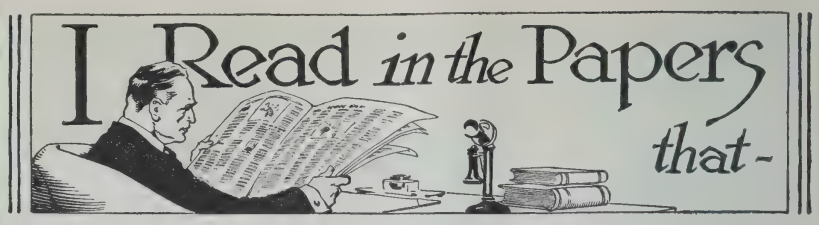
High government officials and members of Congress in important positions placed this construction on the incident, the explanation of which was simply this:

Early in the war the President and the Secretary of the Treasury were busy getting the finances of the country ready for a titantic struggle. A little later this was finished. The details were left to McAdoo and President Wilson turned to the War Department, where he and his War Secretary had to get busy raising an army and mobilizing the industrial forces of the country.

One job called for close association with McAdoo. The other called for close association with Baker. Neither association was due to a personal desire on the part of the President for the society of either gentleman, but to the necessities of the situation. The "unforgiving minute" was crowding harder than ever. Each one had to be filled with "sixty seconds' worth of distance run." None of them could be used by President Wilson discussing finances with the Secretary of War, or military matters with the Secretary of the Treasury. This did not mean that President Wilson had "dropped" either man. His regard, respect, and affection were stronger than ever. It merely meant that he could not, at that stage of the game, waste any "unforgiving minutes."

***His Mind Was Free of Useless Things***

In varying degree the principle of operation illustrated by the foregoing incidents was applied by Wilson to his whole life. He did not clutter his mind with useless things. His mind was as clean and orderly as his desk. When he did not need men or things in the business at hand he put them out of his active mind to give it freedom to deal with the present, pressing problems.



Every administrative officer of the Wilson Administration at one time or another saw the innermost workings of the President's mind and observed his ability to control it. It was a subject of amazed comment whenever the Wilson officials got together.

"Sometimes I felt as if I could almost see the shutters open and close," an associate once remarked to me, as we were discussing this characteristic. "I would go to see him about some question in my department upon which we had conferred some time previously. When I would mention the subject his face would sometimes be an absolute blank. It would be apparent that he had filed that fact away and could not, at the instant, bring it out again. Sometimes he would run his hand over his eyes or look out of the window. Then suddenly his face would light up. His mind would dart back to the exact spot where we had left the discussion, perhaps two months before, and he would go on as if the interruption had been for only a few minutes."

Commenting himself on this characteristic, Mr. Wilson once remarked:

"I can usually call up every bit of necessary information on a given question if I have ever studied it, but I have one habit that is sometimes embarrassing. In cases in which I have reached a conclusion I am very likely to forget the evidence. I will remember distinctly that I reached a conclusion and that the evidence was so direct and overwhelming that I knew the conclusion to be sound. I sometimes glibly state the conclusion and then, when called upon for my reasons, discover that my mind is absolutely blank."

Friends of Woodrow Wilson, with a bent for psychology, explain the above on the theory that Wilson's subconscious mind had learned to discard useless matter. His conscious mind definitely retained the conclusion, which was useful and important, but automatically threw away the reasons therefor to help him "fill the unforgiving minute with sixty seconds' worth of distance run."

some wide-awake botanists of the Department of Agriculture have deplored the fact that there is too little criticism of the contributions to nature study. This, however, applies far more urgently to the field of zoölogy than to that of plants; it is pretty hard to imagine wild flowers performing the wonderful stunts that are so easily attributed to reptiles, fish, batrachians, birds and mammals by those writers who are mainly seeking reputation and dollars.

Is it not time that the natural scientists notified the editors of papers, periodicals and publishing houses to stop the printing of wild tales full of the most absurd errors? The penalty might be the immediate denunciation of such stuff in the critical columns and reviews. Or are our scientists generally a law unto themselves, with only a selfish interest in the advancements of their own hobbies, however much they may prate of the need for education?

Editors as a class, with some notable exceptions, are as gullible as their readers; to this they add selfishness in the desire to interest their readers and sensational stuff will do this better than a strict adherence to the truth. Thus, we have tales of reptiles charming their victims, of swimmers stabbing sharks, of wildcats fighting to the death, of weasels exerting some kind of hypnotic power over defenseless rabbits, of pythons, big enough to swallow an ox, that kill by a blow from their tails, of spider bites that are deadly, of birds that fly a hundred miles an hour, of snakes that can travel faster than a man can run and can leap from the ground, of a great host of creatures that employ degrees of reasoning and sentiment equal to those of man.

The lamented Theodore Roosevelt started the war on nature fakers. Oh, for more such as he to keep them in bounds, despite the preferences and ignorance of many editors! Unfortunately a comprehensive knowledge of the natural sciences is altogether rare, even among highly educated persons.

* * *

Professor Walter B. Pitkin, of Columbia University, has conducted a series of experiments which seem to demonstrate that the so-called flaming youth of this generation is much better informed about the moral precepts of the Bible than is assumed by those who are quick to condemn without first obtaining the facts. What is even more significant these youths quote the Ten Commandments more fully than their elders.

Fifty-nine men and women of mature years and education and of distinction in the professions, in literature, in business and the church were asked to write down the Ten Commandments, not necessarily in the correct order, or literally. The average number of Commandments named by these persons was less than six, and only one person, a professor of philosophy, knew all the commandments.

Fifty-two college students, stenographers, young actors and clerks, revealed, on the average, a knowledge of more than six commandments.

* * *

an interesting contrast was presented before the special Senate Committee investigating the effects of the Volstead Law. Said Russell Lee Post, youth chairman of the *Yale Daily News*, relative to prohibition sentiment at that university: "The greater the attempts at enforcement, the stronger the sentiment against it."

Said Amos Alonzo Stagg, famous Yale football star of bygone years and now University of Chicago coach: "When I went to Yale I saw many of my college mates get drunk. They did not always get drunk on the beer, but they got drunk on the wine when they chose to drink that. I want to say this: that the University of Chicago from the beginning took a strong stand against drinking, and the officers of the university and members of the faculty created a sentiment against it, so that there has never been anything like the drinking at the University of Chicago that I saw at Yale. And I can say this with honesty, that there has not been nearly so much drinking since prohibition came in as before."

# A Year of Thirteen Months?

(*Continued from page 3*)

the lead. The priest-astronomers could use that hole just like a lead in the pencil and make markings in the sky; so that, little by little, they came to know when a certain group of stars passed the hole. They tagged these stars with animal shapes, called them constellations, and we are still running on that vocabulary today.

Later on, when the Romans conquered the Egyptians, they took over the Egyptian calendar, but the Romans were superstitious about the number of days in a month. Julius Caesar, therefore, mixed up the calendar a great deal by making as many months as possible number thirty-one days. There is where the human relationship gets confused with economics. Julius Caesar and Augustus Caesar were both great politicians and each had a month named after him. Their politics got the better of their judgment, and they put a crimp in the calendar which has persisted to this day.

Now, leaving aside for the moment the historical part of it, what is the real problem? It can, I think, be put very simply, so that any schoolboy can understand it. And for this reason, besides a number of other reasons which will be apparent to anybody, it is very interesting.

Without allowing for fractions (which can be disposed of in other ways) it takes the earth 365 days to revolve around the sun, and it takes the earth twenty-four hours to rotate on its own axis. Now if the reader will fix in his mind these two sets of figures, he will see immediately that 365 days cannot be divided into any number of equal parts without having a day left over. Also we shall see that, as our calendar is at present, if 365 days are divided into twelve parts, some of those parts (or months) must have more days than the others.

Owing to this discrepancy, we have to worry through every year, never feeling quite sure how many weeks there are going to be in a month, and in all sorts of difficulties with regard to making dates, an examination of which must convince anybody that our present system is inadequate. It must be understood, of course, that we have become so accustomed to these difficulties that we really don't know how bad they are until we face them calmly.

Then again, we must remember that other nations, other religions, have had other calendars. Now that the whole world is being more closely knit, and we are trying to put over as best we can the idea of the brotherhood of man and the abolition of war, we must have an exact method for measuring time which will be universal; that is good anywhere on the globe.

In a small way, we have had an object lesson in daylight-saving.

Long before the war, daylight-saving had been a subject for investigation by a number of experts, but it was not until the necessity for saving confronted us in its very immediacy that we put daylight-saving into practice. And as this world necessity now confronts us, we are certain to make such changes in our calendar as will help us by so much to solve the economic problems of the world.

| Sun. | Mon. | Tues. | Wed. | Thur. | Fri. | Sat. |
|---|---|---|---|---|---|---|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| 8 | 9 | 10 | 11 | 12 | 13 | 14 |
| 15 | 16 | 17 | 18 | 19 | 20 | 21 |
| 22 | 23 | 24 | 25 | 26 | 27 | 28 |

"Sol" the proposed new month.

There are other plans for revising our calendar, but I have not mentioned them, because I do not want to confuse the reader. Furthermore, these plans are nearly all basically the same.

Put in a nutshell, it is simply this:

Make every month consist of four weeks.

Make every year consist of thirteen months of 28 days each.

The additional month should come between June and July and be called "Sol."

Every year there will be one day left over and this is to be considered apart, possibly as a kind of international holiday.

Every four years (leap year) there will be another day to be disposed of in a similar manner.

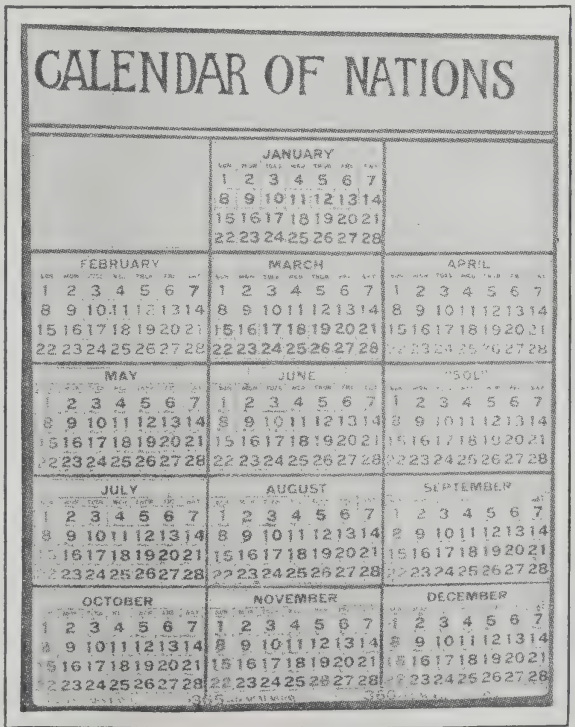
What are the objections?

First, that the introduction of another month with a new name is going to get us inextricably confused with regard to the past. It will be good for the printers, but bad for those who are trying to link the past with the present because we shall have to learn history all over again with regard to dates. This, of course, applies especially to children, who will have two sets of dates before them.

Another objection is that the number thirteen is considered unlucky. This will be dismissed by most sensible persons as negligible. Nevertheless, it influenced the greatest statesmen of ancient times and it must be taken into account.

I have said that all economic problems are intermingled in some manner with human relationships, and we must therefore expect to find that this is the case with our proposed calendar reform. Where human relationships enter into economic problems in the right way, these problems are often solved; indeed, they are always solved. But where they do not enter in the right way, then the problem hangs fire.

In the case of calendar reform, it is fortunate that, as a story—and a fascinating story it is—it hangs so closely about the personality of one man.



Of course, ever since the year one, a certain minority in each generation have studied the calendar, have known about the phases of the moon, have concerned themselves with the rotation of crops and the sun's varying heat during the regular periods when the earth has revolved around the sun.

But it does happen that as far as this present calendar revision is concerned, Moses B. Cotsworth, F. G. S., F. S. A., F. C. A., the secretary-treasurer of the International Fixed Calendar League, has probably done more to rouse the world to the necessity of the change than any other single personality of this generation.

For many years Mr. Cotsworth has been traveling up and down the earth studying its movements from various points of view in relation to the sun, moon and stars. Much more than this, he has looked at the whole problem from the economic-historical standpoint, and there is practically no phase of it about which he has not acquired all the data that can be obtained.

Mr. Cotsworth was born near York, England, near by what are known as the "30-ton arrows" which mark the site of the earliest capital of the ancient Britons who, as he relates, had as leading advisors "the thoughtful Druids about the time that Jacob lived and who used the 'amplitude method' to locate the seasons by the south, east and west sunrise points."

These three arrows are huge monoliths placed there by the ancients. Mr. Cotsworth was able to see that these arrows were in effect nothing but a Druidical sunrise observatory, and that by viewing them from a point in line

How a calendar consisting of thirteen months would appear. "Sol," the proposed new month, is shown inserted between June and July. Would superstition object to this thirteen-month calendar because "thirteen" is considered unlucky?

with the central one, he could tell the seasons in relation to the sun. In his travels through the Orient, he was able to prove that obelisks, which many had heretofore supposed to be merely ornamental or artistic, were for the purpose of acting as sundials.

When in 1900 he visited Rome, he examined the world-renowned obelisk in the center of the Piazza of St. Peter's Church, and became convinced that somewhere near, on the surface of the earth, there would be found the solution. He found that at a little after 6 a. m. the meridian line of the obelisk was truly oriented along the north side of the roadway from south to west. "That is, marked by the granite midday measuring line between the oval marble disks which located months and seasons by shadow-lengths. In January, 1900, I found the significant words *canceri solstici* still readable, though much worn, on the oval nearest the obelisk, manifestly recording the fact that the Catholic Church authorities, who brought the obelisk from Egypt in 1586 to commemorate the last reform of the calendar by Pope Gregory the Great in 1582, had not neglected to lay down that meridian line with its crowning indicator disk engraved with those two words, indicating that when the sun reaches its highest point on June 21, the obelisk's shortest shadow is that moment registered at S, on that oval marble marker."

***The Obelisk as a Time Recorder***

Little by little, as Mr. Cotsworth accumulated data, he became more convinced of the necessity of calendar reform, and this from purely practical economic motives. In 1908 he visited the Sarcee and other North American Indians and discovered that long before the coming of the white man they had evolved a system of telling the seasons. They made five bundles of sticks, having thirty sticks for thirty days in each of their always equal months. The stick at the end of each bundle was drawn each morning from the monthly bundle of thirty and showed one day. Their year began with the first day the spring thunder brought rain.

Mr. Cotsworth tells how the Hebrews differed from the Egyptians in their method of reckoning.

"The more practical Hebrew patriarchs, by more careful and exact observations of the sun's seasonal points at sunrise, were led to drop their five equal months, totaling 150 days for the more seasonable six-month year, which Jacob tallied by his three rows of stakes lined to sunrise on the longest, shortest, and equal day-and-night points to obtain increases of lambs and kids yearly, as is now done in England and British Columbia, where both grazing and weather conditions permit. As sheep and goats were not only the means of exchange but the chief wealth of Jacob and his descendants, who traded upon the facts that these animals carry their young only five months and can be made to breed almost every six months, Jacob's descendants naturally continued his method of six months count until Moses, at the Exodus, gave them the more advantageous calendar year. And it is a significant fact that after the Exodus the length of life of Bible worthies accords with our own. Moreover, when we compute the recorded ages of earlier patriarchs into true years on the basis of the one, five or six months calendars, which were then in use, we find that they lived only the normal number of years, as the following table of typical adjustments shows:

***Methuselah's Years Maybe Were Moons***

"Methuselah's 'years' were moons, totaling 79 true years.

"Abraham's 175 'years' of five months totaled 72 true years.

"Jacob's 147 'years' of six months totaled 73 true years."

Mr. Cotsworth came to America from England in 1903 and in 1907 to establish the International Fixed Calendar League's American section. In February, 1912, the convention of European advocates met at Liége, in Belgium, and decided to take up the problem with more vigor. Their efforts resulted in the international chambers of commerce passing a unanimous resolution in favor of fixing Easter and improving the calendar. Nothing more was done, however, on account of the war. But in February, 1922, the Liberty Calendar Association, of which Julius Barnes is president, called a convention in Washington to select the best plan. Eleven plans were then submitted and Mr. Cotsworth's plan was voted the best and commended to the governments of all nations. The Canadian Government had already accepted the plan, and thereafter the proposal for the change was sent to the League of Nations.

"Meanwhile," states Mr. Cotsworth, "the International Union of Astronomers had committees in every leading nation considering what action they should take toward assisting calendar reform at their biennial congress during May, 1922. The result was the decision that, provided no effort was made to alter the length of the year nor the commencement of each year on January first, they would be glad to leave the reform of the calendar to the governmental commercial and social leaders for decision by an international conference."

***Many Large Businesses Would Benefit***

As far as other nations are concerned, it should be understood that already about 326 millions of Hindus, Mohammedans, Buddhists, Confucians and other religions in India, Siam and the Malay States have united in the observance of Sunday as their universal rest day.

In 1923 the Russians and other authorities of the Greek Church agreed to forsake the old-time Julian calendar (thirteen days behind the world), and this largely owing to economic pressure. The Pan-American Union, consisting of twenty-one South American republics, is all for the change on the new plan. It seems probable that at the next meeting of the League of Nations, unless hitherto unforeseen obstacles arise, the new calendar will be in shape to be ready for adoption in 1928.

"Many large businesses," says Mr. Cotsworth, "such as the meat packing companies in the United States and Canada, tea companies, moving pictures, newspapers, magazines and others, have found it necessary, for efficient business control, to abandon misleading monthly accountings and devise arbitrary periods of regular four and five weeks to enable them to conduct their business on the basis of sure facts, whereas our ever-changing days in unequal months make monthly totals misleading. In department and dry-goods stores, Saturdays and Mondays are the busy days. In banking, Fridays, Saturdays, Sundays and Mondays bring different percentages of business. In nearly all such concerns, each day of the week has a different economic value from the other six days."

To sum up, here is Mr. Cotsworth's synopsis of the proposed reform in the calendar:

"Every nation now calendars the days of the year in seven-day weeks, although weeks were not in use when the different calendars of unequal, inconvenient months were imposed upon our ancestors by the Roman Caesars 2,000 years ago. We cannot alter the length of the days, weeks or years, but we can easily amend the months so that each, like February in 1914, will contain 28 days as 4 full weeks, which exactly and best quarters the month for business and social convenience. That ideal month is the standard proposed. To expedite long counts of days between any two dates, it would be better to *number*, instead of to *name*, the months; but if names are more desirable, the new month 'Sol' could be inserted between June and July as readily as 'leap-year' was inserted between February and March, 1924.

"This proposed new month, with the other twelve equal 28-day months, will constitute the amended calendar year proposed, after the 'Year-Day' (without any week-day name) is appended as last day, an International Sabbath, to be included in the last year as its eighth day and dated December 29th.

"This will absorb the extra week day (over and above the 52 weeks) which now needlessly and most inconveniently causes the names of all week days to change throughout the successive 365 days of each year. In leap years 'leap-day' should also be an International Sabbath without a week-day name, simply named 'leap day' and included in the last week in June as its eighth day and dated June 29."

In case the new calendar is adopted, one class of unfortunates will mourn, namely, those who were born after the 28th of any month. Alas! they will have no birthdays—or perforce adopt new ones.

---

# Teach Your Boy to Work

(*Concluded from page 8*)

Make your boy a master of some kind of soil production, even though it be tiny and amateurish, and you thus give him a key to the entrance into many of the kindred industries. And you give far more than that, namely, a degree of self-reliance, and initiative which he can scarcely acquire from any other practice. There is something about the handling of livestock and the management of farm machinery which gives a youth a sense of manliness and supremacy over hard conditions. Fortunate indeed is the city youth who is privileged to rough it for a season, with decent associations, on some good Western ranch.

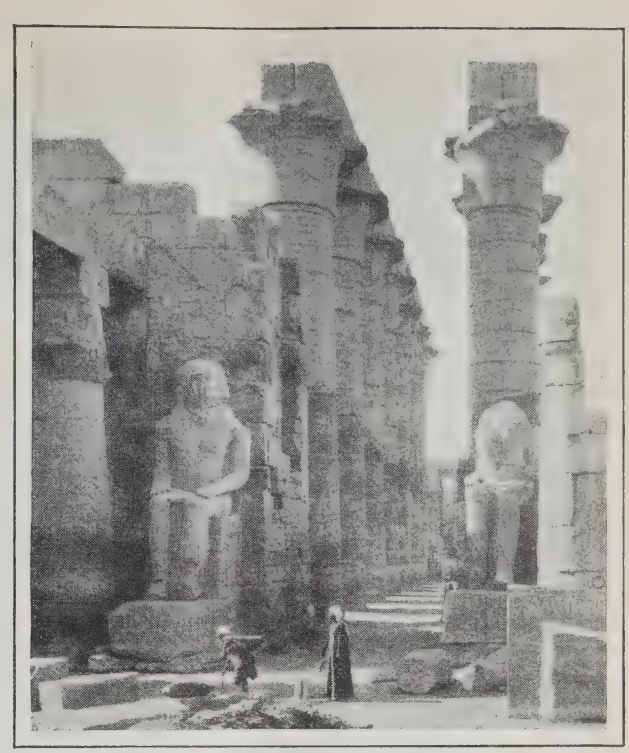
Finally, understand that soil culture is but a part of soul culture, and soul culture is but another name for bringing out of the individual, through practical application, those instincts and desires which are common to the race. It is the common man, unfolded to the point of appreciation and application of all the great racial tendencies; it is this common man who by this very procedure becomes the great man. Teach your boy to work and thus unfold a quarter section of the great, inherent human nature within him. His advancement in worldly goods and wisdom will then take care of itself.

# New Light on Old Egypt

(*Continued from page 6*)

official god of Egypt. This heretic, this dreamer, this dabbler in the fine arts, this uxorious esthete, tried to rescue Egypt from the rule of polytheist priests. And this boy son-in-law was not strong enough to carry out his predecessor's reforms. He moved back to Thebes from Tel el Amarna, or the city of Ikhnaten, and changed his name to Tut-ankh-amon. Then he died, while still a boy. Six years he had reigned, and they were exciting years, years of reaction. The priests must have had their own way mostly. He was not strong enough, nor great enough, to withstand them.

But his wife was a girl of some character. When her husband died, she knew that she could not hold the throne without a husband. She had just about sixty days in which to get one. It required about that long to prepare a royal body for burial, and there was not likely to be any organized movement to unseat her before her husband's interment, a period of official mourning being the established program. One of her sisters had been married to an Asiatic prince, and it was to Asia she looked for help. She wrote to the king of the Hittites:

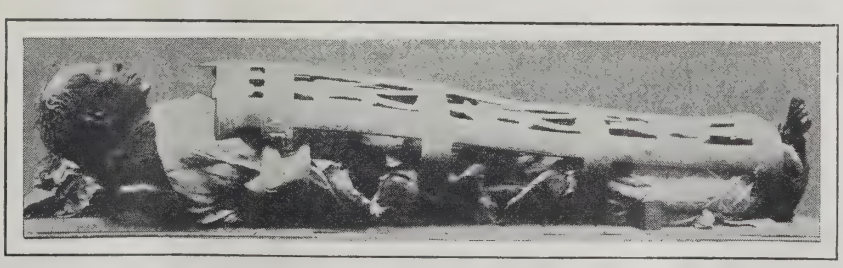


"My husband is dead, and I am told you have grown sons. Send me one of them, and I will make him my husband, and he shall be king of Egypt."

If only the king of the Hittites had been a little better informed on international affairs, he would have known that this was a great opportunity. If he had sent a son, backed up by a good strong military force, and they had arrived during the period of official mourning, there could have been a marriage, which the priests of Amon would gladly have sanctioned, and the funeral baked meats might freshly have furnished the wedding feast. But the Hittite king was cautious. He wrote asking whether the dead king did not have a son, who might assert his claim to the throne. The king of the Hittites did not wish to risk his own son against such a claimant. She wrote almost in despair: "Why should I deceive you? I have no son, and my husband is dead. Send me a son of yours, and I will make him king."

We do not know whether the Hittite prince started forth to win this girl-widow and her troubled kingdom. If he started, he probably turned back; but much time had been wasted, and she did not secure a royal husband. If she had succeeded, there never would have been a Rameses the Great.

Poor girl, she deserved a husband. I think if I had been the son of the Hittite king, I would have risked a throw of the dice of international relations in an effort to win that girl. Dedicated by her idealistic father to a cause already doomed, and committed by her girlhood marriage to a policy which her boy-husband could not make effective, she lived to offer her hand in marriage to a prince whose father dared not risk his darling boy on so questionable an adventure, and she had the double sorrow of a dead husband and an unrequited love. And all within sixty days. And then, as we judge, dethronement and political chaos. Poor girl, she did not deserve all this.



The daily papers remind us that we need not go so far up the Nile, 418 miles above Cairo, for matters of modern interest. I made the journey, but I also visited the site of the tomb, real or supposed, of Senefru, discovered by Professor George A. Reisner, of Harvard. Tut-ankh-amon reigned about 1350 B.C. But Senefru was the founder of the mighty dynasty that built the pyramids, and the pyramids were hoary with antiquity before Tut-ankh-amon ever became the son-in-law of a king. Senefru began to reign about 2750 B.C., and reigned for nearly a quarter of a century.

Colossal figures of Rameses II in the Temple of Luxor.

It is a most interesting fact that Professor James A. Breasted, of the University of Chicago, should have done the major part of the translating of the inscriptions on the tomb of Tut-ankh-amon with associate curator A.C. Mace and Harry Burton, of the Metropolitan Museum of Fine Arts in New York, in charge of the photography and other important matters there; and that a professor of Harvard should be working at the tomb of Senefru. America has a place in the sun when it comes to Oriental research, and when I say a place in the sun, I speak advisedly. We simply do not know what discoveries Professor Reisner may make.

Senefru was a mighty monarch. He built two pyramids. One of them, the earliest of all pyramids except the "step-pyramid" erected by his predecessor, Zoser, is a truncated affair rising in two steep slopes at Sakkarah, and the Arabs call it "the false pyramid." The other, not far away, is an imposing structure which rises in solitary grandeur and is almost as large as the great pyramid of Cheops. Did Senefru, having erected two such notable tombs, decide that they would not be safe from grave robbers, and that it would be better to provide a hidden tomb a few miles distant, and leave the pyramids as a camouflage? Or was he buried in one of them, and is the tomb, sealed with his royal seal, which Dr. Reisner has discovered, that of one of his high officials?

Mummy of Rameses II, on view in Cairo.

To return to Tut-ankh-amon, or rather to his father-in-law, Amenophis IV, or Ikhnaten, as he renamed himself. He tried to teach the world the worship of one God, the god of the life-giving sun. Let us not despise him because he knew of no god apart from some visible object. He almost saved Egypt to monotheism. As far as we know, he was the first king on earth who ever said, "This worship of many gods is wrong; there is but one God." Who taught him that? He did not think that out alone. Who taught him? Without much doubt, the priests of Heliopolis. They were jealous, no doubt, of the royal attention lavished on the temples of Amon, and they managed to convince the king that theirs was the one true God. Discount their motives all you like, but give them credit at least for so much of truth as they discovered, and it was not a small one.

Some time prior to this there had risen another man in Egypt, and his name was Joseph. Who were his associates and friends? The priests of On, one of whom was his father-in-law (*Genesis* 41:45). His wife, Asenath, came from On. Very likely his own home was there, certainly not far from there. On is the Bible name of the city which we know by its appropriate Greek name, Heliopolis—the city of the sun.

Moses was learned in all the learning of the Egyptians. Who instructed him? Beyond any reasonable doubt, the priests of Heliopolis, for he also lived in that Memphite region and under its influence.

## A Play Promoter

THIS is the story of a sort of educational pied-piper who isn't pied and who doesn't wear a long yellow cloak, yet who makes the eyes of some 9,000 boys and girls in Lexington, the capital of the Kentucky Blue Grass, dance with delight and excitement every time he appears.

For W. J. Sanford, Jr., plays the tune which for nearly five years has told boys and girls of sailboat races, kite tournaments, dog and pet shows, water carnivals, lantern carnivals, kid karnivals, field meets, doll shows and what not. If he has a motto or a golden text it must be this remark of his: "When one realizes how intimately the misuse of leisure time is associated with the faults and failures of society as a whole, any scheme that provides for healthful play and recreation, substitutes constructive for destructive interests, certainly deserves the support of the public."

A few facts regarding this man Sanford are pertinent. He has three jobs: truant officer, clerk for the county judge, supervisor of playgrounds. In addition, he plays the chimes every evening and calls it "taking my daily exercise."

Lexington has a Civic League which sponsors the work of Mr. Sanford. It, too, is a rather active body, for it conducts a neighborhood club, monthly dances, penny lunches, helps along the orphans' and children's home, encourages boys' clubs, has a county rest room, a day nursery, a colored dramatic institute, negro historical pageant, provides Christmas caroling, story hours, runs a daily clinic, furnishes Christmas trees, and through the playground work in summer reaches many thousands of persons —in a city of 40,000 population and 9,000 children.

The average daily attendance at the playgrounds is 2,263, which constitutes one-third of all the children under junior high school age, yet the total cost for the salaries of twelve white and three colored assistants is only $3,754 for the eleven weeks of summer.

At the playgrounds the children participate in handwork, story-telling, folk dancing, singing and group games for little children in the morning, and swimming, baseball, playground ball, quoits, checkers and chess in the afternoon.

Competition among playgrounds is stimulated by a baseball league, volley ball league, girls' volley ball teams, swimming meet, bird book contest, and a marble tournament.

In addition are other events:

The dog and pet show had 93 entries, ranging from wolf hounds and police dogs to pomeranians and dwarf spitz, while the 295 entries in the pet show included cats, rabbits, ponies, mice, terrapins, squirrels, a whistling canary, a monkey, snakes, a goat and a Canadian bear cub. More than 7,000 persons attended.

A doll show exhibited 138 dolls, one more than a century old, and this was attended by approximately 2,000 children and adults. The lantern carnival played before 1,500 persons to the tune of the Boy Scouts' Band. The toy boat contest was an event; grandfathers and infants watched the races and one small steamboat which caught fire had to be ducked under water. Kid karnival proved another big day and brought out 5,000 persons.

# A Dance A Week

### DURANG'S HORNPIPE

Six couples in each set.

Call first figure before music begins. First, third and fifth couples pass over.

| | |
|---|---|
| First lady balance to second gentleman | 4 bars |
| Swing partners | 4 bars |
| First gentleman balance to second lady | 4 bars |
| Swing partners | 4 bars |
| First couple down the center and back | 8 bars |
| Cast off, and right and left | 8 bars |

Repeat until all couples have gone through the movements, then call,—
All forward and back, turn partners, promenade to seats.

### FISHER'S HORNPIPE.

Metronome 112. Six couples.

Call the first change before the music begins.

Down the outside and back ..... 8 bars

Each turn outward, and walk eight steps to the foot of the set, and return, each back of their own line.

Down the center and back ..... 8 bars

The same couple cross hands, and promenade eight steps down the center to the foot of the set, turn, the hands still crossed, and return eight steps to the head, separate and cast off; going below one couple.

Six hands around ..... 8 bars

The first three couples on the head, join hands, and circle once around.

Right and left ..... 8 bars

The first two couples.

Repeat all.

The same couple will then repeat from the beginning, starting down the outside, from the position they are now in. Six hands around will be executed by the third and fourth couples, the couple now at the head remaining idle. Repeat, going below one couple each time until all have gone through the movement.

When the first couple begins the movement the fourth time, the couple standing at the head begins at the same time. When a couple arrives at the head or foot of the set, they wait during two repetitions of the movements.

### THE GIRL I LEFT BEHIND ME

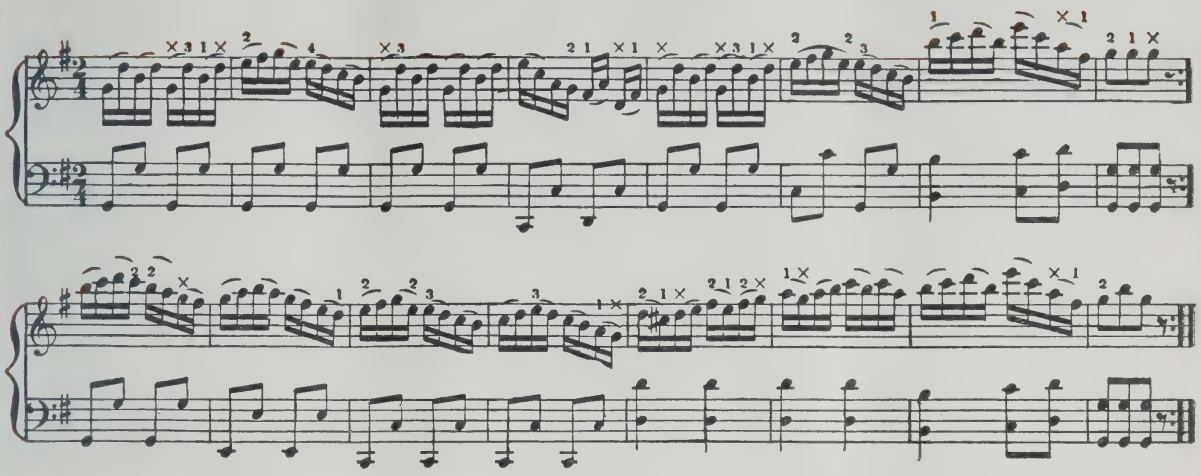
Six couples in a set.

The first couple exchange places, before the first call is given.

| | |
|---|---|
| First couple down the center with second lady | 4 bars |
| Leave lady at the foot, and return to place | 4 bars |
| Down the center with second gentleman | 4 bars |
| Return and leave gentleman at the foot | 4 bars |
| Head couple down the center | 4 bars |
| Both couples back to places | 4 bars |
| Right and left | 8 bars |

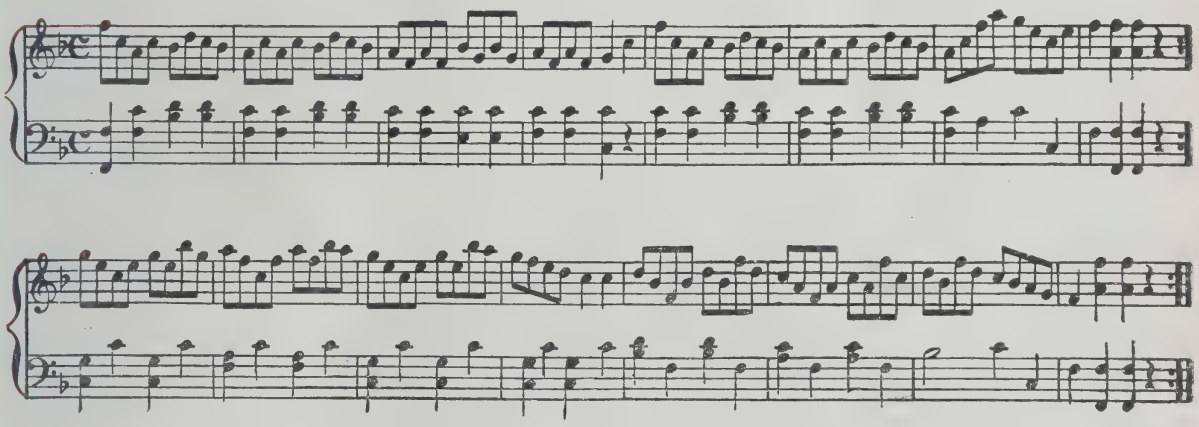
Cast off each time and repeat until all have gone through the movement.
Last call,—All join hands forward, turn partners, promenade to seats.

---



"Good Morning," a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.



Please order by number.

1. Grand Pa's Favorite
2. Sicilian Circle
3. Virginia Reel
4. Medley Waltz
5. Medley Two Step
6. Varsovienne
7. Rye Waltz
8. Oriental Lancers
9. Heel and Toe Polka
10. Old Southern Schottische
11. Money Musk
12. Badger Gavotte
13. Waltz No. 2
14. Ripple
15. Ticknor's Quadrille
16. My Queen Medley Waltz
17. Luxemburg Schottische
18. Sea Side Polka
19. Club Quadrille
20. Day Break Waltz

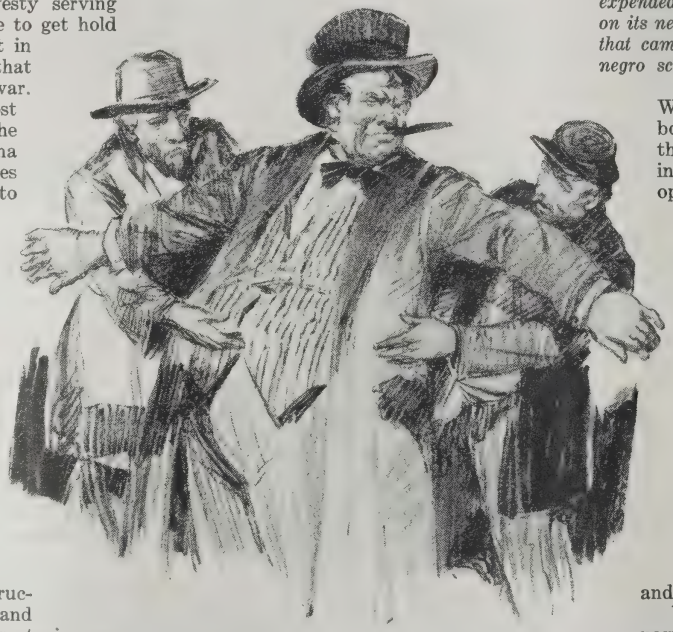
## The Girl I Left Behind Me

# Reconstruction and the Negro Race

(*Continued from page 7*)

a group of white people, a horde of professional politicians, grafters and adventurers flocked south and meddled in every phase of life, from exploiting the negro by selling him the painted pegs by which he could stake out for himself any forty acres of land that he might fancy, to visions of his filling governors' chairs. The Freedmen's bureau gathered the fuel and made ready the fires of race feeling in the South, but it was these "carpetbaggers" who applied the match and started the fires going throughout the land.

It was indicated that if the states would organize governments under these conditions they could escape military law. The white people asked for military law in preference to this negro-carpetbagger-scalawag régime. (The "scalawag" was the white person of the South who had taken no part in the war and later capitalized his disloyalty as patriotism for what it would net him in politics. The scalawag explains the South's early distaste for a white Republican, especially the native variety.)



As might have been expected, anarchy broke loose. Because communication was still suffering from the devastation of the war and because the South had few periodicals, little of the truth ever got before the world; even the various Southern communities knew none too well what went on in the others, but every community has its citizens, white and black, who lived through and took part in those awful days of crime and gruesome reprisal. Pillaging, rioting, rapine and murder swept over the land. The government was a travesty serving only to enable those in charge to get hold of public funds, and to extort in confiscatory taxes the little that had been saved from the war. Many a Southern family lost home and plantation for the taxes upon them. Louisiana went bankrupt; in other states staggering debts, destined to hamper progress for many years, were piled up by these mixed legislatures whose members paid little or nothing in taxes. Ninety members of a South Carolina legislature did not pay a cent in taxes. The entire membership of an Alabama legislature paid less than a hundred dollars in taxes.

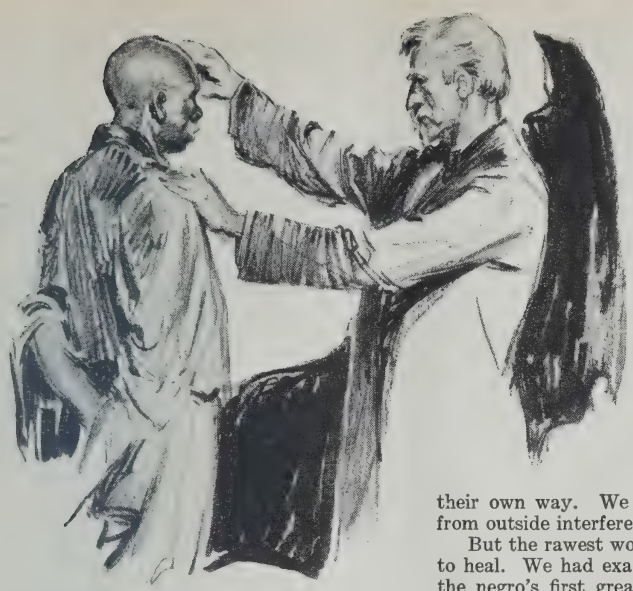
The white people realized that their country was sinking into barbarism; with the desperation of despair they fought the fire with fire. In many places they succeeded in obtaining control of elections by ignoring the Reconstruction Act of disfranchisement and stuffing ballot boxes or threatening or forcing the negro to relinquish political activities. This was comparatively easy in those states where the whites outnumbered the negroes, but in those states where the negroes were in majority, as in Louisiana, Mississippi, Alabama and South Carolina, the contest for power was long-drawn-out and bitter and often resulted in open clash of arms, as at Vicksburg and Clinton, Mississippi, and New Orleans.

That the negro was bluffed out of power in the South with a "Boo!" from a ghostly horseman is another popular fallacy; the ghostly horseman helped but he was not entirely sufficient. The negro contested stoutly for the ground he held, and it was 1879 before he and the carpetbagger were finally ousted and the white people in full control of the South. And it might have taken even longer had not the Liberals overthrown the Radicals in the North and begun to show a more sympathetic attitude toward the South. Then another thing worked in our favor: the nation seemed to be growing tired of worrying with its recalcitrant brother, the white Southerner and its stepbrother, the black Southerner, and more and more turned its attention to its own commercial and industrial activities.

Thus by 1880 the ex-master and the ex-slave were left together amidst the wreckage to do what they would with it and with each other. The rest of America, marching forward to its great industrial triumph—a march that the Civil War only accelerated by solidifying its people, teaching and perfecting organization and creating new industries—little realized what the war and the Reconstruction did to the South and have always been prone to attribute our "backwardness" to an inherent indolence and lack of ability. We had been flung down from the top of the commercial and financial ladder to the very bottom and were in a condition almost as primitive as that of the early pioneers.

The majority of Southern men and women who were of school age at the close of the war never got more than a few weeks or a few months of schooling in their entire lives; homes and farms were run down and impoverished; commercial, financial or industrial organizations whereby men usually pool their strength for mutual helpfulness were unknown; we were a section of debt-ridden individual farmers and hopeless, indifferent tenants. Cotton was the only thing produced universally that could find a ready market, but the human labor required for its production was so great, the price obtained for it so out of proportion to manufactured products, and the credit system under which it was grown so deadening that it kept the white people as well as the black in a state of virtual peonage to the supply merchant and the bank, and these in turn had to bow to outside capital. Many of the best families were reduced to the level of the "poor whites" and their women and girls became common field laborers. Few could afford good carriages and horses, and because of this there was an unfortunate tendency to stagnate in isolated communities, losing the ambition and initiative that contact with the world gives.

Often the work of the soldier on the battlefield is lost or nullified by the politician or seeker after special privilege.



But bit by bit we crawled out of our poverty and stagnation. Industries grew up and others came in, despite our reputation over America and Europe for being a backward section—a reputation the railroads did much to foster by diverting settlers and investors to the opening West. Farms were brought back to their normal productiveness. Diversification began to be practiced and a market for other things than cotton gradually built up. Schools expanded from the three-and four-month sessions of the eighties to excellent nine-month schools, and the financial condition of the people enabled them to keep their children in school for the full term instead of having to take them out to hoe and pick cotton as formerly. *By 1890 the South had expended more than a hundred million dollars on its negro schools alone and for every dollar that came in from philanthropic sources for negro schools the South paid ten in taxes.*

During the ten years preceding the World War the South had reached the boom stage. It became the thing for the Northern manufacturer to invest in the cheaper but equally good opportunities of the South and in addition be close to cheap labor. The Southern people themselves began to reach out into all sorts of enterprises, and while cotton was still king there were many lesser lights to bear him company.

With the passage of time and the improvement of conditions, bitterness and hate in the South gave way to a philosophical attitude and a mellowing of spirit. Perhaps after all we had been sorely trying to the North, who had also poured out blood and gold. We were glad that sectionalism was disappearing and we yearned for the North's friendship and understanding.

We ceased wholly to blame the negro for his part in the Reconstruction folly; he was ignorant and inexperienced and it was but natural that, like a harness-freed horse, he should want to stretch his muscles and kick up his heels a bit. His love for the trappings of power, his bungling with statesmanship, his profligacy with public money, were the intoxication of new experiences and the reaction from the restraint of slavery. These things we could forgive and forget.

But other things we could not forget. At the first opportunity to act on his own volition the negro showed a strong pro-

The negro was encouraged to help himself, and to believe that only an industrious, self-reliant race is worthy of respect.

pensity to listen to false teachings and to follow strange leaders; and he showed that it was in his heart to turn on the Southerner, who had done nothing to him but buy him off the markets of the world and teach him the fundamentals of civilization. These two things were not the errors of ignorance and inexperience, but were the heart and mind of the man speaking. They explain the disfranchised negro, the inflexible segregation, the "Solid South." They explain why the Southern people, through all those years of their cornbread-and-sorghum poverty, made no gesture of welcome to outsiders but battled alone with their terrific race problem, determined henceforth to handle it in their own way. We had suffered enough from outside interference.

But the rawest wounds have a tendency to heal. We had exacted a bitter price for the negro's first great error as a race, his part in the Reconstruction folly. He seemed to be thoroughly repentant and once the matter of who was boss in the South was settled, he followed us through all our ups and downs of poverty and slow progress. Much of the old master-and-man affection returned, the negro with all his faults belonged to us still; we with all of ours were still his "white folks"; he was one part of the South, we the other. Apparently the rest of America had ceased to be interested in either of us, so we were mutually dependent on each other.

Then we began to realize that no people can rise above the average level of its people, no matter what race or class constitutes that average; if we were to march upward we would have to take the negro with us or he would pull us down by the sheer weight of his ten millions. His schools were improved, his interests given earnest attention by church and civic organizations. He was encouraged to help himself, to think well of himself and to believe that only an industrious, self-reliant race is worthy of the respect of men.

An era of unprecedented tolerance and good feeling between the white and the black race set in. While that fine line of steel that ever lies between the paths of the two races was never forgotten, they were closer together, as man and man, than ever in their history. In get-together organizations all over the country the races were making sincere effort to understand each other and to arrive at satisfactory solutions of their many problems. The negro was winning back, and winning on a sound and lasting basis, many of the things the white race had had to take from him.

And that was the race situation in the South when the World War broke out.

*This is the second of a series of articles by Townsend Boyer. The next will appear in an early issue.*

# Australia—A White Man's Country

(*Concluded from page 15*)

production of gold, silver, lead, copper, iron, tin, zinc and coal.

As a manufacturing country Australia still has to come to the front, but it has made a start in many lines and is gradually increasing its manufactured products. Melbourne is the national leader in this respect and is developing along industrial lines while Sydney has forged to the front, because of its possession of the world's greatest harbor, as a shipping and commercial center. But manufacturing industries also are growing steadily in Sydney and in other centers.

Away from the cities is the "outback." Here are the farms and the "stations" that produce Australia's products. The "stations," similar to the old-time ranches in the American West, are enormous in extent and many of them are principalities in themselves, with vast herds of sheep and cattle grazing over their miles upon miles of grassy acreage. Just recently a "station" was sold at auction to settle an estate. It brought a million and three-quarters dollars at the sale. Statistics on its production showed that it had made a profit last year of nearly a quarter of a million dollars.

The people of Australia today are proud of their great commonwealth and confident of its brilliant future. Remote from the rest of the world they are not as hurried and as feverish in their business or their play as are the people of North America or Europe. They do not expect to develop their huge resources and open up their countless miles of new territory in a year or two. They are content to go along as they are and satisfied with present prosperity, but still are awake to the needs of the future and to the necessity of preparing for them.

The Australian is intensely loyal to the British Empire and to its ideals and traditions. British habits and customs prevail, but at the same time the Australian is independent and will permit no one else to govern him.

Government commissions and scientific investigators are at work in an effort to solve many great problems, some connected with the development of the country; others with the development of the nation. Oil and water are two great needs in physical development. Immigration and control of business development are two big governmental problems.

There is plenty of water in Australia at certain times in the year and a scarcity of it at other times. The rainfall is liberal, but much of it runs away too rapidly and great areas need irrigation as a result. This is a plain engineering problem. It is being met by the gradual extension of dams and reservoirs. As the country grows, an enormous amount of this engineering work will be needed.

Oil is being sought by experts. Oil men tell us that where there is coal there is oil and Australia has vast coal resources already discovered and probably many more that still are to be located. The finding of oil and its production will mean much for the growth of the commonwealth in the future.

Australian labor is largely in control of the government. Labor unions dictate laws and regulations and labor government dabbles in government ownership of all sorts of public utilities and lines of business. Capital, principally represented by owners of great estates and large stations, makes plenty of money and appears to be satisfied with conditions. There is no political cohesion of those opposed to the labor program of government, and the splitting of the opposition ranks into various party groups makes it easy for labor to win elections.

But no matter what group is in charge of the government, all Australians are interested in the subject of immigration, for upon this more than upon any other thing, depends the future of the country.

Australians are determined to keep this "a white man's country." The bars are up against Orientals and blacks. So deep-rooted is this feeling that prejudice rules against any swarthy skinned peoples. In the past few years there have been many Italians, Greeks, Syrians and other Mediterranean peoples come to Australia as immigrants. They have not been welcomed and steps are being taken to put up the bars against them.

Thus far most encouragement has been given to English immigration and there are many who would like to see the country filled up with the overflow of England's population. Gifts of land to English settlers are made, but there have been many instances of English settlers giving up the struggle against the land and coming into the cities to look for employment and companionship. The cities of Australia do not need increases without increased population and production inland.

The hardy pioneer is the need of the country and Australia wants to find him and plenty of him. Perhaps a commission may study the experiences of the United States in this respect. No nation in the world has had so much experience with immigration as has the United States of America and it has learned many lessons which might be profitable to Australia while she still stands on the threshold of her future.

# Building Houses by the Cubic Foot

## Cost of Your New Home Is Regulated by the Amount of Space You Wish to Have

By ALBERT WOOD

Interesting entrance feature in stucco.

MILK costs so much a quart, butter so much a pound, potatoes so much a peck, and generally speaking houses cost so much a "cubic foot."

A six-room house containing thirty thousand cubic feet might quite naturally cost more than an eight-room house containing twenty-five thousand cubic feet.

As far as costs are concerned, and that is the most important detail about house building for most of us, the question is not "how many rooms" but "how much space"; it is not so much a question of plan and arrangement as it is a question of floor area and cubic contents—bulk, in other words.

Something akin to necromancy will be needed if we are to produce a thirty-thousand-cubic-foot house out of a twenty-thousand-cubic-foot purse, and an early realization of this fact will help us to balance our building budget and control construction costs.

The floor area multiplied by the height of a room gives us the "cube"; and since the story heights in residences of moderate size are fairly constant, it may be easier to visualize the "cubic contents" in terms of square feet of floor area.

For example: A builder in the Middle West estimates that a two-story and full basement, well-built, steam-heated house, with adequate plumbing fixtures, may be built for four dollars and a half a square foot of floor area above the basement.

On this basis a house 40 feet wide and 30 feet in depth having an area of 1,200 square feet on the first floor and 1,200 square feet on the second floor would cost about $10,800. Or a house 28 x 24 on the same basis would cost in the neighborhood of $6,048. This, then, would be one answer to the question, "How much house for $6,000?"

In your locality, for various reasons, this price per square foot may not exactly apply; however, you will doubtless find some such general method of estimating houses of certain distinct types prevailing among your local architects, builders, or mortgage loan companies. With some it may be a cost-per-square-foot method; with others it may be a "cubic foot" unit of cost; but in any event, once you assume a unit of cost based on your desired class of construction, it is then the floor area and bulk of a house that largely determine the cost.

Many of us make a fundamental mistake in thinking we can add a foot or two to the dimensions of some otherwise desirable plan without affecting the cost much. For example, we may be quite satisfied with the 28′ x 24′ two-story house costing $6,048, "if only it could be made two feet larger each way—say 30′ x 26′." Using our pencil for just a moment, we find this apparently slight increase in dimensions has given us an area of 780 square feet on each floor and we may reasonably expect to see the cost advance to $7,020, or an increase of more than 15 per cent.

It is much like buying carpet by the yard, the cost depending entirely on the area covered and the price per yard.

These brief examples indicate the need for a thorough study of space requirements and the necessity for arranging this space to reduce waste areas to the minimum.

If you find your space requirements demand no less than 780 square feet on each floor, and your available funds not more than $6,000, you will discover that the cost of a home, to meet these conditions, must not exceed $3.85 a square foot. Thus when you consult your architect you will learn that this governing fact determines the type of construction, the kind of heating plant, the amount and quality of plumbing, and many other details about which you may have been undecided. In other words, the quality must be somewhat reduced from the standards you observed in the $4.50-a-square-foot house.

If, however, you place the $4.50 quality above everything else, you must be prepared to reduce the area to 675 square feet to keep within your $6,000 appropriation. Rather than reduce the size of all rooms until none remains really adequate, you may omit the dining room on the first floor and a guest room on the second floor.

Perhaps you have made a record of just how much each room is used and find that only one hour in twenty-four is spent in the dining room, and decide to retain the convenient breakfast nook happily combined with the kitchen, and rearrange one end of the living room for that one hour's daily dining use. With appropriate furniture this dining and living room combination may be most attractively planned.

Halls and stairways are extravagant space wasters unless very carefully planned. The early English house consisted of nothing more than a barn-like hall, with a kitchen at one end of the room. Later the kitchen end was extended as a service wing and at the opposite end of the great hall a wing was added for the owner's privacy. With the addition of a second floor a grand staircase was thought desirable and in time became the feature of many Elizabethan mansions. In these houses the servants were supplied with a private staircase.

These large mansions naturally set the style and as a result builders of small homes attempted to adopt similar features, at any cost, and regardless of the practical need. Recently, however, the extra servants' stairway has gone the way of the old-fashioned family servant and all but disappeared in the average home; and the great stair hall and staircase has been reduced until it is not the conspicuous feature of former days.

A stair hall and staircase, however, may be a beautiful, useful, and altogether delightful feature of a house without being either overlarge or conspicuous, as one of our illustrations indicates.

The careful, judicious selection of furniture is also an important factor not only in space conservation, but in the comfort, beauty and character it may add to a home. Everything that has been said relative to restraint, dignity, good taste, common sense, and comfort as to the construction of the house, may be applied to its furniture and decoration.

Returning again to the subject of costs, one of the first steps in the business of planning a house is to balance the size with the purse. It is not always the architect's or builder's fault that you cannot have your cake and eat it too.

The newer note in stair halls for the small house.

# Group of House Inspirations for Prospective Builders

Many of our most interesting and homelike places show marked Colonial influence.

A consistent and judicious combination of materials skillfully blended into a home of beauty, character and distinction.

Oval—In America today we are building some of the finest small homes in the world.

Below—A "homey" place after the English type.

A simple and picturesque composition.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

THE Americans are the first people whom Heaven has favored with an opportunity of deliberating upon, and choosing the forms of government under which they should live. All other constitutions have derived their existence from violence or accidental circumstances, and are therefore probably more distant from their perfection, which, though beyond our reach, may nevertheless be approached under the guidance of reason and experience . . . Every member of the State ought diligently to read and to study the constitution of his country, and teach the rising generation to be free. By knowing their rights, they will sooner perceive when they are violated, and be the better prepared to defend and assert them.

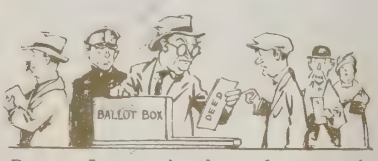
CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD



"THE CENSOR IS the salvation of the English stage. In America there is drama that would never for a moment be tolerated in England. Those who criticize the English censor have not watched things work as I have in a country where taste is led astray through there being no censor to blue-pencil rigorously the efforts of some dramatists."—*Cyril Maude.*

THE CITY OF LIMA, Peru, experiences an earthquake on an average of once a week, but during the past ten years there has been no loss of life or property.

A DENTIST'S DRILL of excellent workmanship was discovered in England during excavations on the site of an ancient Roman camp

A CRUDE WATER CLOCK, which has been in vogue in the Far East for 5,000 years, is still used by the Malays. A coconut shell with a small hole in the bottom is placed in a bucket of water. This slowly fills and sinks, measuring the time.

A WILY CHINESE general, during a recent engagement, placed firecrackers in an empty oil storage tank, with the hope that the enemy would believe he was heavily armed with machine guns. The bluff worked.

RHODE ISLAND is the only state in the Union where a man or woman has to have $34 worth of property in order to vote.

WATER IS SO CLEAR in the fiords of Norway that objects an inch-and-a-half in diameter can be distinctly seen at a depth of fifty feet.

AMERICANS CARRY approximately $55,000,000,000 in life insurance policies, and more than 150 persons have individual policies of a million dollars and more.

EIGHTY-SEVEN per cent of the energy used in this country is derived from coal, oil, and gas. Four per cent comes from water, and three per cent from working animals.

DETACHABLE COLLARS were invented in 1825, after a careful housewife had observed that the collar of a shirt became soiled more quickly than the shirt itself.

IN AN ATTEMPT to prove that cancer transfer from one human being to another is impossible, a German surgeon recently had himself inoculated with cancer tissue.

DURING THE WORLD WAR the percentages of population taken for military service were: Russia, 12 per cent; Austria-Hungary, 18 per cent; England, 18 per cent; Germany, 20 per cent; France, 20 per cent.

BY EQUIPPING lighthouses with perches the British Society for the protection of birds has reduced the destruction of birds confused by the light from nearly a thousand a night to fewer than that number a year.

A LOSS OF FOUR MILLION DOLLARS during the past year has been reported by the directors of the Krupp Works.

ONE OF THE EARLY American locomotives was propelled by joint legs that pressed or "kicked" against the ground in the rear. A speed of two-and-a-half miles was attained.

THE LARGEST LIBRARY in the world is the National Library at Paris. The Congressional Library at Washington is second largest. The British Museum Library in London has the most valuable collection.

WHEN A CHINESE host feels that guests have remained long enough he serves tea, a signal for departure.

A DIAMOND RING valued at $25,000, taken from the stomach of a large fish caught off the coast of Norway, has been turned over to the American Consul as probably one reported lost off Florida several years ago.

THE CONTINUOUS BEATING of waves against its base has caused Cape Henlopen lighthouse, built by the British in 1765 near Lewes, Delaware, to topple into the sea.

THE WORLD'S POPULATION is increasing at the rate of about twenty million a year.

THE BRITISH AIR MINISTRY plans to institute in the near future dirigible service between London and Calcutta. The journey is expected to take five days.

THE DEATH RAY was used by Archimedes in 300 B. C. at the battle of Syracuse when, by means of mirrors, he concentrated the sun's rays and burned the Roman galleys.

PENNIES ARE LEGAL tender only to the amount of twenty-five cents.

A UNIVERSITY OF CALIFORNIA co-ed narrowly escaped death when she insisted on living up to her promise to eat her hat when she lost a wager. The felt proved poisonous.

FIVE RARE COINS, bearing dates between 1738 and 1777, have been found in the woods near Oak Bluffs, Massachusetts. According to local tradition, two brothers buried their wealth there, fearful that it would be seized by advancing English troops.

MOTION PICTURE AUDIENCES look at a dark screen nearly half the time a film is being shown, and each one of the tiny pictures that make up the film is seen three times.

BUNGALOWS OF CAST IRON are being built in Glasgow, Scotland, to relieve the housing shortage.

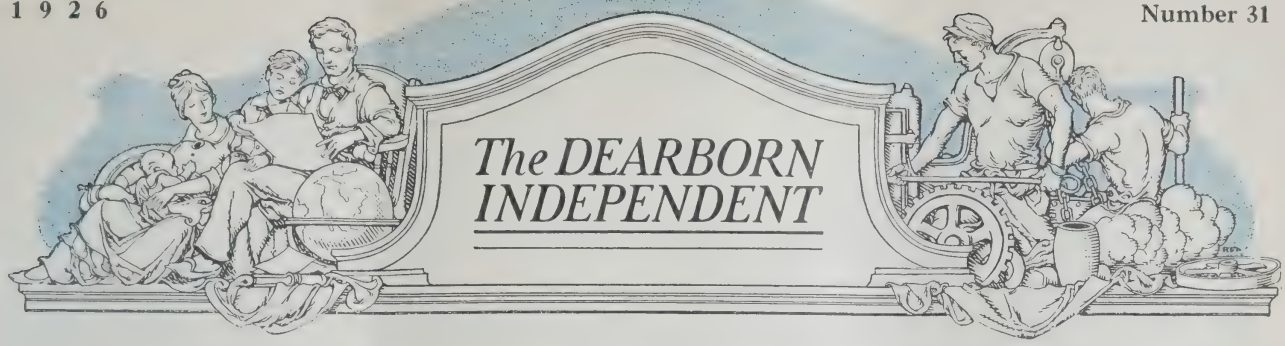
SIX CHILDREN IN Kansas protested to the probate judge that their mother was an unfit guardian for them because she bobbed her hair and wore gay clothing.

ONLY FIVE COLLEGE graduates are included in the 13,012 convicts in Sing Sing.

THE FIRST friction match was made in 1827 by John Walker, an English chemist.

A WATCHMAKER accidentally split a fine steel instrument just as he was about to sign a document. No quill being at hand he used the ruined tool. Thus came about the invention of the steel pen.

THE FEDERATED MALAY STATES produce 75 per cent of the world's tin and rubber.



THE BIGGEST MONUMENT in Soviet Russia will be erected in memory not of Lenin, but of Stenka Razin, bandit of the Robin Hood type, who died in 1671. The monument, carved in rock near Baku, will be two hundred feet in height and will be visible from ships sailing the Caspian Sea.

THE COLOGNE CATHEDRAL, built of soft sandstone, will have to be largely reconstructed because of vibrations from railroad traffic over the nearby Rhine bridge.

THE LONGEST TELEGRAPH line in the world is that between Liverpool and Teheran, capital of Persia. It is 4,290 miles in length.

# THE ESSENCE OF THIS ISSUE

MR. FORD'S PAGE this week deals with the folly of pretending to be better than you are, since as a matter of fact most folk are much better than they pretend.

Who pays for our radio programs? You and I don't—on the surface. We spin the dials, tune in on Pittsburgh or Davenport or Los Angeles, pay not a cent for the entertainment. *But somebody does.* There are 562 licensed broadcasting stations in this country. They represent an investment of $6,871,000. They spend annually a total of $5,981,000 in operation. Who bears this cost—and why? This article tells you. (p. 7)

Our policemen protect us. Who protects the policemen? No one, apparently! Scarcely a day passes but that we read in the newspapers of a policeman shot or killed by thugs. So commonplace have such reports become, in fact, that little attention is paid them. And little attention, likewise, is paid the subsequent court actions. (p. 3)

THE DEARBORN INDEPENDENT wanted to learn just how many policemen had been murdered in the past five years. No one had bothered to compile the statistics. So we got in direct touch with the police departments in a half-hundred cities. The results of our survey are given in this issue. They are astounding.

For two centuries and more, Salem Town has borne an unjust reputation as the center of the witchcraft trials. In reality *Salem Village*, now known as Danvers and some miles from the present Salem, was the scene of the scare. It was started by a parson's servant, half-negro, half-Indian, who taught voodoo tricks to children that gathered in her kitchen. (p. 2)

NEW YORK is a nice place—*to visit.* But what about living there? It has most ornate theaters, but average New Yorkers can't afford to go to them. It has restaurants most elaborate and most expensive. It boasts of being cosmopolitan, but in reality it is preponderantly alien! Here is a story by a Middle Westerner who tells *why he left New York.* (p. 5)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

WHY did President Wilson refuse to send General Wood to France? The inside story is now fully told by Huston Thompson, member of the Federal Trade Commission, and friend of Wilson. (p. 12)

Other interesting things are revealed: how the picketing of the White House by militant suffragettes affected Wilson . . . what finally won him to the cause of woman suffrage . . . *the memorable meeting between Roosevelt and Wilson at the outbreak of war* . . . why Wilson refused to seek vindication for his acts . . .

Hundreds of thousands of negroes, drawn by the lure of high wages, left the South for the North, never to return. How did this great exodus react upon the South? And how did the South regard the negro soldier, home from France? Townsend Boyer, writing from the viewpoint of the Southerner, answers both questions. (p. 15)

Captain Kidd was not a pirate! He was an officer of the Crown, a duly authorized and designated *pirate-catcher.* Thus does modern investigation shatter our childhood idols. May Whiting tells a delightful tale of the true William Kidd, son of a Scottish minister, whose greatest crime was hitting a mutinous sailor with an eight-pence bucket. (p. 8)

HAVE you ever slid down a mountain side at mile-a-minute speed? This is a story of Old Tim, snow-clad monarch of Utah, and a party that clambered to the summit one moonlit midnight. It sets the blood a-tingling with a sense of romance and adventure. (p. 18)

The West isn't all romance, however. There's a bitter side to it—dry-farming. True, enormous crops are produced, *but they come only once every six or seven years.* And the years in between are apt to be lean and hard. Only stout-spirited men and women, those willing to endure hardship and suffer privation, should undertake dry-farming. The article is by F. J. Clifford, a Westerner who knows the West. (p. 16)

Magellan first came into public notice through a scandal. His early years were insignificant and obscure. Then came a war with the Moors, and he still failed to distinguish himself, but he did manage to get into a scrape. But later his affairs took a turn for the better, and the great commercial house of De Haro became interested in his scheme to seek a way around the world. (p. 21)

THE cover this week is by Paul Honoré, who has illustrated many of Mr. Finger's stories. It shows Magellan and Faliero, student of astronomy and geography, studying a globe of the known world. Such globes had been devised only a few years before Magellan sailed. Mr. Honoré's picture has a wealth of color and detail. It will well repay close examination.

Many features will be contained in next week's issue . . . a story on Sean O'Casey and the famous Abbey Theater in Dublin . . . more information about the mysterious happenings in the Treasury Department . . . the tale of John Huggins, quaint barber king of Old New York.

SUBSCRIPTION PRICE $1.50 A YEAR in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies; other foreign countries, $2.00 a year.
SINGLE COPY, FIVE CENTS.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

# When Old Salem Hunted Witches

## Men and Women Were Put to Death on the Accusation of Little Children

By HENRIETTE BOECKMANN

WHAT is probably the most lamentable affair in all our American history, the slaughtering of human beings thought to have been witches in Salem, Massachusetts, more than two centuries ago, has been the means of bringing thousands of tourists yearly to the little city sitting on its bonny bay carved in picturesque outline. Yet the town to which by far the largest share of witchcraft interest really attaches, and at which the hideous affair had its commencement, is not Salem at all, but the little adjoining town of Danvers.

Farmhouse where lived Goodwife Nurse and her family until the witchcraft delusion broke out in Danvers, then known as Salem Village.

Sarah Osburn House.

Parris House.

While Salem in 1692, the year of the great witchcraft outbreak, was called Salem Town, Danvers, be it understood, went by the name of Salem Village. This use of the name "Salem Village" has always been confusing to later generations, and thus has it happened that one of New England's loveliest little towns, a town which lured Whittier to make his home there, has long lost its identity in connection with one of the most notable chapters in witchcraft history the world has known.

While in Salem I learned that close to 20,000 persons had visited that ancient edifice commonly called the Witch House the previous summer, and yet the best historians make it clear that the Court of Oyer and Terminer which tried the witches never sat there and that the whole interest linked with the house grew from the probable fact that complaints were made to Jonathan Corwin, who at one time lived there, and that warrants of arrest for persons accused of being witches were issued from this dilapidated old mansion, which has survived the centuries and that destroyer of the picturesque, Progress, at the corner of Essex and North streets. The witchcraft-curious wend their way to this gloomy old house that tradition alone has connected so prominently with innocent persons hanged as being by contract bound to Satan himself, while out on the undulating farm land of Danvers, miles distant in another direction, stands the large and lonely home of the most famous character thus put to death, the once happy home of Rebecca Nurse. In a small grove of pines on the farm is a handsome monument erected to the memory of this saintly, white-haired mother of eight children, a woman who was martyr to a splendid cause, for she persistently declined to attend any of the witchcraft meetings and consequently came under the suspicion of being one of Satan's cohorts.

John Greenleaf Whittier lived in Danvers at the time of the erection of the monument, and it was he who wrote the following expressive lines inscribed upon the stone:

"Oh Christian Martyr! who for truth could die,
When all about thee owned the hideous lie!
The world redeemed from Superstition's sway
Is breathing freer for thy sake today."

More persons accused of being witches or wizards lived in Danvers than in any other town, and a half of the twenty persons executed during this horrible hallucination had their homes in the village, whereas only two of the nine residents of Salem Town accused of dealing in witchcraft were hanged.

It was at the house of the minister of the parish now called Danvers that the mischief first began among a colored servant from the East Indies and a group of young girls. It was also at the church of this parish that most of the preliminary trials for examinations of the accused were held.

Of course, witchcraft cases broke out in other parts of New England, the first execution in the New World taking place at Charlestown in 1648. One fact that is almost always overlooked in reviewing the witchcraft tragedy is that *everyone* in those days believed witches existed, though there were those openly opposed to the manner in which the trials were conducted.

With all the fascination of an *Arabian Nights'* tale runs the beginning of the greatest drama of witchcraft conducted in this country. Undoubtedly it has its inception in the home of Reverend Samuel Parris, pastor of the church in what is now

(*Continued on page 27*)

Witch-house, so-called, in Salem, now partially hidden by a store. This dingy old place is visited by tourists, although the only witchcraft significance attached to it is that complaints against the witches were probably heard here by magistrates.

# The Man Who Fights Alone

## "The Cop Is the World's Greatest Warrior"; Can He Not Be Aided in His Fight With Criminals?

A SUB-GOVERNMENT has grown up within the boundaries of the United States and under the eyes of the people. Its members are chiefly of foreign birth or extraction. They hold themselves bound by no laws of the nation. They live by the knife, the gun and the bomb. They levy tribute on the citizenry, robbing, burning, slaying as they go. They have made of banditry a business, of murder a science.

There is small room for doubt that in America today a league of crime exists, and exacts heavy tribute from the people. Crime today is on a definite, calculated, business basis. It is highly organized. Risk is reduced to a minimum. From their metropolitan strongholds the allied criminals sally forth to prey upon the land.

No principles of honor or sportsmanship hamper them; they give no fighting chance. It is not "your money or your life," but your life and then your money Only in newspaper headlines does the bold, daring bandit exist. In actuality he is likely to be an underdeveloped neurotic whose "courage" springs from the knowledge that he has the drop on his victim. The Robin Hood and Jesse James types of criminal are unknown among the doped. cowardly killers who constitute the modern criminal classes.

Arrayed against these outlaws are the policemen of America.

They give us the best protection they can. We—as citizens, jurors, judges—give them practically none. We are less anxious, indeed, about safeguarding our policemen than we are about safeguarding the various legal quirks and technicalities that protect our criminals.

THE DEARBORN INDEPENDENT has compiled statistics, from fifty-two cities of a population of more than 100,000, on the number of policemen slain in line of duty during the past five years, and on the punishment meted to their murderers. The figures do not represent all the murders committed upon law officers, but are sufficiently astounding.

**Two hundred and fifty-six policemen have been killed in the fifty-two cities during this period.**

**Only twenty-six of their murderers have been hanged.**

**One hundred and twenty-one were sentenced to twenty years or more in prison.**

**Twenty-nine were sentenced to less than twenty years.**

"He must fight without hope of quarter or of mercy."

**Ninety-six of them (or 33 per cent) were promptly acquitted or freed under the other due processes of law.**

**Sixteen cases are still pending.**

**In fifty-six of the crimes (or 22 per cent) no arrests whatever were made.**

Statistics like these are the criminal's batting average, his box score. He knows the percentage of risk as well as he knows his own aliases.

He knows:

That only one criminal is hanged for every ten policemen murdered;

That his chances are one in five of not being arrested at all;

That if, perchance, he is caught, his chances are still one in three of getting off scot-free.

And what if he is sentenced to prison? Are there not parole boards? And are not professional criminals more often paroled than unfortunate men whose crimes consist of a single misstep?

Suppose we first consider Chicago. During the years 1921 to 1925, inclusive, forty policemen were slain in Chicago.

Only three men, all negroes, were hanged.

In ten cases the murderers were never apprehended; in eleven others the suspects were freed for divers reasons.

Of the forty-nine men arrested in connection with the killings, thirty-one were subsequently turned loose by the courts.

Ten men were sentenced to more than twenty years in prison, two to less than twenty years, and one case at this writing is still pending.*

Observers account for Chicago acquittals by saying that jurors have been taught, by speedy reprisal at the hands of friends of the accused, not to vote too often for conviction.

When 63 per cent, or nearly two-thirds, of all persons arrested for the slaying of policemen are turned loose in court it is a sign that something is wrong—with the police or with the courts. It means either that the police are arresting two *innocent* persons out

* In connection with these statistics it should be noted that one man was sentenced to be hanged but escaped from the county jail before the date of execution. In another case Bernard Grant and Walter Krauser were found guilty of the murder of a policeman and sentenced to death. They appealed and Grant's sentence was affirmed and Krauser's reversed. On June 22, 1925, Krauser killed Grant in the county jail, whereupon he was sentenced to Joliet Penitentiary for life.

of three, or that the courts are freeing two *guilty* persons out of three.

What type are these men who are caught up by the law, tried, and turned loose as innocent?* Here are some typical cases.

Patrolman Lawrence C. Harnett was shot and instantly killed in a West Polk Street house that he, Sergeant Barry and Patrolman Fuerst were raiding, in search of an alleged moonshine plant. Sergeant Barry was wounded. The inmates of the house, Italians, all of whom were accused of resisting the policemen, were indicted by the grand jury. All were acquitted.

Patrolman William F. Bunda was fatally shot on a street corner when he attempted to search three men for weapons, after he had discovered them pursuing a man through an alley. John Pettitto, John Simonetti and James Vitaliano (who was wounded by Bunda) were held to the grand jury by the coroner's jury. The grand jury indicted Pettitto and returned "not true bills" in the cases of Simonetti and Vitaliano. Pettitto was acquitted.

Patrolman Michael Murtaugh was shot to death by three bandits who were escaping after robbing a store. George Stoklasa was arrested, identified as one of the men, and indicted. He was acquitted.

Patrolman James Harrington was fatally injured when he was thrown over a railing from the third to the main floor by men who resented his attempt to stop a dance. Phillip Ottava, Attiloi Puccinelli, Sittimo Ginnetti and Eugene Cesaratti were arrested, indicted and acquitted.

And so on, and so on.

In 1925 four murderers of policemen were killed by the return fire of their victims, or the latter's companions. During the five-year period ten men were thus accounted for.

Just one more fact about Chicago. Of the forty cases in which Chicago policemen have been slain, the culprits in twenty-one, or more than half, have never been punished. *The Chicago murderer knows that if he slays a policeman, the chances are fifty-fifty that he will either escape arrest or will be freed in the courts!*

That, then, is the situation in Chicago! What of New York with its vast foreign population? Here is New York's record, furnished by Chief Inspector Lahey of the police department:

Twenty-four policemen slain in line of duty during the five-year period.

Nineteen persons arrested for homicide.

Ten of these freed by magistrates, county, or supreme court judges.

Four sentenced to death; two sentenced to life imprisonment; one sentenced to a lesser term; and two adjudged insane.

Two murderers slain by the police.

Seven persons punished by courts and two sent to insane asylums for the murder of twenty-four policemen. Comment is unnecessary.

For the sake of comparison let us consider some cities where the percentage of foreign population is not so high. Three Portland, Oregon, policemen were killed in the five-year period. Two of the murderers were hanged and the third was sentenced to life imprisonment. Four officers were slain at Washington, D. C. Six men were convicted and sent to prison, and another was killed by the policeman he had fatally wounded. In Richmond, Virginia, three murders occurred. Two of the slayers were sentenced to the electric chair and the third was acquitted. Five Salt Lake City policemen were slain, two of them by the same man, who committed suicide before capture. Of the remaining three murderers, two were executed by the state, and the third was killed by arresting officers.

Take almost any city at random. Where the native-born population is highest, murders are fewer with more frequent convictions. Professional criminals avoid those cities where juries cannot be deflected from their duty.

The attitude of the jury is directly reflected in the number of murders in any given city. In 1925 (according to statistics of the Prudential Life Insurance Company) Chicago led all other American cities with a total of 563 homicides. Manhattan was second with 375, and Detroit third with 243. All three cities are great centers of foreign-born population.

An interesting situation exists in Kansas City, where the motto, "No Work for the Jury," was adopted some time ago. Between 1920 and 1924 eleven policemen were killed there. *Not one case reached the courts!* In three instances the murderers were not apprehended. In the remainder the slayers were either killed by the return fire of their victims, or were killed by other policemen "while resisting arrest." *It is worthy of note that no Kansas City policemen were killed during 1925.*

One natural result of the failure of courts to convict has been that the police—and citizens as well—have begun to take the law into their own hands. In Chicago a bank reward of $2,500 is offered for a dead bandit, and only $1,000 for a live one.

Middle Western states have organized protective bodies to combat robbers who roam the highways in automobiles, looting small-town banks and stores. Iowa bankers a few years ago placed 2,289 pistols, 1,200 rifles, 240 riot guns and thousands of rounds of ammunition into the hands of some four thousand vigilantes. *The result was that the number of bank robberies dropped from fifty-six to six in four years, the total loss from $250,000 to $2,500—**and eighty out of eighty-nine bandits either were killed or went to prison!***

Bank insurance rates, which had been steadily mounting, started to tumble. Illinois, Indiana, Wisconsin, Minnesota, Kansas, Missouri and other states have adopted the "Iowa idea." Robberies are decreasing.

But open warfare between crime and authority is increasing. Gun battles between criminals and policemen are almost daily occurrences, especially in the larger cities. The appalling murder rate in America (11.1 per 100,000 in 1925—almost equal to that of Italy) brings forcibly to attention that perennial question: What's to be done? Policemen trying to check the growing monster, crime, are slaughtered like sheep while we stand supinely by.

One thing is sure: Court reform is essential. More convictions must be had. Sentiment for the criminal has no place in the present situation. War is on, and the rules of war must govern. If organized crime will not abide by the laws of the nation, then crime must be wiped out by stringent methods. More hangings, more (Concluded on page 24)

## List of Policemen Killed.

Here is the number of policemen slain in line of duty in fifty-two cities of a population of more than 100,000, during the past five years:

| | | | |
|---|---|---|---|
| Albany | 0 | Nashville | 6 |
| Atlanta | 4 | New Orleans | 6 |
| Boston | 5 | New York | 24 |
| Buffalo | 5 | Norfolk | 1 |
| Chicago | 40 | Oakland | 1 |
| Cincinnati | 6 | Oklahoma City | 3 |
| Cleveland | 5 | Omaha | 3 |
| Columbus | 4 | Philadelphia | 9 |
| Dallas | 3 | Pittsburgh | 3 |
| Denver | 2 | Portland, Ore. | 3 |
| Detroit | 18 | Providence | 0 |
| Duluth | 0 | Reading | 1 |
| Elizabeth | 0 | Richmond | 3 |
| El Paso | 6 | Rochester | 1 |
| Flint | 2 | St. Louis | 22 |
| Fort Worth | 3 | St. Paul | 3 |
| Grand Rapids | 2 | Salt Lake City | 5 |
| Hartford | 0 | San Diego | 0 |
| Houston | 3 | San Francisco | 6 |
| Indianapolis | 3 | Scranton | 0 |
| Jacksonville | 1 | Tacoma | 0 |
| Kansas City | 11 | Tulsa | 2 |
| Los Angeles | 12 | Washington | 4 |
| Louisville | 1 | Wilmington | 1 |
| Memphis | 6 | Youngstown | 2 |
| Milwaukee | 2 | | |
| Minneapolis | 3 | | 256 |

* In justice to the authorities it should be stated that the slaying of Patrolman William A. Perrin in November, 1924, was apparently accidental. A motorist, mistaking the policemen for robbers, opened fire, killing Perrin, and wounding Patrolmen Van Booven and Warburten. The other thirty-nine deaths come under the head of homicide.

# Why I Left New York

## A Middle Westerner Goes to Live in Manhattan and Does Not Feel at Home There; the Reason, He Realizes, Is That He Is in Conflict With Its Alien Atmosphere

By
L. L. ARMS

*PART ONE*

ILLUSTRATED BY
W. W. CLARKE

I LEFT New York not at all sure I should not soon go back. That was two years ago. Now I know if I can help it I shall never again live there. Some of my relatives still do, and believe I am a nut. I don't, and I think they are. It is apparent that as a place to call "home," New York can awaken differences of opinion.

Occasionally my relatives come out our way. They think the swimming great, the scenery incomparable, and the golf fine. I know they are frequently bowled over by the everyday courtesy at our resort hotel and among the townspeople. They have a suspicion they are being kidded. That, to my mind, is the ironic thrust at Father Knickerbocker.

"But what do you do for theaters?" they ask at length.

My relatives are that kind. That is to say, they are like thousands of other Middle Westerners living in New York who rush up the theaters to New York's defense whenever they feel defense is necessary.

"You can't see a first-rate show outside New York," they add owlishly.

The first is the New Yorker's left to the jaw, the second the right to the body. At this point some hundred million others of us are supposed to be carried out of the ring.

I know there is some truth to this theater claim. But somehow it leaves me cold. After ten years of New York —and New York's theaters—I am tempted to answer:

"Toward the New York theaters I feel the same as toward other of its widely advertised institutions. *Its theaters are the finest and the most unpleasant to get seats to, just as its subways are the fastest and most uncomfortable, its apartment houses and hotels the most pretentious and least human, its public parks the most expensive and depressing.*

New York, my dear relatives, is a vast agglomeration of inconvenient modern conveniences. For very good reasons it has lost the homely touch which is bred in the bone of things Middle Western and without which all else is nothing to the average Middle Westerner."

That of course would be the precise moment at which my relatives would think me a nut.

But at any rate New York was an early ambition of mine. While still in high school in the Middle West an older brother of one of my friends came home for the holidays. He had been graduated from our state university and had gone to New York to practise law. To me he was what would be known in the parlance of 47th Street and Seventh Avenue as a *wow*. His clothes, his speech, his manner, even the way he parted his hair, were different.

I was struck dumb before this exquisitely poised and authentic magnificence. When he spoke casually of reaching his office via a local and subway express, then by cross-town surface car, I felt I was listening to the extreme limit in human sophistication. When he lightly mentioned Coney Island I felt myself swaying as though in a dream. I should gladly have started walking to New York that evening.

Instead I finished high school,

I lived at a small hotel near Washington Square. The lone window opened upon a view of groups of soiled and chattering children.

I discovered that to take a woman to dinner, then to a popular musical show and afterward to a night club, with a corsage, cabs and tips, could easily nick me for two-thirds of a week's salary.

went to the state university and then to Los Angeles. That was before the City of Angels began its delirious boom. In those days a tire salesman was quite a boy and the citizenry was inclined to the belief that there was something seriously the matter with those quaint persons who darted here and there making motion pictures.

But even in Los Angeles, with opportunity banging at myself and three hundred thousand others, New York was in my blood. One day, alone, I began what turned out to be a 5,000-mile Odyssey with frequent stops and more frequent jolts. But I arrived, at last, in New York and sat down in a cross-town surface car.

A cross-town surface car! It was the first time I ever had ridden in one named that. Yet I had traveled in street-cars all my life. On this surface car there were a motorman and a conductor, both obviously foreign. Was it, after all, a matter of terminology? I felt vaguely disappointed. Looking back, that cross-town surface car seems symbolic.

I first lived at a small hotel near Washington Square. On second thought the hotel was not so small but my room was. I had never lived in one like it. A rickety bed, a chair and a cheap dresser comprised the appointments. It was necessary to go down a narrow, drafty hallway to reach a clammy, inadequate shower. The lone window opened upon a side street. As for view, my lasting memory will be that of squirming groups of soiled and chattering Italian children.

The New York correspondent I had met in Mexico during the second Madero revolution had recommended this hotel. He said it had atmosphere. Somewhere in a tower nearby a popular novelist pounded out best sellers. Poets, painters and journalists lived near the Square or its fringe. I should have the opportunity to study odd types.

While I never saw the novelist who wrote in the tower, it was true that, living near the Square, one came upon interesting looking persons. Yet not so frequently, nor so interesting, as I had expected. I remember that young women with their hair bobbed and wearing sandals struck me as unusual. At that time they were. Yet no one who had ever been on the campus of a co-educational university would have found the young ladies and gentlemen of Washington Square and Greenwich Village uncommonly pictorial. And it seemed to me, after some excursioning, that the putative mental freedom was little more than a thin cloak which poorly concealed very human predilections of sex and gossip.

I thought the intellectual life of Washington Square was greatly exaggerated. Occasionally a play, a verse, a painting was turned out which possessed some merit. *For the most part the aim was notoriety.* By using art as a deliberate insult to some time-proved convention this was easily achieved. Yet such insurgency was simple formula.

Washington Square was more in its element gossiping in its theatric cafés or dancing at its fantastic balls than in discussing Marcel Proust or James Branch Cabell. A good time was the primary desideratum in Washington Square. In later years I found the Greenwich Village hoe-downs were overrun by garment workers from the Bronx. And even before I left New York, because of misleading labels having to do with various forms of freedom and the great advantages therewith, Greenwich Village had defeated itself as a place to live cheaply.

But the reason I found Washington Square disappointing was not because of the posers in it or the things they did. It seemed to me this was all harmless enough. It was rather because Washington Square was undeniably dirty and because nine-tenths of the persons in it were not the kind of Americans your Middle Westerner is accustomed to. They were preponderantly Mediterranean or Semitic. They were different in speech, manners and dress. In Mexico I had found this diverting. In my own country it seemed something to ponder.

Years later I was to visit London and to feel more at home in its streets and among its people than I ever had felt in New York. And I knew precisely why.

The grandfather or great-grandfather of your average Middle Westerner came from New England or had some root there. He brought with him the customs and prejudices handed down by his forefathers. These unwritten codes and rules of conduct were handed on to his descendants. Thus at grammar or high school, or the state university, the Middle Westerner found himself thrown with young persons whose home training in the matter of morals and manners, not to mention hygiene, had been the same as his own.

His grandmother, his aunt, his mother, his dancing teacher combined to impress upon him the desirability of politeness and cleanliness. From a rugged grandfather and a watchful father he learned the necessity of courage and honesty. His grandfather, perhaps, had won a log-rolling contest in the north woods of Michigan against odds that were never diminished in the telling. An acquaintance of his father had had some serious trouble at the bank which was spoken of at home in hushed tones. The lessons of adolescence set up definite ideals. They created a moral and physical consciousness.

Though he prob- (Continued on page 31)

# Who Pays for Our Radio Programs?

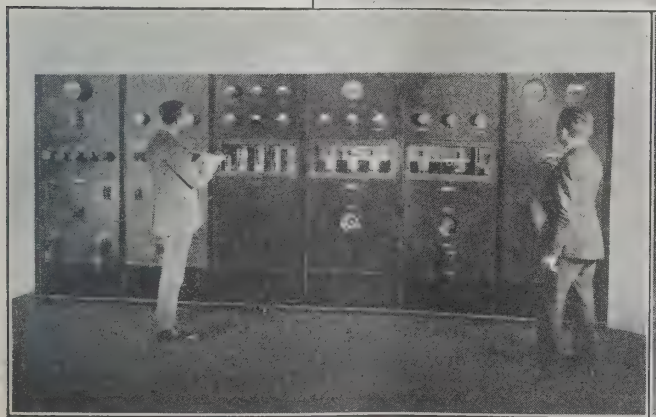
## National Advertisers Foot the Bill So We Can Listen-In Without Charge

By CHARLES A. COLLMAN

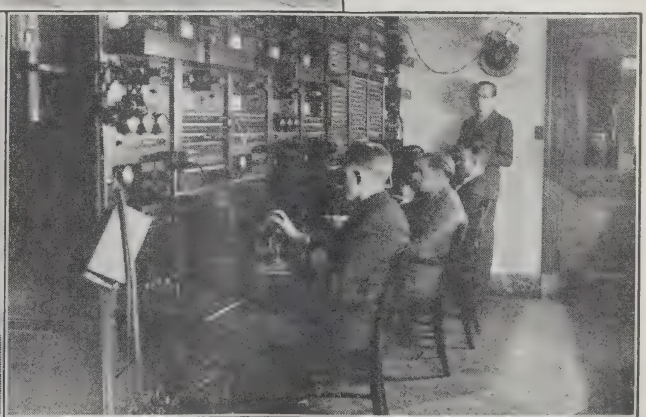
THERE are in the United States at the present time 562 radio broadcasting stations licensed by the Government and independently owned and operated. Their ownership is of the most varied description, and the programs with which they entertain their public are calculated to appeal to all tastes and inclinations, from grand-opera selections and philharmonic concerts to football games, pugilistic bouts and the comic effusions of "Dusty Twins" or "Jollity Boys." Millions of dollars have been invested in the broadcasting stations, which are expending further millions in putting on their programs.

While many stations are getting into commercial work by broadcasting for business concerns at so much an hour, others are ostensibly conducted as pure philanthropy. The great public that listens to this aerial entertainment pays nobody an admission fee.

How, then, is this great industry carried on, and who stands the expense? It may be taken for granted at the outset that publicity is the fundamental object of all broadcasting as now conducted, and the seekers after publicity foot the bill.



Some stations, for instance, are managed by police and fire departments for the purpose of boosting ambitious communities; others by department stores for the sake of the advertising, pure and simple. Of the 562 stations now in existence, 159 are managed by educational institutions, churches and Young Men's Christian Associations; 149 are run by radio companies, manufacturers, retailers or jobbers of radio sets; 49 by electric, automobile, hardware, battery and plumbing companies; 40 by department, jewelry and miscellaneous stores; 40 by newspapers and publishing and book concerns; 19 by theaters, motion picture and other amusement places; 17 by private individuals; 17 by Government, state or municipal bodies; 16 by banks, brokers, realtors and insurance companies; 11 by public utility, telephone, telegraph, light, heat and power companies and railroads; seven by poultry, livestock and grain concerns; three by hospitals, medical and drug companies; three by mining and oil corporations, and one by a laundry.



A recent survey made of the 562 stations throughout the country shows that, on the basis of returns obtained from the stations themselves, they have a total investment of $6,871,000 in plant, broadcasting equipment and studios, and they are spending annually a total of $5,981,000 in operation. Their income does not for a moment compare with their expenditures, although indirect benefits are included in the figures.

The peculiar status of the industry was indicated by a prominent official of one of the leading broadcasting stations. "Although," he said, "radio broadcasting has been in practical operation for the last three or four years—ever since, in fact, the Westinghouse Company established its station in Pittsburgh and put out the first experimental program—the art, as it may be called, is still a new one. Nobody has as yet devised a sound financial structure for it, and we're just drifting along. The thing really grew out of the war, when all the companies threw their patents wide open to the Government; and after the war they were requested to learn whether they couldn't develop radio operation without the intrusion of foreign influence.

"Just get a picture of the economic standpoint of the industry. There are 5,000,000 receiving sets in use in the United States, and these are the recipients of the radio-broadcast programs. Here's (Continued on page 23)

# Captain Kidd—Pirate-Catcher

"As they sail'd"—cruising privateers of the early 18th Century.

## The Rover Appears in a New Role: He Is Commissioned to Capture Ships Flying the Black Flag

By MAY B. WHITING

ILLUSTRATED BY PAUL FRANKLIN SEAVEY

IF ANY one doubts the efficacy of advertising, let him learn of Captain Kidd. According to popular tradition, he is the most bloodthirsty villain that ever flew the Jolly Roger, reeking with ill-gotten wealth which he distributed from Florida to Labrador, and at the close of a rollicking career meeting the fate he deserved at a rope's end between the ebb and flow of the tide. And what was he really? As a pirate, not even a third-rater. Boston hanged a dozen better men. Compare him with a few of those rovers who "sailed on the account," as the saying was, and see how he shows up.

As to appearance, there is never a word to show that Kidd was anything but an ordinary mortal, while Teach, or Blackbeard, let his beard grow so that scarcely more than his eyes showed, divided it into pigtails which he tied with ribbons behind his ears, and stuck slow matches into them when he went into combat. Kidd never even dressed the part that story has assigned him. Captain Roberts wore, when apprehended, as any self-respecting pirate should, "a rich damask waistcoat and breeches, a red feather in his hat, a gold chain about his neck with a diamond cross hanging to it, a sword in his hand, and two pairs of pistols hanging at the end of a silk sling flung over his shoulder."

William Kidd was the son of a Scottish clergyman and we have no reason to doubt the exemplary conduct of his youth. Certainly in young manhood he served his country well. Ned Low, on the contrary, passed his childhood riding around in a hamper on the shoulders of an elder brother and snatching hats and wigs from the passers-by, so that it became the fashion in Bristol to wear headgear tied under the chin.

As for achievement, James Morgan sacked Panama and was knighted for it, and Avery captured a vessel that was carrying a daughter of the Grand Mogul on a pilgrimage to Mecca, with bales of rich goods, gold, diamonds, rubies, and many things that a pirate could use. All that we are sure that Kidd stole is some Guinea corn to provision his ship. When it comes to barbarous cruelty, Kidd hit a mutinous gunner over the head with a wooden bucket (value eight pence) while Morgan used the rack with gusto, and Lollonais thought nothing of cutting the heart out of a suspiciously virtuous looking captive as a warning to those standing by.

Then, too, Kidd was a respectable married man with a wife of substance in New York, while on the Island of Madagascar there was a settlement of pirates with an assortment of wives of every color according as the favoring winds blew a vessel within their clutches. All the treasure that Kidd ever buried Lord Bellamont, governor of the province, promptly dug up. No large salvage was ever known to have been made and quite likely there are Spanish doubloons beneath the sands of the bar.

This is, indeed, an age of disillusionment. Our saints have mostly had their halos lifted from their brows and now our villains can scarcely rest in peace.

Captain Kidd burying treasure on Gardiner's Island

In King William's war Captain Kidd commanded a privateer and was known as a capable and adventurous servant of His Majesty. He also won distinction in the colonies, so that the General Assembly of New York voted that "Captain Kidd, for his many good services rendered the province, deserves to be suitably rewarded." The line between privateering and piracy was rather thin, but surely in his early career Kidd never slipped over the edge. But there were plenty of pirates afloat who claimed no other vocation, many of them rich, with fleets of vessels, and living, when ashore, in fortified colonies.

It seems to have occurred to Lord Bellamont, newly appointed governor of the province, that suppressing crime might be put on a financial basis, and he laid his plan before Kidd, then a prosperous captain nearing sixty, who, in the summer of 1695, chanced to be in London with one Livingston, a wealthy citizen of New York. Associated with Bellamont were Lord Somers, the Lord Chancellor, the (Concluded on page 25)

# MR. FORD'S PAGE

ONE of the great gifts conferred on man is his ability to project scenes and circumstances which, so far as he knows, never existed on land or sea, and to set himself as hero in their midst. The gift of imagination, of imaging forth the substance of faith or desire, emancipates man from every prison; with this magic gift he is forever free.

Most of the things we dream come true in one way or another; 'of what a man desires in his youth he shall have more than enough in his age.' But it is a pity that dreams become so unrecognizable when incarnated in what we call reality. Half the light of life is lost when we cannot see in familiar things the very visions we beheld in high moments of imagination.

Like other gifts, imagination has its counterfeits. The make-believe of children may become hypocrisy in the adult. 'Let us pretend,' that gateway to childhood's innocent joys, may in the adult become 'let us deceive.' The vision of the seer is mimicked in the fabrication of the faker. Except where mental insufficiency is the cause, there is always an invisible moral boundary where high and fruitful imaginative activity becomes deception and hypocrisy. The distinction between them is soon stated: the former is entirely concerned with the vision; the latter with self and its possible victims.

The commonest form of counterfeit is found in the desire to be thought something different from what one really is. There is a great deal of this kind of pretense in human life. It takes various forms; sometimes it rises out of pride, often out of shame—for pride and shame are close of kin. Some wish to be thought better than they are—a deception easily understood; others wish to be thought worse than they are—not hard to understand either. The 'front,' as it is called in modern slang, gives people much trouble; it must be 'kept up.' And so we find multitudes living, not by their own rule, but by what they think others think, though they have no sure way of knowing what others may think. This class of persons comes nearer being slaves than any other class our country contains.

Most regrettable of all the aspects of this foolish pretense is that *it does not improve the original.* The natural character of a person is usually so much more attractive than the character he assumes, that his mask achieves the opposite impression of what he desires. Reality must always have an advantage over pretense, and uncouth originality is more impressive than mediocre artifice.

This, of course, is known everywhere to people of common sense. At least it would seem that natural intelligence should be sufficient to enable anyone to see that nature cannot be disguised. What a man is will proclaim itself however great the pains he may take to conceal it. When every exterior art has been practised to perfection, there is still the subtle announcement of character itself which the honest beholder subtly perceives. This is nature's last revenge; its power to communicate its essence transcends all our efforts at suppression.

> *THOSE who try to appear what they are not would make a better appearance by being what they are. Most people who try to appear better than they are, are really better than they appear to be—if they only had common sense enough to know it. No amount of pretense can improve on the original. What a man is proclaims itself no matter how he tries to conceal it. Character subtly makes itself known through every disguise; and this is a very comforting fact, since the character is usually so much better than the caricature. Be yourself. It will not be a comedown from your pretense; it will be an ascent into original freedom.*

Hypocrisy does not always spring from bad motives. People want to seem better than they are because for the most part they wish they were better than they are. Comparatively few assume virtues they do not possess for the purpose of wronging their fellows; most do so for the purpose of winning respect.

What they need is another approach, the approach of common sense. Let them be what they are. In the great majority of cases what they really are is much better, more truly virtuous, than what they would seem to be. To be what one is, is regal. To be what one is, without apology, is freedom. To be what one is, eagerly and joyously, is to become a center of attraction. Indeed, to be what one is, is the first requirement to becoming all that one may desire to be.

The assumption of naturalness is never a descent. It is not the comedown which so many people fear. Even if it were, it would be wholesome to endure it if only for the sake of killing the fear; but it is not a comedown; it is an ascent. It is unbinding the shackles of deception; it is stepping up into freedom. And with that the qualities of the true character begin to emerge, until the assumed thing becomes a death mask in comparison with the reality.

Some people are afraid to be known for being as decent as they are; they mask their kindness with brusque words; they paint themselves with clay to make themselves like their fellows. But they cannot hide the difference. Nature has a voice that speaks to every known sense of man, and to senses as yet undefined. We cannot hide ourselves.

Beginning with what we are, as natural human beings, is the surest way to arrive at all we may become. There is no artificial road to natural development.

## *The Time of England's Trouble*

BY THE time this is read, conditions in England may have developed beyond their status at this writing. But certain points seem clear even now. It appears that the period of the coal subsidy in that industrially disjointed country may not have been entirely profitless. The time appears to have been well used by the people and government of England in considering the emergencies they may be called upon to face. People and government have resolved that law and order, which mean also the daily supplies of the nation, must be maintained. The government has exhibited a commendable firmness in dealing with what amounted to a competitive government. Premier Baldwin in his initial resolutions has shown himself a strong man, worthy of the people's confidence. The nation itself has learned that, mixed with the justice inherent in labor's discontent were other elements whose objective is not the elimination of discontent but its increase that the nation might be overthrown. This in turn has led to the creation of a vast volunteer citizen's movement for the maintenance of supplies, which guarantees the tiding over of the emergency.

But at bottom it is not the safe passage through a strike, or even the breaking of a strike, that is the paramount need of Britain. It is the reorganization of the nation's business on a foundation of equity. With as high a civilization as any can boast, the financial leaders of Britain have been amazingly backward in recognizing the fundamental fact that no people can be more prosperous than are its workers. The greater interest of Britain in industrial efforts has been dividends rather than wages, and in this age of the world that interest can no longer predominate. The situation is complicated, it is true, by a large anarchist influence directly traceable to Russian propaganda, but even with that eliminated, Britain has still her own industrial problem to the solution of which her best political and industrial statesmanship must immediately be applied.

It is idle to suppose that a British populace can permanently be kept behind the rest of the world in human rights. It is British progress rising against British backwardness that must be reckoned as the core of the present troubles. "Britons never will be slaves" is now coming in for its industrial interpretation. As in the American Colonies it was British nature demanding British rights from a backward British aristocracy, so today it is the deep blood of Britain rolling up against the strongholds of reaction and demanding rights which no civilized public sentiment will challenge. That demand will never be thwarted. Its invincible character spells Britain's salvation. If British workingmen could be beaten in a just cause, it would spell Britain's doom. And there can be no doubt, whatever the interim will bring, that a good ending will come of the present tribulation.

## *Twelve Good Men and True?*

THROUGHOUT the nation the question is being asked with increasing solemnity: Is the jury system a failure? Sober-minded citizens, appalled at the number of unpunished murders and other high crimes, sickened at the sight of criminals, palpably guilty, turned loose in wholesale lots, are inclining to the belief that it is.

Trial by jury is one of the greatest contributions of the Anglo-Saxon race to justice and order. It is inherent in that race; its ancient foundation is lost in the dimness that obscures our racial beginnings. For centuries it has stood as a bulwark against aggression and oppression. It has protected the weak from the strong; it has safeguarded the innocent; in former days it checked the encroachments of the powerful classes. Men by the thousands have died to maintain the right of a man to a fair trial by his peers.

Trial by jury is one of the fundamentals of American law. It was carried into the wilderness by the earliest settlers. While we were a homogeneous people it functioned well; crime was infrequent and punishment was swift and sure. But there has come into the country a vast alien element, unfamiliar with American traditions, unsympathetic with American ideals. To this element there is nothing sacred about the jury system. It is but a means to an end. The jury system is based on the tenet that "twelve good men and true" shall declare the guilt or innocence of the accused. But what if one of the twelve men is not "good" and "true"; *what if he is steeped in the tainted philosophy of a decadent race; what if he is faithless to his trust?*

The jury system in itself is not faulty; it is not a failure. But it is a system evolved by the Anglo-Saxon race for the Anglo-Saxon mind. The Oriental mind cannot comprehend

the principles of honor, of probity, of justice involved. *It is not the system that has failed.*

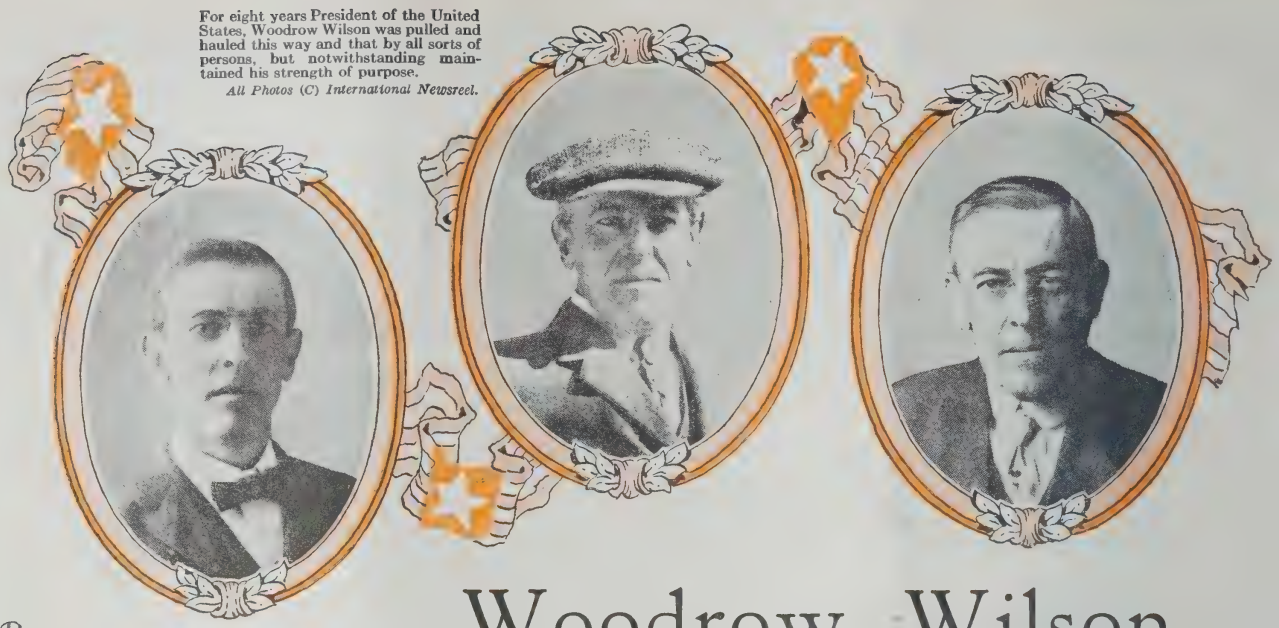
In the past twenty years (the years of greatest foreign influx) there have been 170,000 murders in the United States, 118,000 of them unpunished! There is a terrible indictment in those figures, not against the jury system, but against juries. Either we must devise some way of keeping juries pure, or we must surrender one of the greatest heritages of our race.

## *Police Death Roll*

IT IS not a pleasant picture THE DEARBORN INDEPENDENT presents this week as regards police duty in our large cities. We have before remarked that the crime situation in the United States has taken on the aspect of a war between two armies, the army of police and the army of criminals. The public stands back, unconcerned, as if it had no vital interest in either army. Perhaps it is this indifference which sometimes leads to an unholy alliance between police and criminals.

The killing of policemen is a blot on the United States. The line between Canada and the United States is not visible to the eye, but a tremendous difference exists on either side of that line, for whereas scarcely a police officer is killed in Canada during several years, hundreds are killed in the United States every year.

Yet THE DEARBORN INDEPENDENT article indicates that even this record has geographical limitations. Some communities witness the killing of police officers, and others do not. The reason for the difference is in the racial quality of the community itself and the sternness with which the police ally themselves with the populace as against crime. The facts presented indicate beyond a doubt that the condition is remediable, and by the police themselves.



We never have doubted that the vast majority of police officers were just what the name implies, honest guardians of peace and order. Yet we cannot doubt that there is also much collusion between the authorities and the powers that prey in this country. The "higher ups" among the authorities have a heavy load of guilt to bear for conditions which result in the murder of so many subordinate police officers. Chicago has presented a tragedy of strange mixtures—a prosecutor killed in the company of felons and both the official world and the criminal world hushed in a unanimity of guilty silence as to what it all means. Such a situation does not spell safety for the uniformed man on the beat. He is not being backed up as he deserves.

It is sincerely to be hoped that these almost inconceivable excesses of lawlessness will speedily result in such a revulsion of public feeling as shall clean out criminal authorities and criminal allies with a gust of sudden and destructive indignation.

## *The Family Is the Unit*

THE President's counsel with regard to American home life is sound; but it might have been more effective had he given the analysis on which such counsel rests. It is not evil influences that successfully attack the home and family so much as it is influences which most people regard as good. The natural unit of society is the *family;* but every phase of present-day life is influenced by the false philosophy that the *individual* is the unit. The process of family disintegration has been effected under the guise of good works and individual benefit. Father has been organized off by himself; mother by herself; brother by himself; sister by herself; the *family* belongs to nothing. Ninety per cent of the organizations of today are based on the assumption that the *individual* is paramount in society. It needs only half an eye to see that nature is careless of the individual, but holds the *family* as most precious. Father at Rotary or the lodge; mother at the women's club; sister at the sex-exclusive sorority; and brother, according to his age, at the Bachelors' or the Boy Scouts—these represent the divisions of the family which acknowledged good movements have brought about; and if this is true of the good, what must be true of the evil!

The fallacy of socialism is that it is not social but individual, and the fallacy of communism is that it is not communal but individual; and these are the sources of the insidious division of the family. Against socialism and communism their leaders have always recognized the family as the greatest enemy, yet what socialism and its developments have not been able to accomplish, these other good movements seem to have begun. It will not be for long, however. Nature is not defeated. But a clear conception of the influence of some of our good movements, as far as they affect the home, will help stem the tendency. We need to regard the *family,* not sentimentally, but biologically, as *the human unit,* and from that point of view form our estimate of all movements that tend to distribute the family into an artificial individualism. It is notable that the three basic human institutions, home, church and school, the pillars of our civilization, are strictly family institutions.

For eight years President of the United States, Woodrow Wilson was pulled and hauled this way and that by all sorts of persons, but notwithstanding maintained his strength of purpose.

# Woodrow Wilson—

## The President's Refusal to Be Rushed Into Hasty

By HUSTON THOMPSON

Copyright, 1926, by Huston Thompson.

PART IX.

*"If you can wait, and not be tired by waiting,*
*Or being lied about, don't deal in lies."*

NEVER in Woodrow Wilson's dramatic career was his ability as a "waiter" more clearly demonstrated than when the militant suffragettes picketed the White House, in 1916 and 1917. There were two organizations, the militants and the conservatives. The issue was adoption of a constitutional amendment, making woman suffrage compulsory in the states. The non-militants endeavored to gain support by persuasion. The militants tried to dragoon the Wilson Administration into passing the resolution through Congress.

At the head of the militants were Alice Paul, Mrs. Gilson Gardner, Abbie Scott Baker, and other well-known radicals. The conservatives were led by Mrs. Carrie Chapman Catt, Dr. Anna Shaw, and others. The latter were using argument; the former, demonstrations and what they thought was force. Every afternoon a procession of militants would leave the organization's headquarters, bearing banners demanding of Mr. Wilson how long he was going to deny women their rights. They would parade around the White House and then take up their positions on either side of the front gates on Pennsylvania Avenue.

"You had better slip out through the rear gates," White House attendants used to suggest to the President as he got into his automobile for an afternoon ride or for a trip to the Virginia hills for golf.

"Why?" he would inquire.

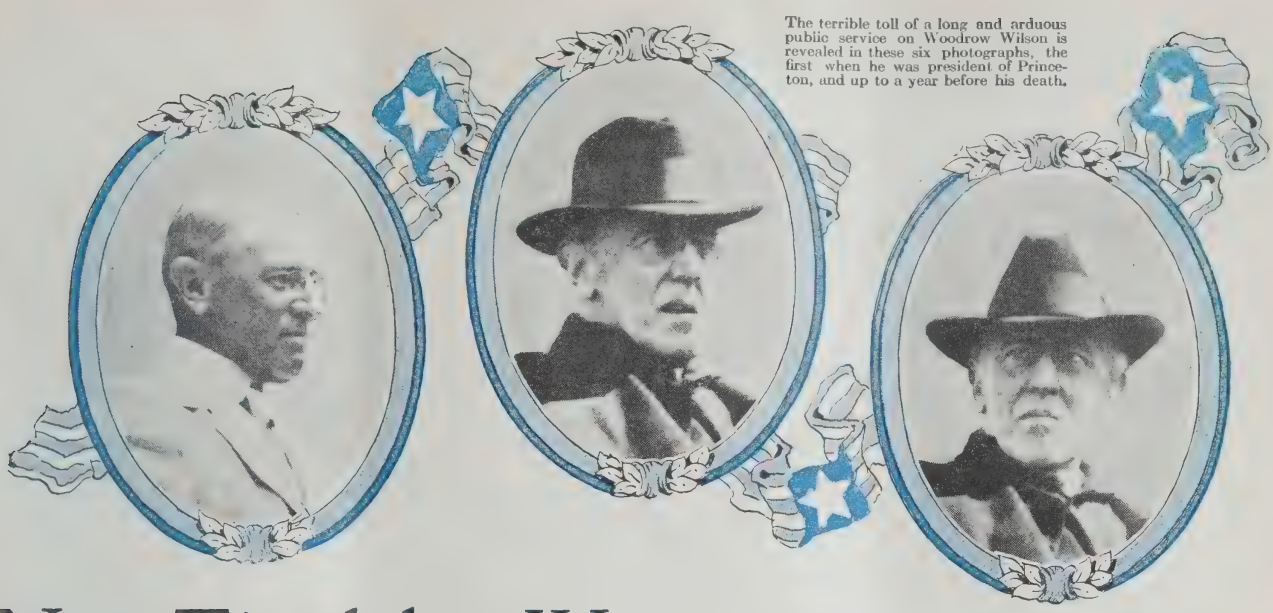
"The suffragettes are picketing the front gates," he would be advised.

"Oh, I don't mind them," was his laughing reply, and would ride out of the White House grounds between the flaunting banners, without, apparently, being conscious of their existence. Indeed, so little concern did he feel for the militants' efforts to intimidate him that he would completely forget he was being picketed until he drove through the gates and saw the banners.

*(C) Keystone.*
Carrie Chapman Catt.

*(C) Keystone.*
Helen Hamilton Gardiner.

At frequent intervals the militants would gather several hundred followers, hoist scores of banners and spend a whole afternoon marching around the White House. They discussed excitedly the probable effects of their actions on President Wilson. Speculation was extensive as to the impression they were making. Pretty much all the opinion was that they were pressing Wilson hard, that he was worried at their picketing, that he feared public opinion, that he was cracking under the strain, that he might capitulate at almost any moment.



The facts of the case were that he was "waiting" and was not "being tired by waiting." He was far too busy in those trying pre-war days to give more than a thought to what he considered the senseless antics of a group of misguided fanatics. When he thought of them at all it was with tolerant amusement. From beginning to end of that strange chapter (which finally became almost tragic) he never took the picketing seriously.

Some of the President's friends and advisers, however, felt concern. No one was apprehensive for any political reasons because all believed (whether or not they were right) that public opinion in the country was opposed to the White House picketing. The District of Columbia police and their superior officers, the Secret Service and the State Department, felt that such a condition, spread over months, was undignified and dangerous. Mr. Wilson was approached.

"Let us break up this picketing," he was urged by the District commissioners.

"Not at all," he replied, good-naturedly. "I wouldn't interfere with them for the world. They don't bother me a bit. Let them alone."

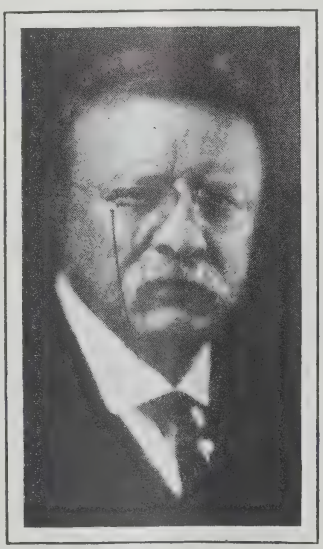
Weeks passed and conditions became worse. Larger crowds gathered. The pickets thought they were winning.

The terrible toll of a long and arduous public service on Woodrow Wilson is revealed in these six photographs, the first when he was president of Princeton, and up to a year before his death.

# Not Tired by Waiting

## Decisions on Important Affairs Caused Much Criticism

They organized a huge demonstration for a Sunday afternoon. Thousands of adherents marched in line but it turned cold and rained. The banners became bedraggled. Hats melted.



The authorities kept hands off and the picketing continued until the United States severed diplomatic relations with Germany. Then the District commissioners sent for the militant suffrage leaders.

"Look here," said the commissioners, "we are going into war and must present a united front to a common enemy. As the officials charged with responsibility for the safety of the President and the capital of the country during a war, we appeal to you to give up your militant tactics. When the war is over you can go back to them, but in the meantime all loyal Americans should support the President and the Government. War will undoubtedly come and we must all pull together. We must not give the enemy the satisfaction of seeing any discord. Will you give up picketing temporarily for this reason?"

The militants said they would take the commissioners' request under advisement. No word of what had been done was given President Wilson. He knew nothing of the request, either then or later.

A few days afterward the militants sent back word that they were within their rights and would continue to picket the White House, war or no war. They intimated that their cause was greater than that which was plunging the country every day nearer and nearer to the conflict. Again the commissioners appealed to Mr. Wilson and again he earnestly requested them to do nothing to interfere with the suffragists. They kept hands off and the picketing continued. War was declared. Spring and summer came on with war preparations in full swing and still the suffragists stood beside the White House gates with shouting banners.

By this time another and more serious element had entered the equation. Evidence of German spy activity was plentiful. Fears were entertained for the life of the President. Guards were thrown around the Southern Railway bridge, carrying the only railroad line connecting Washington with the Southland. Troops patrolled the aqueduct from Great Falls, the source of Washington's water supply, which could be destroyed by one stick of dynamite. Every precaution that could be taken to safeguard the national capital was adopted—and still great crowds thronged about the White House gates every afternoon to watch the President pass between the suffrage pickets. An infuriated citizenry finally lost its temper and, one afternoon, assaulted the pickets.

Theodore Roosevelt.

The issue was clear. The crowds were outraged that anybody should try to embarrass the President in these critical hours. They suddenly turned against the pickets and beat them up. The police reserves were called out and a young riot was shortly in progress.

The suffragists gave out sensational statements that President Wilson had set the police on them. The next day the pickets were on hand as usual and the crowd was greater. Police were also present in large numbers but again efforts were made to mob the picketers and again a riot followed, with another hour's fighting at the White House gates.

That night the Secretary of the Treasury (who has direction of the Secret Service, which protects the person of the President), the commissioners of the District of Columbia, and an Assistant Secretary of State pleaded with President Wilson to permit the breaking up of the picketing. Again he refused.

"Don't you see," he explained patiently, unruffled by the fact that his "waiting" was being sorely tried and that he was "being lied about," "if you arrest them you will be playing their game? If you put them in jail they would start a 'hunger strike' and give out all manner of stories about their treatment. I know it is unfair to other District needs to use your police force for such duties but my wish is that you give the picketers every protection and let them picket as long as they please. Instead of trying to stop them, work on the crowd; get the crowd to let them alone."

Another riot occurred the next day, after which, without saying a word to

Mr. Wilson, the commissioners acted on their own responsibility. They instructed their Superintendent of Police, Major Raymond W. Pullman, to arrest the pickets the next day as soon as they took position, before any mob violence could get started. Pullman followed orders. Mr. Wilson knew nothing about it until it was all over. The pickets were arraigned in police court the next morning and an indignant judge gave them sixty days each at the workhouse, an industrial farm twenty miles below Washington on the Potomac.

*How the Suffragist Question Was Settled*

Mr. Wilson's prediction was instantly fulfilled. The suffragists started hunger strikes and gave out daily statements about their harsh treatment, which was laid directly at Mr. Wilson's feet. A few days later he exercised his executive authority over the District of Columbia by pardoning the imprisoned women. Instead, therefore, of being the prime agent in antagonism to them, Mr. Wilson was the sole official in Washington who showed them any sympathy. His patience never ran out and in the end it was to him that they owed their release.

The actual conversion of Mr. Wilson to woman's suffrage came the next year and was brought about very largely through the persuasive influence of Mrs. Catt, Mrs. Gardiner, and his daughters, Margaret and Jessie.

"When I find such fine, gentle ladies as Mrs. Catt and many others advocating suffrage," he said, in explaining his change to advocacy of the National Amendment, "I am forced to the conclusion that there must be a real, widespread desire for the ballot among the ladies."

The more Woodrow Wilson became one of the principal actors in the drama that ensued upon his entering the White House, the more he refused to seek justification for his acts through personal assertion. If people lied about him he refused to deal in lies. He was fully aware that many of these lies were going the rounds but from all outward appearance they did not affect him.

His willingness to wait for the judgments of the future is illustrated in the incident involving the change of General Leonard Wood from Governor's Island in New York Harbor to Charleston, South Carolina, just previous to the outbreak of the war. It will be recalled that General Wood was Chief of Staff and in command of the Eastern Division of our Army with headquarters at Governor's Island.

There had been pressure brought to bear upon the President and Secretary of War Garrison to remove General Wood, but they had refused, saying that he should have the right to serve his term out. Some time thereafter General Wood had permitted Colonel Roosevelt to deliver an address to the "rookies" at Plattsburg in which the Colonel had caustically criticized the Administration for what he charged was its weakness in conducting foreign affairs. This brought forth a public reprimand upon General Wood from the Secretary of War.

Then on March 25, 1917, the newspapers noted that President Wilson had made a call upon Secretary of War Baker. On the following day the War Department issued orders transferring General Wood to Charleston, South Carolina, putting him in command of the newly created Southern Division, the order to take effect May 1. This move of the Administration was a tremendous surprise both to the military and the public, and was the immediate cause for bitter criticism directed at the President. He was charged by his enemies with playing politics, and his order was characterized by General Wood as "petty politics."

It was said that on March 27 two telegrams were shown at the War Department offering General Wood either a station in the Philippines or Hawaii, though there is apparently no authentic evidence of this fact.

Out of the maze of criticism and charges it developed that Secretary Baker was seeking to decentralize our forces, dividing the number of geographical divisions of our forces into six instead of four, with the Southern or Charleston Division covering the territory south of the Mason and Dixon Line and east of the Mississippi River.

Now, the Wilson family sought to keep itself quite familiar with the press accounts of what was going on at that time. On the day following the order removing General Wood from the Eastern to the Southern Division there was considerable excitement in the family owing to the criticism and charges of politics contained in the press with regard to the removal of General Wood. When Mr. Wilson came to the luncheon table he was besieged by members of the family to know what it all meant.

*Why General Wood Was Transferred*

When the family bombarded the President with their questions Mr. Wilson replied, with the remarkable confidence he placed in those around his board, that the reason he had moved General Leonard Wood was because when we went into war (war was not declared until April 6, 1917) there would be more cantonments placed in the Southern Division than any other, since that territory, because of its climate, would have a longer training period and a more open season for the soldiers. He said that he had transferred General Wood to Charleston so that as soon as war was declared he would have the greatest possible chance for developing troops, since he regarded him as about the best man in the Army for training soldiers.

"Then why don't you state this to the public and silence this criticism?" asked the members of his family.

"It would be impossible for me to give out my plans now," replied the President, "as to what I might say about General Wood. Can't you imagine the reaction? No explanation would satisfy the crowd that is making this attack. They would not believe me no matter what I said. They would say that their attacks were getting under my skin and I will not give them even that satisfaction. Time will tell whether I am right and I am willing to await the verdict of the future."

(C) *Harris & Ewing.*

President Wilson, very weak from his illness, appearing before some of his admirers among the women voters who, several thousand strong, made a pilgrimage to his home.

As America plunged into the war it became inevitable that there would be a conference of some sort between President Wilson and Colonel Theodore Roosevelt. Ever since 1912 Mr. Roosevelt had been an incessant critic of the President. As the World War spread and drifted toward us, Mr. Wilson was struggling desperately to keep us neutral,

# World War's Effect on the Negro

## Overseas the Colored Soldier Acquired an Entirely New Estimate of His Importance in the Scheme of Things

War problems crowded thick and fast: the negro leaders assured us that our war was also the negro's war and men in khaki and women in Red Cross were tangible evidence that the negro race was whole-heartedly giving itself.

By TOWNSEND BOYER

ILLUSTRATED BY J. C. GRAHAM

NOT the least of the important changes in American life wrought by the World War was in the established order of race thought and race feeling in the South.

The first of these changes came about the time of our entrance into the war. The white people had hardly more than heard the first whispered rumors of the German plot in Mexico than negro leaders began to appear on public rostrums and assure the white race that while their sympathies had been with Germany and not Belgium because of the latter's atrocities to the negroes in the Belgian Congo, they had no thought of letting this sympathy go to the extent of turning against their own country to further Germany's war schemes.

The white people were astounded. We had always thought that we could see through a negro's heart and mind as through glass; that he was really incapable of thinking save as we directed and led. But not only was the negro thinking directly opposite from our way of thinking; he could do it so quietly that our very cooks and yard boys were hiding under their bland masks knowledge of a thing which if even attempted would have caused America trouble.

To the credit of the wisdom and patriotism of the negro leaders, they had the thing crushed almost before we were aware that German propaganda was seeping through underground channels into our very households.

The affair, however, caused the white race to look at the negro with different feeling. We realized that the negro, despite our constant association with him, had subtly changed right under our eyes; he had begun to think for himself. We realized that he was no longer a passive force in our life, but a potential power for good or evil, and that this latent power was stirring restlessly.

But war problems and cares crowded too thick and fast for us to allow this episode to dwell long in our thoughts; the negro leaders had assured us that our war was also the negro's war and men in khaki and women in Red Cross and war work were the tangible evidence that the negro race was whole-heartedly giving itself to the war, and that was sufficient.

The next change was on our side and came about less dramatically. While white people will go to almost any length to show appreciation or to favor an individual negro, almost never can an appeal on behalf of the race as a whole be made to the Southern white people. Our inclination is to concern ourselves with only such parts as each day brings before us, leaving the rest alone. But this whole-hearted surrender of the negro to help us in the war, when he had not had a thing to do with our getting into it (and we knew that he would not have a thing to say about how it was conducted), appealed to the white race as nothing the negro race had done since its freedom. There swept over us a wave of good feeling and enthusiasm for the negro almost as vigorous as the present negro fad in the North.

Men everywhere were saying that the negro was earning for himself the right to more voice in governmental affairs and that he should have it. By a strange turn of destiny the negro was in position to achieve during the World War's four-year period what he had been unable to obtain in a forty-year struggle.

At last the war ended and the boys in khaki began to come home.

But between that going away and that returning something had happened.

For all our flag-waving, our songs of victory, our war memorials, our dances and our barbecues, there remained in the eyes of our white soldiers a quiet, subdued expression, and about the mouths were hard, cynical lines. Notwithstanding our persistent importunities for the story of "over there," they remained strangely, puzzlingly reticent. In appearance and behavior the Southern white soldier came home from the World War looking exactly like a man who had been "sold" and did not care to dwell on the humiliation and the disillusionment.

Quite different was the black soldier. In place of the shuffle-footed, ashen-faced farm hand or street loafer who laughed much and talked loudly to hide his fears, there returned a springy-stepped, up-shouldered man. Easy poise and quiet confidence had taken the place of boisterous manners. Even Southerners, who are slow to see charm in a negro, were compelled to admit that here were the manly graces in no small degree.

In the crowds that pressed about to hear the negro soldier's story—and we wanted to hear them all in those days—were white women as well as men. As we listened to those soft, drawling voices telling in their own inimitable way of such things as salt water, gas masks, hair-straightening fright, barrages and going "over the top," we caught something in those dark eyes that never before had we seen in them. Not only were they looking straight and level-eyed at the world about—including the white women whom centuries of ironclad custom said must never be included in the direct gaze of a black man—but there was a light in those eyes strikingly like triumph.

Rumors followed in the wake of the returning soldiers, rumors that touched the nerves of Southerners like the screech of a knife on a dinner plate. As the boys arrived home in greater numbers the rumors began to assume a definite form, though the white boys said little. Some things are so little to the liking of the white man of the South, so crammed with forces of volcanic possibilities, that he is unwilling to concede them as the reality even of talk. And

# Dry-Farming—the Tragedy of the West

## Scores of Deserted Homes Stand as Mute Monuments to the Settlers' Struggle in a Land Where Rain Seldom Comes

By F. J. CLIFFORD

ILLUSTRATED BY HARLAN JOHNSON

"This is a God-forsaken sunbaked inferno of a country . . . I don't want to ever see it again."

TWO lean cayuses, hitched to a creaking wagon, make their way over a seldom-used, unfenced road. With drooping heads, they plod along by the thin wheat—six inches high, headed out and ripe enough to cut. A faithful dog half walks, half trots under the rear axle. An odd owlish look is given his eyes by a cloud of dust that languidly drifts with them.

The dust lays an ever deepening mantle on the roughly clad figures of two persons seated in the wagon. One is a woman young in years, but old in features, tanned and leathery brown. In the palm of her hand she takes some water from the canvas water-bag swinging from the end of the seat and sprinkles it over the clothes and face of a baby lying in her lap. The child gasps, but stops its fretting in the following coolness. The patient eyes of the woman lift questioningly, a little worried, to the man at her side. His eyes are dulled and nearly closed as they take in the panorama of brown hills about them—hills that were so green and verdant in the springtime. Now the dead color is only relieved by the dusty green of scattered clumps of sage.

Ahead of the outfit, a horned toad scuttles swiftly along in the wheel track. To one side, a rattlesnake glides and coils menacingly under the shady protection of a shelving rock. A little brown owl springs from his guard-mound in front of his hole-in-the-ground home and flutters overhead, twittering excitedly at the interruption of his torrid meditations. But from the man these receive no attention.

His bony hands, much calloused from battling with nature, rest on the worn and faded knees of his khaki overalls. His eyes take on a look of hardness, of bitterness, when he glances back into the wagon at his pitifully few belongings. But the hardness and bitterness melt into pity and protection as he looks wistfully at his wife and small child beside him. No word is spoken by husband or wife as their eyes meet for they understand each other. Adversity has held more husbands and wives together than all the material wealth of the universe.

Where are they going? Where are they from? What country are they traveling through? God only knows. It may be Washington, or Idaho, or Montana, or Colorado—the picture can be duplicated in almost any of the Western states.

Who is he? One of the countless thousands who thought they could win a fortune at dry-farming. Instead of fortunes, they have left many monuments in the form of little homes all over the West, untenanted save by fuzzy-tailed pack rats.

I have stepped inside scores of such; some newly abandoned; others in the last stages of decay. One was in Wyoming. The wind-swung doors creaked dismally on their hinges. The windows gaped like sightless eyes. On the floor were scattered overalls sadly worn, babies' shoes, a woman's hat, photographs taken back in Ohio, a scrap of a homesick letter telling of the drought, no crops, and ending:

"This is a God-forsaken, sunbaked inferno of a country, peopled with jack rabbits, horned toads, and rattlesnakes, and I don't want to ever see it again."

In one corner, scattered over a pile of old magazines and papers, I found the remnants of a song sheet. It had been torn to shreds. One piece I glanced at contained these words:

> Where fewer hearts in sorrow aching,
> That's where the West begins.

As far as the eye could see stood gray homes, apparently deserted. I wondered how many of their owners had listened to the lure of a Western song.

It is not likely that I would ever have written this article, had I not met so many people in the East who had been "Out West," and had not gone back a second time. It is a common expression in the West, where I live, that "You've got to go West twice to stay." I was surprised to find that so many failed to make the second trip. Many, many times have I seen men sell their worldly possessions for what they could get, and as they hit the trail for the East, swear they would never return.

*Swore They Would Never Return*

Their hearts swelled with bitterness when some of them told me why. I felt half guilty—a party to some despicable crime—when they related how the land they had migrated to had thirstily absorbed their hard-earned savings; how they found farming methods so radically different from those in the East, that their limited means were exhausted before they could become accustomed to the new conditions. Many missed the green hills and hardwood trees. Others spoke scathingly of the lack of friendliness of Western people.

They seemed to forget that a grouch in the East is a grouch in the West. A ne'er-do-well in one locality will find little opportunity in another.

Dry-farming seems to have an ex-

ceedingly strong lure for Eastern people. The pamphlets they receive from Western promoters describe a land most wonderfully productive, and cheap—which is very true. They show pictures of wheat yielding forty bushels an acre, and other crops in proportion, which is again quite true. The promoters agree to sell the land on any kind of terms, as long as there is a good-sized initial payment made.

*The Long Wait Between Bumper Crops*

What they fail to state is the long wait between these bumper crops. If it were possible for a rancher to put his livestock to sleep, he and his family crawl into the cellar and exist on air for six or seven years, until a kind Providence announced a year of ample harvest, all would be well, but, unfortunately, this is quite beyond their power.

Generally speaking, dry-farming is the art of producing crops from the land with little if any summer rain. Thirty bushels of wheat has been grown by trained dry-farmers when not a drop of rain has fallen from May 15 until September 14. This can only be done on certain soils. Those of volcanic origin are conceded to be best for this purpose.

After a season of blazing sun and hot winds, this soil may be found dry as a bone to a depth of forty feet. But when the autumn rains, the winter snows and the spring showers have soaked in, then the moisture may be down three or four feet. This, without a June rain, is not sufficient for a crop. So instead of taking the rather slim chance of a soaking rain coming at the right time, most of the successful dry-farmers summer-fallow the land. This differs from the Eastern method, in that it has to be harrowed after every shower, big or little, so as to keep a mulch on the surface. If this were not done and a crust allowed to form, the moisture below would escape through it. For this reason, a rain that does not penetrate to the moisture below is only detrimental.

When the moisture of another autumn, winter and spring has been added, the farmer can proceed with a fair assurance of an ample crop.

Occasionally a soaking June rain will visit the country. When it does, many a man is made wealthy by the enormous crop which results. But rain seldom falls, although dark clouds will drift overhead, amid the flash of lightning and rumble of thunder. Simultaneously a gale of wind arises, chasing the clouds away, and leaving the shining sun in sole possession of the sky.

On irrigated lands, the returns are bountiful and sure. If alfalfa, wheat, and like crops are being grown, the water should be cheap—fifteen dollars or less an acre—although the locality will vary that price considerably.

Only apples, pears, prunes and similar fruits can be grown at a profit on the more expensively watered lands. With sufficient knowledge, careful management, and personal supervision, many an owner has become wealthy in a few years. Three thousand dollars an acre is often paid for full-bearing apple orchards, of popular varieties.

A constant and sure water supply is the prime requisite of irrigation. Through lack of it, the grower may have to strip off the apples to save his trees. A growing menace is the deforestation of mountain slopes. With the fir and pine gone, the warm sun and wind of early spring have a full sweep at the snow, rapidly melting it, so that it pours down the canyons and valleys in a mighty flood. But when the trees stand thick and green, the snow is held back for weeks. In fact, one can leave the valley where roads are dry and dusty, and the fields green and verdant, and by driving for an hour and a half reach the forest, where snow, sheltered by the timber, will be three or four feet deep, slowly melting and feeding the life-giving mountain streams.

*When the Family Purse Becomes Lean*

On asking people of the East the altitude of their locality, practically none of them knew what it was. With some it took a certain amount of explaining to make them understand the question. In the West, with its valleys and mountains, almost every one knows the altitude at which he lives. It is very necessary. Apples, grapes, peaches and the like, may be growing in luxuriant profusion on one spot, when a ride of fifteen miles will take one where they will not grow at all. Long after the luscious Bing and Lambert cherries are gone in the valley, a comparatively short ride to the mountains will take one to where they are just ripening.

Often a whole family—father, mother, four or five children, and the dog and cat—drive westward in their car. The city campground is their rendezvous. When the family purse becomes lean, the family will stop to work in the harvest fields, apple orchards, or in some other employment.

The way to get first-hand knowledge of a country is via the camp-car route. One thing is vital. Any lack of money should be offset by a greater knowledge of the in'ards of your automobile. It is not costly to travel the camping route. About five cents a

Adversity has held more husbands and wives together than all the material wealth of the universe.

# Moonlight Midnight on "Old Tim"

## Climbing a Wonder Mountain While the Rest of the World Sleeps

By WYMAN SMITH

TO CLIMB a mountain by daylight may provide excitement and enough thrills, but to toil upward all night while the moon casts its light upon waterfalls, over ice sheets, and along the edge of precipices is almost like going on a pilgrimage. And when that mountain is Timpanogas or "Old Tim," as it is nicknamed, the mountain which carries one of the greatest botanical gardens in the world on its jagged slopes, and which has a glacier one must take an hour to climb, then the ascent becomes a living ecstacy. No wonder five thousand persons from far and near drive down the Salt Lake and Utah Lake valleys every year, gather around a blazing bonfire six thousand feet from the top and in crowds of fifty, a hundred, two hundred, three hundred, wait anxiously until the guide shouts, "Let's go" and leads the long excited file away up the first ravine.

Some few old-timers carried alpine stocks, for many indeed feel the year incomplete unless they have made that moonlight climb to the summit, but the novices carried no sticks or canes —they cut them later somewhere between the bottom and the top. For, although old men of eighty years have struggled to the peak, that long seven-mile trail which rises over a mile is no boy's play. It is something like hard grueling work, but done for the glorious privilege of watching the rising sun appear over a world of mountain ranges and purple shadows of valleys.

If anyone doubts before he climbs, afterward he will no longer wonder that the aborigines built great fires there in sacrifice to the many gods who dwelt among those crags and battlements and who planted there so many flowers that Dr. Henry Cowles, ecologist of the University of Chicago, once said, "It is the greatest wild flower garden in all the Americas, North and South." Yet that night we saw no flowers, we felt only the proximity and fellowship of the crowd, we heard only the seething rumble of the waterfalls, and we saw above and below on the trail the gleam of flashlights making little points in the darkness.

Only for a ten-day period of the year is it possible to climb at night, for then only does the moon rise to light up the most dangerous portions of the ascent and then only has the ice melted enough to make climbing safe for those not experts. We had selected one of those nights—a clear-blue night during the first part of August. It was hot in the valleys, and even at the starting point, where the elevation was five thousand feet, we felt burdened with woolen shirts and leather jackets. We scanned the crowd gathered inside the glow of a leaping, roaring log fire, but they, too, were clothed as though for winter and so when the march began, and lilting songs led the way we retained our heavy clothes —they might be useful before morning.

On the trail that leads past waterfalls and columbines to the summit of Timpanogas.

That was at ten o'clock—the moon had not yet risen above the eastern ridges, but the white snow patches above looked like spots of moonlight.

At first the trail was easy, broad, and with scarcely a perceptible rise, and the first mile was covered almost before we knew it. For everyone was jolly, and everyone addressed everyone else; faces were lost in the shadow and only the silhouette of individual figures made it possible to distinguish the owner of a voice. Who composed that crowd?—doctors, storekeepers, a university president and his wife, students, bankers, clerks, stenographers and farmers.

When we rested for a few minutes there was much cutting of alpine stocks, and after the first two miles chocolate bars appeared and tin cups were in demand to obtain drinks from springs which bubbled from rocks along the way. No use to drink too much of that cold water, however, for it only abetted the thirst. We looked upward to what seemed the top rising against the sky line but we were told that it was only a halfway mark to the summit. The trail was growing steeper now, the rests came oftener and the van and rear of the ascending line showed a zigzag in the trail. We reached another waterfall which poured down upon the trail itself and it required careful stepping if one wished to keep dry feet. High rocks rose at one side, wet and mossy to the touch, and below the slope dropped quickly to become lost in the shadows.

The moon was a long time coming. There was no more singing; all were conserving their breath. The air grew cooler.

We came to the first snow crossing, a strip a hundred feet wide and stretching far above and below. A rope was strung across and a man at each side held it until perhaps a dozen had passed when he gave the rope end to another. We crossed above the rope, using it as a rail while we dug our heels into the hard snow crust. The line began to thin out, straggling along in different fashion than it had an hour before. Then another snow crust and at one side we heard the gurgle of a stream coming down beneath the ice. We climbed on more leisurely now, for little groups rested here and there. But we were getting up, the scrawly cedars windblown into grotesques and the disappearance of the pines told us that. Rumor came from the front that the hardest part of the climb was over, that we should soon be at the meadows and find easier walking. But the zigzags kept on for what seemed miles.

Finally we topped a ridge, and away before us stretched a wide opening, a mountain valley on the mountain top. We were above the timberline, and about two-thirds of the way to the summit. That was welcome news and we rested a long time.

Walking was easier, and the moon had come up to flood all the surroundings in silvered glory. At our left a stream

gurgled along, and around were low hills and small dips which still beckoned us to climb on into the mystery. Back of us we could see lights sparkling, lights from cities ten and fifteen miles away.

Around a corner—the smooth white ascent of the glacier, more than a mile long and sloping upward smoothly, evenly, and glistening in the moonbeams. We hurried on now, skirted the edge of two small emerald lakes and then stepped upon the hard snow of the glacier itself.

Halfway up we came upon a heap of boulders, black against the snow, where we could sit down for another rest while we considered the climb which led up the saddle. We saw no hopes of further light and accordingly when the breathing spell was finished we went on upward. The right-hand wall had caught some of the moonlight but the left-hand one loomed black and fearsome above us.

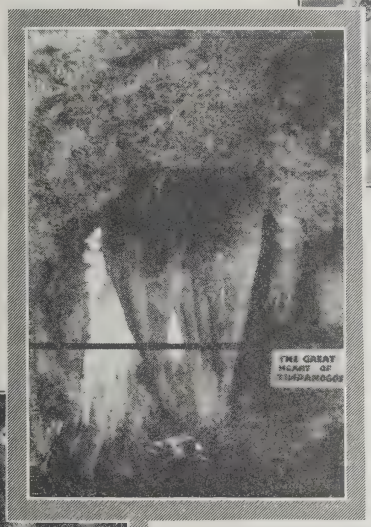
Presently the snow slope grew steeper, so steep we could not ascend directly but were forced to zigzag, digging our heels into the snow at every step. It was not far now—only a few hundred feet, but that was a snow ladder with no rungs. No one tried to pass another now—we merely straggled as best we could and when we were so tired we grew dizzy from exhaustion we sat down on the snow with our heels dug in. I looked below us and saw that although there was no danger anyone who slipped must roll and slide a quarter of a mile or more. Once down no one would ever dare the ascent again that night. One, two, three steps—rest. One step, two steps, three steps—rest. So we went on, dragging and fagged. At last the top of the saddle and bare rock to walk on. We perched on the flat space of rock and stretched out like dead. Then we realized the cold, cutting, damp, shivering cold. And from our alpine stocks we built a fire and huddled about it trying to keep warm.

It was two o'clock in the morning. Toward the west we looked into the valley from which we had come; sparkling lights of towns lay there, and beyond the broad silver ribbon of the moon lay upon the waters of Utah Lake. Then the fire again, a little munching of chocolate, and a few laughs at the last climb. Others came up, one and two at a time, and we greeted them; we felt like veterans now and we could afford to smile. Only an hour on the glacier seemed like long ages, like the tremendous efforts of dreams.

At four o'clock we left the fire and our knapsack with lunch and went on to finish the climb. No more steep climbing now, but very careful stepping, for the back of Old Tim is a narrow ridge, and sheer drops of several hundred feet yawned dark and fearsome below. I shivered once when I looked and then didn't look again

Slowly as the light came we saw the distant and lower mountain ranges rising from the night, coming up from shadow.

Then while one range after another became more distinct, and the purple twilight of dawn retreated before the crimson and rose and nacreous light of the sun, we watched and waited. Hours we stayed there, until all the world was lighted with brilliant, scintillating rays, and then we began a slow return downward to the place whence we came.

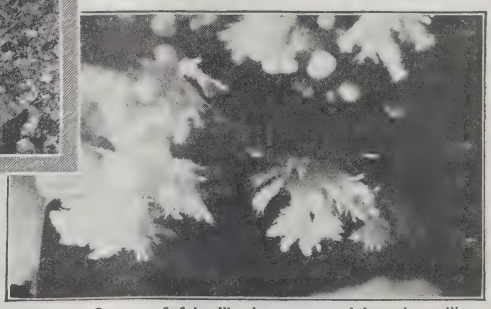


We did not hurry now; we were returning to the world from our worship in a temple of the universe, and the blue sky and the little flowers along the rocks called upon us to linger. We arrived at the saddle once more and looked down the glacier. Groups of four, five and six persons were sitting down at the top and preparing for the slide. The first movement let them down as in an elevator gone wild for fifty feet and from that momentum they were hurled forward forty or fifty miles an hour for a half-mile.

Like a path of flowers strewn for a bride was our descent, and we walked along banks of purple, delicate pink, crimson, magenta and blue blossoms.

We slid down the snow patches that had caused us so much trouble the night before. Was it just a few hours ago; it seemed like weeks so much had we seen and felt. Twelve days crowded into twelve hours. The world had been changed everywhere.

Then it grew warmer again, and soon we were back at the bottom, where the black embers of our camp fire still smoldered. We went around to the other side on our descent and stopped there to visit a cave. Nor was the cave so different; it, too, was filled with flowers, tiny, delicate marble flowers like samples of those we had passed. Millions of alabaster shapes and forms, strange stalactites like vegetables, like fairy handiwork, and like carved ivory flowers. And there before us in the dark interior of the cave, was a great hanging drop of marble, huge and white with a tinge of chrome. It was the Great Heart of Timpanogas.



Sixty miles an hour or more down the mountain slope, just after the drop-off from the saddle.

We passed the waterfall which had seethed and hummed through the darkness of the night before.

Alabaster flowers of fairy-like beauty carved into the ceiling of Timpanogas Cave.

## Turning Points in the Life of U. S. Grant

WHEN I was a boy," said General Grant, "my mother one morning sent me to borrow some butter from a neighbor. Going into the house without knocking, I overheard a letter read from a son who was then at West Point, stating that he had failed in his examinations.

"I got the butter, took it home, and, without waiting for any breakfast, ran to interview the Congressman for our district.

" 'Mr. Hamer,' I said, 'will you appoint me to West Point?'

" 'No,' he answered, '———is there, and has three years to serve.'

" 'But suppose he should fail, will you send me?'

"Mr. Hamer laughed. 'If he doesn't go through it is no use for you to try, Uly,' he replied.

" 'Promise that you will give me the chance, Mr. Hamer, anyhow.'

"Mr. Hamer promised. The next day the defeated lad came home, and the Congressman, laughing, gave me the appointment."

Another turning point was when Grant made his famous attack on Fort Donelson, in 1862. This fort was depended on by the South to seal the Cumberlands and protect Nashville.

General Buckner, commanding the Confederate Army, sent Grant a request for an armistice, to which Grant replied:

"No terms other than an unconditional and immediate surrender can be accepted."

This soldier of many battles earnestly hoped that after his long and vigorous service in the field, he might be allowed to lead a life where the responsibilities were not so pressing, and which should be, in a measure, one of quiet and peace.

But the people of the nation decreed otherwise.

In the battle for the presidency, in 1868, Grant was elected by a large majority. He said:

"If elected to the office of President of the United States, it will be my endeavor to administer all laws in good faith, with economy, with the view of giving peace, quiet and protection everywhere."

## Dry-Farming—the Tragedy of the West

(*Concluded from page* 17)

mile will provide the average car with gasoline and oil, and food for four. It is understood, of course, that the restaurants and hotels are to be left strictly alone at that price. A covering of cheesecloth for your bed, will keep out the 'skeeters. You can forget them when the Rockies are reached.

Do not make the mistake of converting all your material wealth into cash and making a grand splash of it. Too many have tried that. The scores of second-hand stores attest to the mistake. Where there is one establishment in the East that deals with secondhand household goods and personal effects, there are a dozen in the Western cities. It simply means that home seekers have gone into the West, and through lack of first-hand knowledge, misfortune, or not liking the country, have sacrificed everything to get back home.

# Wilson—Not Tired by Waiting

(*Concluded from page* 14)

while the Colonel urged us to go in with such vehemence that he passed from criticism to direct charges against President Wilson. In his eagerness he used large words with which to characterize Mr. Wilson's attitude. He coined the word "Chinafied" as descriptive of America's position in world affairs at that time. But, just as in the 1916 campaign, Woodrow Wilson refused to mention Mr. Roosevelt's name, so in those parlous pre-war times he met the Colonel's censure with silence.

When it became necessary to administer a rebuke because of Mr. Roosevelt's attack upon the Administration's attitude at Plattsburg before the "rookies," it was directed at General Wood and not at Mr. Roosevelt, and was given by the Secretary of War and not by the President. This conflict between the President and Mr. Roosevelt had not, of course, passed unnoticed in Washington. In fact, it was more keenly watched and its importance exaggerated at the capital than in the rest of the United States, since Washington is the center of army affairs and a hotbed of political gossip. So when the press reported, after we had gone into the war on April 6, 1917, that Mr. Roosevelt was about to descend upon the White House to obtain authority to raise and command a division for service abroad, political Washington was not a little excited. And when the romantic figure of Mr. Roosevelt appeared at the White House, amid a great flourish of the press, the public guessed and conjectured on what sort of reception he would receive from the silent, much-criticized President.

***Ex-President Interviews the President***

It must have taken courage for the former occupant of the White House again to cross the threshold of that historic place, where he had held such complete sway for seven years, almost in the position of a suppliant before his political opponent. Whatever his thoughts were, he did not hesitate, but advanced with the usual Rooseveltian courage, arriving at the White House shortly after eleven o'clock in the morning. Mr. Wilson had been notified of his coming, and came forward immediately to the door to meet the ex-President, where they shook hands cordially and then disappeared inside for an interview that lasted about forty-five minutes, leaving a crowd of newspapermen to speculate on what was taking place, and to await his return.

On his way out Mr. Roosevelt was met by Mr. Tumulty and the press. He came forth smilingly and apparently fully satisfied with his conference. In answer to the queries of the newspapermen he said that he had had a very satisfactory talk; that he and the President had discussed his plans and he had suggested to Mr. Wilson that there be a rider attached to the Increased Army Bill, sometimes known as the Selective Draft Bill, to include Mr. Roosevelt's plan.

***Mr. Roosevelt Offers to Raise Troops***

It was about noon when the President and ex-President parted. Mr. Wilson went almost directly to the luncheon table, where he was greeted by his family and some of his relatives, who were so anxious to know all the details of Mr. Roosevelt's visit that they bombarded him with questions. With his usual imperturbability Mr. Wilson detailed what had happened. He said that he had taken Mr. Roosevelt immediately to the south portico of the White House, which looks toward the Potomac, where Mr. Roosevelt at once launched into the purpose of his visit, saying by way of preface that while he had differed with Mr. Wilson many times and frequently criticized his political acts, now that war was declared, all must be united for the common cause, and he had come to offer his services and do everything he could to assist the President in carrying out the war campaign. He then sketched briefly his plan, which was somewhat along the lines he had pursued in raising and commanding volunteer troops during the Spanish War. It was his desire to have the authority and responsibility of raising a division to go abroad. This he thought could be done quickly and would not conflict with the Selective Draft Act.

"At this juncture I asked him," said Mr. Wilson, "how he proposed to officer the division, and Mr. Roosevelt replied that he would select the best officers he could obtain from the highest down to the second lieutenants among the trained men or officers already in the service."

Again Mr. Wilson interrupted to say that if Mr. Roosevelt's plan were carried out he did not see how the army could get the available men to train the troops under the Selective Draft Act, with perhaps a million to be prepared the first year and other millions soon to follow. "I suggested," said the President, "that our problem was not soldiers, but officers. I said that I feared if we adopted Mr. Roosevelt's plan we would find ourselves in much the same position as did Great Britain shortly after the outbreak of the war. That nation had rushed its small regular army, together with the best equipped officers, to the front at the very outset, and when this army was nearly wiped out, with the casualties among the officers tremendous, the British found themselves almost helpless in training another army."

***Conference Ends Without a Decision***

Back and forth the President and ex-President argued. While Mr. Roosevelt said that he approved of the Selective Draft Bill, he had probably not thought of the grave responsibility that rested upon the President in trying to put over such a far-reaching method of raising an army. In fact, Mr. Wilson had not urged a vote upon the Draft Bill in Congress, because he was not at all sure he could get it through Congress. At that very hour he was waiting to find out what the country thought about it, and watching for the opportune moment when he thought there was sufficient support, before risking a vote on the bill.

And so the conference ended with the matter undecided, and the gallant Colonel went forth to be confronted by the newspapermen, without having received any encouragement, yet undaunted and smiling.

***"They Find New Ideas —and Use Them."***

# The Voyage of the Victoria

## THE STUDENT

*Third of Series*

BY CHARLES J. FINGER

WOODCUTS BY PAUL HONORÉ

MAGELLAN had reached the age of thirty-three before he emerged from obscurity, and then his name was linked with a strange piece of business.

It was during the war between Portugal and the Moors, in 1513, at which time a fleet of four hundred ships and some eighteen thousand men at arms, with cavalry and sailors, left Belem on August 13, 1513, and arrived at Azemur two weeks later. The cause or the rights and wrongs need not detain us. By a treaty the Moors were to pay tribute to the Portuguese, and one Muley Zeyem objected, so Portugal denounced him as a rebel, his own people accepted him as a patriot-hero, both sides considered national honor was at stake and disclaimed responsibility, and the war was on.

Magellan was with the forces, but in so unimportant a sphere that his name is not to be found in any list of officers. Later we find him in the commissariat department, in charge of the booty taken from the Moors, and the historian Barras tells us that during a sortie he was wounded by a lance thrust which cut a tendon at the back of his knee and left him lame for life.

When Magellan comes into prominence it is in connection with a scandal, for he was accused of selling cattle to the enemy and letting them be driven off at night. About his guilt or his innocence there has been much argumentative ado. Some have painted him as a martyr, the victim of plotters, though why anyone should have plotted against one in so subordinate a position is not clear. Others have denounced him as an arch villain and traitor. However, his guilt or innocence cannot now be determined, and does not matter very much. It neither detracts from nor adds to his later great deed. The whole campaign was little more than a buccaneering affair on a large scale, and discipline, as we know it, was at a very low ebb. That must be clear from the amazing thing that followed the charges against Magellan, if he was a soldier. I say, if he was a soldier, meaning a combatant, for he may have been connected with the commercial end of the campaign, and very close to some of the agents of the master houses then pushing trade with vigor. If that is so, much that followed is partly explicable.

Without the knowledge or consent of his superior, he left the seat of war and went to Lisbon. Some say that he went to lay his case before the king, which would have the appearance of a jejune piece of business. Another has it that his purpose was to secure an increase of salary amounting to some twenty-five cents a month, in our money. But there is no record, no explanation, only a rubbish heap of speculation and supposition. What we do know is that Pedro de Sousa, an officer at the seat of war, reported in a letter to the king that Magellan was absent without leave, and next we find him returning to the scene of operations. It has an incredible ring, and becomes credible only if we consider Magellan as being closely connected with the commercial agents.

Magellan went back to Africa, was not tried, seems indeed somehow to have been relieved, then returned to Lisbon and sought audience with the king. Again there are guesses—that he wanted a commission in the India service, that he sought promotion, that he was after his expected raise in salary, that he was making steps toward the seeking of a route to the Spiceries by way of the west. At any rate, nothing came of the audience. "The king always hated him," says the historian Barras, but it is difficult to see why a monarch should harbor any feelings of resentment toward an obscure soldier with no notable record behind him.

When Magellan comes into prominence it is in connection with a scandal, for he was accused of selling cattle to the enemy and letting them be driven off at night.

Still, Magellan might have been taking what he considered as discreet steps to interest the king in his project, and doing it in such manner as to give and yet not to give, thus carrying himself suspiciously and making of himself an irritating visitor. At any rate, if such was the case, nothing was presented to whet the royal appetite or to stimulate imperial ambition. So we let guesswork go by the board and stick to facts.

And these are the facts as known. Magellan, at the end of his Moorish service, found himself unemployed. But we remember that he knew something of trade possibilities in the remote East. He had been close to the commercial agents in Africa as well as in India. He was one of those who had objected to using the trade vessels in the siege of Goa. He knew the strange story of the lone wanderer, Varthema, and how land stretched far beyond any point touched by the agents of the commercial houses. He also knew that Serrao had left civilization to cast his lot with the native ruler of a land "far larger and richer than that found by Da Gama."

There was another thing, most important. Some time or other he had come into contact with a thinker and a scholar and a reader of odd books. That scholar was a fellow-Spaniard, Ruy Faliero, of whom extraordinary tales were told and believed, for Faliero was popularly regarded with suspicion by the silly ignorant as one who dabbled in mysteries, and who identified himself with celestial intelligences. He was said to be an alchemist who experimented in the transmutation of metals, after the fashion of Jacques Coeur, and Trithemius, and Flamel. In reality he was nothing but a quiet student interested in mathematics and astronomy and geography. But he had done things. He had worked out a way to calculate longitude and had written a treatise on the subject, which, be it said, Magellan obtained possession of and carried with him as textbook and guide, when he sailed.

*Magellan Obtains Much Information*

Now Faliero, we are told by the historian De Herrera had seen a chart "preserved in the treasury of the king of Portugal, and made by one Martin of Bohemia, a man of great parts," and in that chart the strait was shown which Magellan afterward sought to find, and from Faliero "Magellan obtained much information concerning this strait." Such a specialized student would be very apt to know something of the globe constructed by Johann Schöner, the Nuremberg professor of mathematics in 1515, the year with which we are dealing.

Schöner was a specialist, as also was Faliero. We say nothing of that German translation of a Portuguese pamphlet giving an account of a voyage in a ship fitted out by Christopher de Haro, which account told of a Pacifico-Atlantic strait, nor of the Ruysch map, made in 1507, with a statement written across that part shown as Santa Cruz land, telling that Portuguese ships had gone as far south as latitude 50°.

To get things into focus, we have Magellan with his knowledge, meeting Faliero with his theory and tradition and mathematical ability, and while we know nothing of Magellan's movements for two years, we are told by Barras that during that time Magellan was often with Faliero and "always busied with pilots, charts, and the question of longitude." And between them they constructed a globe on which was shown the western continent and the route which Magellan and Faliero hoped to travel. That globe was presently taken to Spain, though we have it on the authority of all concerned that the part on which the strait was shown was left blank so that no unfair advantage could be taken. It was a case of the man engaged in scientific research meeting another of daring and original mind, with extraordinary persistence on both sides. The third factor, in the shape of energy prompted by love of gain, had not yet appeared upon the scene.

*He Forms a Pact With Faliero*

Presently Magellan and Faliero made an agreement. In whatever befell, they were to share equally. The project to find the strait was on no account to be revealed to any third person. In the meantime Magellan was to go to Spain and there wait until Faliero, having cleared up certain urgent business matters, could follow. If anything of interest concerning the venture transpired, then whoever knew of it was to communicate with the other within six hours, but on no account were any details to be given out except both parties concurred.

So on October 20, 1517, Magellan arrived at Seville and found lodging with an expatriated Portuguese named Diogo Barbosa, governor of the arsenal, and one who had held his post for fourteen years and enjoyed a measure of popularity. I think that meeting was not fortuitous. I believe that Magellan was directed there by those with commercial interests at heart, and that Faliero was not to appear with his data until the time was ripe. Barbosa himself had sailed the seas, and his son Duarte had been in the India service and had written a book describing his voyages.

Within three months Magellan had married his host's daughter and Barbosa was in full possession of Magellan's plans.

Then there were diplomatic whisperings, wire-pullings, arrangements, and soon ears were gained in high places and the project in its bare outline was laid before the *Casa de Contractacion*, an office having to do with newly discovered lands, with navigation, with exploration projects and allied matters. The body heard, pondered, postponed consideration, and there, in the ordinary course, things might have ended. But one of that body was a Juan de Aranda who had made himself acquainted with as much as there was to be known, without Faliero.

Aranda had his correspondents in Portugal to whom he wrote before he took any steps. So there was much double-crossing, Magellan not holding true to his promises to his colleague, Faliero; Aranda in a measure acquainting his Portuguese correspondent with Magellan's secret, and in due course, when Faliero arrived on the scene, there were anger and suspicion. But with Aranda, business was business.

What is known at this stage comes from legal documents, for in time Aranda was called to a court to answer an indictment for having privately and illegally contracted with Magellan and Faliero to receive a part of the profits coming from the expedition, if the deal went through, for his services. To clear up ends without delaying the story, let it be said that he was censured and lost the money he had advanced to Faliero and Magellan. He had financed the two men up to 1,500 ducats, after he had written to those Portuguese friends of his. What he asked for was one-fifth of the profits, on condition that the King of Spain be persuaded to equip the armada asked for. Between the three there were hagglings and at the end it was agreed that he should get one-eighth.

*Aranda's Share in the Transaction*

Much has been said about Aranda's share in the transaction, and he has been praised for his altruism and public service. What he actually did was to supply judgment and to guide erratic enthusiasms. That he had an eye to his own ultimate gain is not to be denied. That he acted for others, one of those commercial organizations of which we have written as being extremely active, seems probable.

What actually came to pass through the management of Aranda was this. He procured interviews for Magellan and Faliero with his associates in the *Casa de Contractacion;* Sauvage, the Lord High Chancellor; Adrian, cardinal of Utrecht; the Bishop of Bruges. Then came an interview with the boy king, Charles V. But before the interviews, he produced a document which he had prepared, and which both Magellan and Faliero signed, by the terms of which he was to receive his percentage. It was executed on February 23, 1518.

The upshot of the interviews with the royal and the administrative bodies w: that Faliero and Magellan could eith fit out the expedition from their own purs and give a percentage, that was to be d cided upon, to the crown for the privileg or with the king financing they might sa as captains, invest an amount to be d termined upon in articles for exchange an barter with the natives, and look to th royal favor on their safe return to rewar them as it saw fit. To come down to har facts, as far as Church and State were con cerned, the expedition might go on the rock then and there if Magellan and Faliero wer not prepared with fiduciary obligations, s to speak. The adventurers could scent ou a new market if they chose, but at thei own expense. The high dignitaries woul bless the expedition at starting, and woul take the lion's share at the end.

*De Haro Offers to Help With Money*

Then came what some have counted as another of those fortuitous happenings, with a man, moved by great regard for the public good, stepping forward. He was well known to Master Aranda and offered to provide strong financial support. It was Christopher de Haro, of the commercial house of Antwerp. It was the same De Haro who had quarreled with the King of Portugal after seven of his merchant ships had been sunk. It was the same keen-eyed executive who had fitted out the expedition in which had sailed the man who wrote a pamphlet describing a strait similar to the Strait of Gibraltar. It was the captain of industry whose doings were strictly economic, an impassive man of affairs who had reports from his agents everywhere, east and west, north and south, in foreign courts and cabinets. And so the first step was taken that made possible the voyage round the world.

Certainly the part played in history by such men as De Haro has been overlooked too often by students and historians. Not an organized government, but commercial-minded men of self-reliance and energy and enterprise, who sought new markets, were the mainsprings of action. Established government did nothing. Political management was both reckless and careless. The actions of men in power were grotesque and ridiculous. But men of industrial activity were in another sphere altogether. Attached to such commercial houses as the Haros and the Fuggers and the Roths were men of intelligent activity, sober caution and trained judgment. For years they had gathered data, just as industrial and commercial houses and captains of industry gather data today. They had observed. They had kept their counsel. To be sure they were no whimsical speculators and they were no philanthropists. Business was business with them. They were out for trade expansion first, last and all the time, and their ways were simple and very efficient.

*Knowledge of a Strait Kept Secret*

Realizing all that, things seem to fit together with a click; the knowledge of a strait kept secret until the proper time; the student Faliero having access to the king's library; the withdrawal of the De Haros from Portugal and the presentation of the data and the proposition to Spain; the extraordinary interest in unknown adventurers taken by Aranda; the correspondence of Aranda with others at Lisbon; the strange protection that seems to have been accorded Magellan when he was absent without leave; and much more that is to transpire when Magellan had the reins of power.

# Who Pays for Our Radio Programs?

(*Continued from page 7*)

a big public service, for which the beneficiaries of that service are not paying a dollar directly to the distributors. It is estimated that the average investment in radio sets approximates $80. So the situation is this: the public have invested 400 millions of dollars in plant, with absolutely no assurance that they are going to get any return through their equipment. I know of no other public service in which the people have invested that amount of money in plant, without any assurance of its continued use. It's an eloquent example of the buoyant confidence of the American people in the future. Remember, there are 562 distributors of programs, from the fellow who is operating a very small outfit, to the corporation operating a very large one; yet the millions that the public have spent for equipment, with few exceptions, haven't gone at all to the broadcasting stations which are serving them."

The "exceptions" to which the speaker referred include what is known as the "radio group," consisting of two large manufacturers of electrical equipment (the General Electric Company and the Westinghouse Company) and a radio corporation (the Radio Corporation of America). The first two companies manufacture radio equipment, and the third sells it. These three corporations own and operate nine broadcasting stations, and while others have been selling their facilities, they have been providing them at their own expense, due to the indirect return they obtain from the marketing of radio receiving sets.

But, according to an officer of the radio corporation, the latter has recently changed its attitude by establishing a commercial branch. "We weren't paid for our radio broadcasting," he said, "and it never did pay us. So last July we reached the conclusion that the business concerns utilizing our facilities ought at least to pay for the expense of putting on the programs. Since then we have put on a commercial department, to which business firms pay the cost of performers, both vocal and instrumental. These concerns receive the indirect advertising benefit accruing from the broadcast announcement 'This program is given through the courtesy of John Smith & Company.' The programs of the corporation originate for the greater part in its studios in 42nd Street New York, whence they are sent by wire to its super-power station, WJZ, at Bound Brook, New Jersey."

Meanwhile, the question still remains, "Who pays for the elaborate radio programs that are broadcast daily?" The answer is that the expenses are borne by business companies, and more especially by the large corporations more familiarly known as national advertisers. An example of the method pursued is best shown by the operation of WEAF, which is the largest program distributor in the country (and is conducted by the American Telephone & Telegraph Company). This enterprise is a purely commercial proposition, for the corporation which manages it obtains no return from the manufacture of radio receiving sets, its manufacturing subsidiary (the Western Electric Company) being engaged only in the production of broadcasting sets, which are sold to the independent stations.

WEAF occupies about 10,000 square feet of floor space on the fourth floor of the large office building at No. 195 Broadway (the American Telephone & Telegraph Building) and employs a force of about 100 persons in its broadcasting work. Half of this space is devoted to studios, in which sixty to seventy per cent of its programs are originated. About 1,000 professional players and vocalists are put over every month as entertainers. Dance music is "picked up" outside, from hotels and large musical organizations. WEAF has a local service, and operates also through a network of seventeen broadcasting stations located in fifteen cities, all of which are east of the Missouri River. It does not broadcast beyond this limit at present, due to the insufficiency of wire facilities in the West.

Decorative corner of reception room at Station WEAF.

WEAF charges the national advertiser first for the expense of putting on his program, and then for the cost of distributing it. The charge for putting on a program depends entirely upon its artistic merit or excellence. Program costs run from $300 an hour to as much as the national advertiser is willing to stand for. One large corporation (the National Carbon Company) which manufactures a certain type of battery, pays from $1,000 to $1,500 an hour merely for its performances. It puts on large grand orchestra groups of vocalists and popular actors, and when performers of the type of John Drew are engaged, the charges are still higher. One manufacturer of radio sets (Atwater-Kent) pays for his casts as high as $2,500 an hour. As stated before, these expenses are for talent alone, and do not include the costs of broadcasting.

The payment for the use of facilities of stations like WEAF depends upon the number of additional stations through which the programs are broadcast. WEAF, used only as a local station, charges a maximum rate of $600 an hour for broadcasting; but when it broadcasts a program over its network of fifteen cities, the charges run to about $3,000 an hour. So it can be seen that a national advertiser, or in other words a company that has a nation-wide sale of its product, often spends as much as $5,000 or $6,000 an hour in originating an ambitious program and having it broadcast through the country. Its only compensation is the indirect advantage of having its company name or the name of its manufactured product mentioned as being sponsor for the program. This form of advertising seems to pay, however, for the larger manufacturing concerns now plan their advertising appropriations to cover the three fields of newspapers, magazines and radio broadcasting.

Broadcasting, in fact, is a new advertising medium, and the national advertisers are the basis of its support. The cost figures mentioned apply, of course, only to the larger stations which are in a position of putting on programs of high merit, in which only professional entertainers are engaged and a standard of artistic excellence is maintained. Certain forms of business enterprise lend themselves more readily than others to particular types of programs. In selecting a pair of black-face comedians to advertise a brand of laundry soap (the Gold-Dust Twins), comedians who have gained wide popularity throughout the country, more than a dozen actors were tried out in their parts before the popular "twins" were found acceptable.

Large stations have their own selling forces; their salesmen submit prospective programs to the advertising managers of business concerns, quoting the rates charged for putting on the various forms of entertainment. There are, however, scores of smaller stations, whose rates are lower and whose programs are far less expensive. Some enterprising broadcaster makes an arrangement with a hotel, which agrees to supply him with a headquarters for his studios and transmitter; the hotel gets its return out of the ensuing publicity, in which its dining-room and ballroom concerts are broadcast. Salesmen for stations of this type, who seek commercial clients, as a rule get whatever they can contract for in the way of payment. They have all kinds of scales; they may ask $250 an hour at the

start, and finally clinch the bargain for $50.

The elaborately furnished studios, in which programs are developed and auditions or tryouts are given to vocal or instrumental performers, are as a rule situated many miles from the broadcasting headquarters, to which the developed programs are dispatched over a special wire. The broadcasting station, in turn, wires its programs to other stations in distant cities, with which it operates under special contracts. In this way broadcasting incurs an additional expense; it is necessary to use long-distance wires, from which all telephone and telegraph equipment is temporarily stripped; special equipment is then substituted for music transmission. These long-distance wires have to be modified and changed throughout their length for broadcasting purposes, since the ordinary telephone circuit cannot be utilized for broadcasting. Telephone circuits designed for transmitting the voice have a pressure of from 20 to 500 cycles, while music requires at times from 40 up to 10,000 cycles. Before a program is transmitted, it takes an hour or two to install these changes, and also takes a couple of hours afterward to restore normal conditions on the wires.

***Why Preachers Must Pay for Broadcasting***

Broadcasting stations are quite often criticized for demanding money for sending out sermons or educational programs; in one instance several hundred dollars was asked of a church in Philadelphia for broadcasting its services. The manager of one of the stations explained that the charge was probably brought about by the necessary cost of reaching the church with wire facilities, and there is both operating expense and wire expense in broadcasting.

The larger stations in New York City, in their study of the problem of sending out church services, early in the situation concluded that it would be the best thing to refuse to put on the services of a single church, since they would then be accused of serving only one church or one denomination. They also decided that it would be a poor policy to send out any religious program at hours other than when the church meeting was held, as they might be charged with keeping persons from church. An exception was made in broadcasting Dr. Cadman's men's conference in the Bedford branch of the Y. M. C. A., Brooklyn, because of its non-controversial character.

No charge is made for broadcasting Dr. Cadman's Sunday lectures which have been sent out for the past three years. WEAF officials say it costs them $200 a week for picking up the Bedford wire, and at first they split the difference with the Y. M. C. A., charging them $100 a week; but this charge was discontinued a year ago.

Then the broadcasting interests put the situation up to the three principal religious groups of the city, Protestant, Catholic and Jewish. The Cathedral, the Federation of Churches and the United Synagogues were asked to take the responsibility of preparing religious services representing the various groups. This they were asked to do in rotation. The broadcasters then provided the religious bodies with the facilities of their studios and stations free of charge.

# The Man Who Fights Alone

(*Concluded from page 4*)

life sentences, would mean fewer murders.

In giving statistics on the number of policemen slain, we have not included those killed accidentally. To do this would boost the figures at least three times. Many are killed in automobile accidents while pursuing criminals; others die in fires, in other catastrophes.

The policeman's lot is not a happy one. He must risk his life to save the lives of citizens. Richard E. Enright, the man who rose from the ranks to be Police Commissioner of New York, gives us a vivid description of the life of a policeman:

"The cop is the world's greatest warrior. He is the valiant fighter supreme.

"The reason? It is simple. He fights alone!

"The soldier of peace is a hero real or potential, as brave and valiant as any soldier who makes his sacrifice upon the field of battle.

"The soldier of war fights as a part of great units; he fights under the eye of his commander; he fights an enemy whose position and potential powers are known. When the crisis arrives, he goes forward with comrades at his side to the accompaniment of the wild, grand music of war as in his patriotic fervor he embraces the opportunity to fight and, if necessary, to die for his flag and his country.

"But the soldier of peace fights alone; often he does not know his enemy, his position, or his power. He fights his battles alone in the waters of the harbor, in the cellarways, the alleyways, on the roofs, and in the dark and noisome places of the city.

"For the cop there is no comforting feeling of fellow fighters at his side, no joint action with others—a thing that gives mental, spiritual, physical support. He is mentally, spiritually and physically alone. The cop faces surprise, ambush, with no knowledge of the powers ranged against him.

"He fights the unknown—alone!

"And the cop does not fight under the eye of his commander—of many commanders. Not for him is the immeasurable aid of the cheering voice, the overseeing eye, the chieftain's presence. The cop must be his own commander, must cheer himself on, furnish his own grit and backbone. He fights alone—at once the chieftain and the follower, the planner and the doer.

"And mark you this! For the cop there is no retreat, no surrender, no armistice!

"He can't quit—he must go on. No retirement to other positions is possible for him. No readjustment of forces is within his scope. He fights alone and must fight without hope of quarter or of mercy. He cannot save his life by a cry of 'Kamerad.'

"For him there is but one issue! The cop must conquer or fall. He cannot surrender. It is his life or his antagonist's.

"He fights alone!

"Macaulay in his *Lays of Ancient Rome* honored brave Horatius who held the bridge. Such a post is the cop's. Oh, that we had a mighty poet to chronicle the deeds of such as he.

"Holding the bridge for your life and mine against a myriad of foes, he is that greatest of warriors, an American cop.

"He fights alone!"

# About That Joint Deposit

JOHN HENRY CAMPBELL'S funeral was over, and Peter Campbell, a brother of the deceased, was walking back from the cemetery with the local busybody.

"I suppose John Henry left quite an estate?" the seeker after information suggested.

"Enough, but none too much," Peter Campbell assured her.

"Leave a will?"

"I haven't seen Squire Kelley yet, but don't fancy there was any."

"Then, in that case, I presume that deposit certificate in your name and John Henry's will fall to you?"

"You knew about that, did you?" Peter Campbell queried, skillfully concealing the fact that this was the first intimation he had had that such a document existed.

"Oh, yes, I was there when John Henry took out the certificate," was the ready reply. "He went up to the cashier of the rural bank, handed over $5,000, and told the cashier to give him a deposit certificate in your name and his, payable to either one of you six months after date. I didn't mark down the day of the month, but as near as I can figure it the certificate was payable yesterday."

The next day Peter Campbell called at the rural bank and ascertained that a joint deposit certificate had been taken out in the names of himself and his deceased brother, and that it was still outstanding.

"I presume you will pay the principal and interest of the certificate to me," Campbell suggested. "According to your statement, it's payable to either of us, so there would seem to be no doubt about my right to receive the money."

"We have been advised that when A takes out a joint deposit certificate in the names of himself and B, they are not partners, and the money deposited belongs to A. Therefore B is not entitled to demand the money after A's death," the cashier declared.

"On what ground?" Campbell demanded.

"On the ground that the deposit certificate is really nothing more than a power of attorney authorizing B to draw the money, which, like any ordinary power of attorney, is revoked by A's death," the cashier explained.

"I'll sue the bank if you don't pay," Campbell threatened.

"Then you'll have to sue, for the bank certainly will not pay until the court so orders," the cashier announced.

Peter Campbell did not sue, however, and thereby saved time, money, and court costs, as the Supreme Court of South Carolina in a case reported in 117 Southeastern Reporter, 312, has ruled that a joint deposit certificate, taken out under these circumstances, is not payable to the survivor after the death of the depositor.

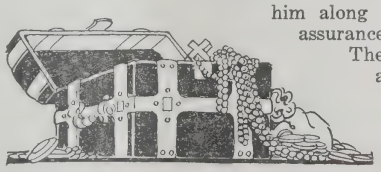
"The bank's mere correlative agreement cannot of itself keep the power so conferred alive; it died with the donor," the court's decision declared.

# Captain Kidd—Pirate-Catcher

(*Concluded from page 8*)

Earl of Oxford, First Lord of the Admiralty, and two titled secretaries of State. Among them, 6,000 pounds was subscribed to purchase and fit out the *Adventure* galley, 287 tons, and carrying 34 guns. Bellamont also secured from the King a special commission in which Kidd is exhorted to "serve God in the best manner you can." There are explicit instructions regarding "Prizes, Treasures, and Merchandizes," and the Governor concludes, "I pray God grant you a good success and send us a good meeting again."

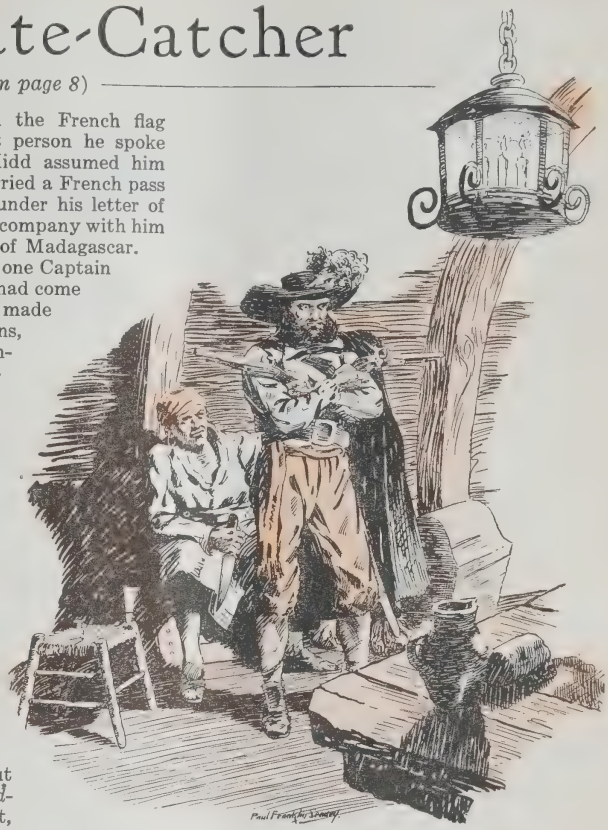
With this elaborate document, Kidd set sail from Plymouth, England, bound for New York where he posted articles to increase his crew. These were to be taken on by the "no purchase no pay" plan, "purchase" being the polite word for booty. Of all the treasure taken from pirates, one quarter was for the crew, the remainder to be divided into five shares, one of which should belong to Livingston and Kidd, the rest to Lord Bellamont and his friends.



With a crew of 150 men Kidd sailed out of New York in September, 1696, to be gone three years. He touched at Madeira and the Cape Verde Islands, and then continued to Madagascar. But all the pirate vessels were off about their affairs, so he sailed back and forth in the vicinity of Johanna and Malabar, but took no prizes. During this long period of cruising, about a year, he met plenty of rich Indiamen but he did not molest them.

Then he sailed to the mouth of the Red Sea where he forced the natives to give him some corn. His prizes had been negligible, his crew without pay, and his ship constantly in need of repair.

"Courage, my boys," he is reported to have said to his men, "we have been unsuccessful hitherto, but we'll make our fortunes out of the Mocha fleet."



This may have meant, as Kidd averred, that pirates would be likely to prey upon the vessels and he, in turn, would attack them. When the fleet did appear, a dozen or so ships convoyed by two men-of-war, there was some little firing, but Kidd claimed they opened on him. At any rate, the *Adventure* withdrew and there were no prizes.

The temper of the crew was by no means bettered by this failure. Their number had been decreased by accident or desertion, the ship was leaky, and the prospects few. Kidd did make one or two small seizures, the most important being a Moorish ship sailing under a French pass which made her a lawful prize under his commission of reprisals. In case of the other vessels, Kidd claimed that he was forced by his crew who were openly rebellious. About that time they came up with a Dutch merchant, and, as was admitted at the trial, the men clamored to attack her, but Kidd absolutely refused. In an altercation with his gunner, Moore, hard words were passed. Kidd picked up a bucket and hit him over the head, and Moore died the next day.

Shortly after this unfortunate incident, Kidd made his only capture of value. This was the *Quedagh* merchantman, an Armenian-owned ship plying between Surat and Bengal. As was customary with privateers, Kidd hoisted the French flag to decoy her. The first person he spoke with was French and Kidd assumed him to be the master. She carried a French pass which made her a prize under his letter of marque, so he took her in company with him and sailed for the Island of Madagascar. Here Kidd was visited by one Captain Culliford who asked if he had come to hang them all. Kidd made him a present of provisions, but, considering the number of pirates in the colony, that is not surprising. Moreover, a good number of his crew deserted to the pirates, which ought to have shown the jury that their opinion of their own captain in that capacit was not very high.

With armament transferred to the *Quedagh*, for his own ship was no longer seaworthy, Kidd started for home, touching at the Dutch spice islands where he learned that there was considerable talk in England about the activities of the *Adventure*. As a matter of fact, the East India Company had complained of Kidd, there had been an investigation of his somewhat irregular commission, and Bellamont, in an attempt to clear himself of suspicion, had induced the King to proclaim a general pardon to all pirates who voluntarily surrendered, Kidd and Avery excepted.

Captain Teach or Blackbeard, honest-to-goodness pirate.

Quite unsuspecting of this royal distinction, Kidd continued on his way. Arriving off New York, he sent for Emmott, a friend who specialized in admiralty cases, and sent him to Bellamont to see how the land lay. He also gave him the two French passes which proved his seizures legal. Bellamont received Emmott in the fine brick dwelling which later became the Province House. After discussing the matter at some length, he called for Duncan Campbell, the postmaster, a Scotsman like Kidd and an old acquaintance, and sent him along with Emmott to carry assurance to the perplexed captain. They sailed from Boston in a sloop on June 17, 1699, and found Kidd off Block Island. They bore a friendly letter from the Governor, but Kidd did not think it prudent to bring his treasure into harbor, so he lay off Gardiner's Island, near the eastern end of Long Island; while small boats carried the booty ashore and his men buried it. Then he sent for the owner of the island and asked him to take charge of some goods intended for the Governor.

Kidd's wife joined him here and they proceeded to Boston where Kidd asked leave to prepare his report in writing. Bellamont agreed, but at the same time got out papers for his arrest. It chanced that the constable who served them met Kidd in front of the Province House, and the Captain dashed up the steps and took refuge in the Governor's study. That must have been the moment when he realized how frail is the friendship of princes. Kidd was placed in the goal on Court Street, on the site of City Hall, in irons weighing sixteen pounds and the sheriff given forty shillings a week above his salary for strict watching. On February 6 the *Advice* arrived and Kidd was taken aboard.

In England Kidd was kept in goal a year, then brought to trial for assault on William Moore. In vain he protested that to strike down a mutinous sailor was no crime; the verdict was murder. Then the charge of piracy was brought forward and Kidd asked that his passes be produced, but they were nowhere to be found. Parliament was preparing to impeach Somers and Oxford and the trial was farce to cast dishonor on them. Kidd was pronounced guilty and sentenced to be hanged. When asked if he had anything to say, he replied:

"My lord, it is a very hard sentence. For my part, I am the innocentest of them all, only I have been sworn against by perjured persons."

On May 23, 1701, he was hanged at Execution Dock, then his body was put in chains and gibbeted near Tilbury Fort, on the lower reaches of the Thames, where it swayed for years, a memorial to the fickleness of justice.

Just why Kidd's fame should have grown so mightily is a mystery, except it be for the prominence of those who set the ball rolling. Happy is the place that has a memento of him. New York preserves a print of his house on Pearl and Hanover streets, Boston points out the room in the Old State House where he was examined, and Newport shows us the exact spot where he lived.

# Chats with Office Callers

"I see by the papers," said ***The Man from the Next Room,*** "that a clergyman has stated that men believe less in immortality than they used to. That is hardly the way to put it, according to my mind. There is probably more *thought* expended on the question than ever before, and there is probably more *confidence* felt with regard to it. Immortality is, simply, the superiority of life over what we call death. We do not properly know what death is. No one has ever seen it. All that we are able to see is the refuse, the debris, which death leaves behind. The body, the grave—these are not death; these are the things which death had no use for. As to the body, we know that it is not dead; it very livingly runs back to its sources. We have never found a point anywhere where life is nonexistent. Death is an experience in life, which we understand very little. In older days men did not have a very high conception of the life they lived on earth, and their instinct for life moved them to contemplate what may be awaiting us in the next stage. Thus they dwelt largely on immortality. Nowadays we appreciate present life, we are living a more abundant life, and we find this stage of life so full and rewarding that we are not so greatly bothered about the next stage. We know that it will come in its course. We have confidence that as the conditions of this stage of existence were arranged for our growth, so will the conditions of the next stage be. Life in all its stages is a personally conducted journey and what we call death is one of the entrances to further experiences. People are not so afraid to die as once they were. This in itself is a sign of the genuine confidence with which men accept the order of life and death, and in my mind it signifies faith of the truest sort."

"The greatest effect of theatrical art I ever witnessed," said ***The North Carolinian*** as we discussed the Color Question in the South, "was one night in the town where the plot of Tom Dixon's *Clansman* is laid. The courthouse of that story is just across the street from the theater where the play was being given. The actor who represented the negro carpetbag governor was trying to force the white heroine to marry him by threatening her with the death of her father. Tense and more tense grew the situation until the girl was forced to her knees. At just that moment, in the play, the rifles of the Federal soldiery are supposed to be poked through the window and the girl saved. But something else was occurring which was not on the bill. From somewhere back in the audience a big Carolinian was striding down the center aisle with a long .45 in his hand, trained on the actor. He got down to the orchestra bar just as the Federal rifles appeared at the window. He took in the situation. The actor saw him and was cowering more than the mere sight of the play rifles of the actor soldiers called for. There was commotion all over the theater. 'Never mind, boys,' called out the interloper, 'if they miss him, *I'll* get him!' And he held his gun on the actor. That night the actor washed the black off his face and resigned his job. It was too realistic for him. He never played that part in the South again."

ɛ ɛ ɛ

"This town," said ***The Companion of the Journey*** as our car slowed up through a certain small city, "was promised a position as leader in tobacco marketing if it followed Aaron Sapiro's advice. It followed the advice, and you may judge from its appearance what happened. See those two tobacco warehouses? Empty and for sale. Yonder is the newspaper office: the editor had to seek work in another town. Most of the buildings down this street contained businesses which have now failed; the merchants are looking for jobs to make their living. Those groups of men are the ruined victims of a false economic theory. The town is dead. In his speech here, Sapiro said he would make this town the tobacco center of the United States, and that Z——, another town a few miles distant that resisted his false magic, would have grass growing in its streets. It all came out the other way: Z—— is now the greatest tobacco market in the country. You people up North read these things as matters of print, but down here you can trace their effects in men's lives. The worst of it is that there are still people here who do not know what caused their downfall. They are ready for the next faker that comes along and promises to work a magical golden millennium for their benefit."

ɛ ɛ ɛ

***A Man from Southern California*** had just come in from Miami. He had nothing but praise for the climate of the southern state and nothing but condemnation for the realty exploitation of Miami.

"Miami," he explained, "is a wonderful city. Values there are in for a readjustment. Next year we expect to see property values there at a level with similar property in other cities. They have been asking from $50,000 to $60,000 for single lots that are worth no more than $10,000 at the utmost considering their earning power, location and true value."

I asked him how he liked Florida compared with California.

"In my home town near Pasadena we are an hour from the seashore and an hour from the mountain tops. At all seasons of the year you will find snow on Mt. Baldy from five to six feet in depth. Big Bear Lake, in the San Bernardino district, is cool in summer. We have all conditions from sub-tropic at the seashore to alpine in the mountain tops. Florida cannot boast of such a climatic variation. But the land of sand and sunshine, and I mean by that Florida, is a beautiful place and will some day support a population far in excess of what it has now."

"Who is going to be the next President?" I asked ***A Man from Washington.***

"Hoover," he replied.

"Now I know that you're not a prophet," I remarked.

"I am not saying whom I want to be President; I am only telling you whom the next President is going to be," said he.

"The next President, or the next candidate?" I persisted.

"The next Republican candidate will be the next President," said he. "What have the Democrats got to offer?"

"No doubt you're right on that," said I, "but what will Mr. Coolidge be doing all the time?"

"Mr. Coolidge will have no more to say about it than he had before. Do you know who is the real President of the United States today?"

"No, do you?"

"Certainly. Your Uncle Andy Mellon is. Colonel House in all his glory never wielded so much power as Andy does now. Everybody in Washington from the President down is afraid of him. You have no conception, unless you are on the inside, how Mellon has them all in fear. And unless something happens to break his hold, he will name the next President, and it will be Hoover."

"The country will not take Hoover," said I.

"The country will have no say in it," he concluded.

ɛ ɛ ɛ

"And we call *him* a savage," said ***The Poet,*** "and *ourselves* civilized." He was telling of Hi-he-come-I-go, Indian of the Northern Michigan woods, fire guard, game warden and caretaker on The Poet's land. "One morning," he continued, "I came upon him clearing a path through the trees. Beside him was a mound on which some Indian pipe was growing, some of it creeping over the trail. Hi-he-come-I-go grunted as I came up, and then pointed to the plant: 'Me keep it. Other people like it.' And *that's* the man we call a savage! leaving a flowering shrub alongside a path because someone else might come along and like it. Why, if you should turn loose one small Sunday school picnic on my land, they would wreck it inside of two hours. Frankly, I would rather have a swarm of locusts descend out of the skies then to have a Sunday school class come whooping along the road toward my land; the locusts would do less harm! And why in the name of Heaven must motorists pick every flower they see? They end their usefulness and fragrance and delicacy. The flowers wilt and die and are discarded before the beauty-snatching visitors are halfway home—and yet they are as likely as not to jump out and pick new flowers while they are throwing the old ones away. Why can't our *civilized* tourists follow the example of our *savage* Indians?"

# When Old Salem Hunted Witches

(*Continued from page 2*)

Danvers. Tradition tells us that in the winter of 1691-92 his nine-year-old daughter Elizabeth and a niece, Abigail Williams, age eleven, used to gather with some of the neighborhood children in the kitchen of the parsonage to be entertained during the long winter evenings by Tituba, a half-Indian, half-negro servant. These children took to practising the strange tricks and incantations with Tituba. Among the assembled children was twelve-year-old Ann Putnam, daughter of Sergeant Thomas Putnam. This small and irresponsible person, together with her passionately jealous mother, gave most absurd testimony at many of the witchcraft trials that followed, with tragic success; the father and husband of these two women unquestionably had much to do in preparation of the testimony they gave.

***Children Make Terrible Accusations***

Tituba found apt pupils to learn the tricks and jugglery, practiced by the semi-barbarous races, which she had brought with her from the islands where Mr. Parris had counted her as one of his slaves; and in due time the girls began to act in a most unusual manner by getting into holes and creeping under chairs and stools, using sundry odd postures and antic gestures, all the while uttering foolish speeches of which neither they themselves nor any others could make sense.

Their elders learned something of what was happening. Great was their consternation when the village doctor, Griggs, who, evidently feeling obliged to give some name to the disorder, pronounced the girls bewitched. The children, probably realizing if the exact truth were known they would be severely punished at home and even publicly disciplined in church, agreed to the physician's diagnosis. Not for a moment did they realize the terrible consequences which were to follow.

Commanded by their elders to tell who had "afflicted" them, they named Tituba, Sarah Good, and Sarah Osburn. Complaints were issued and the arrests made. The examinations were to have been held in the village tavern, the house of Lieutenant Nathaniel Ingersoll, but so great were the numbers who came to witness the proceedings begun March 1, 1692, that the court adjourned to the meetinghouse instead. Sarah Good, aged seventy, wife of William Good, "laborer," was examined first.

All testimony at these trials or examinations brought before the local magistrates was taken by persons intensely prejudiced against the prosecution. Much of it was written down by Parris himself, and as he was very often the leading prosecutor, the reader can easily understand why the testimony recorded is more apt to be against the accused than otherwise. A brief insertion of the opening of the examination of Sarah Good is herewith given, it being characteristic of all the examinations:

***What Happened at the Trial of Sarah Good***

Sarah Good, what evil spirit have you familiarity with?—None.

Have you made no contracts with the devil?—No.

Why do you hurt these children?—I do not hurt them. I scorn it.

Who do you employ, then, to do it?—I employ nobody.

What creature do you employ then?—No creature; but I am falsely accused.

Why did you go away muttering from Mr. Parris's house?—I did not mutter but thanked him for what he gave my child.

Have you no contract with the devil?—No.

Hathorne desired the children all of them to look upon her and see if this were the person that hurt them, and so they all did look upon her and said that this was one of the persons that did torment them. Presently they were all tormented.

On March 7, the three women, Goodwives Good and Osburn and Tituba, were sent to jail in Boston. There Sarah Good remained until May, when the grand jury presented an indictment against her charging her with practising the art of witchcraft. There was the ridiculous testimony of the children, including young Ann Putnam, and that of Henry Herrick who said that Goody Good had come to his father's house for lodging, been refused, and upon being forbidden to sleep in the barn she replied that it would cost his father one or two of his best cows. Jonathan Batchelder added to this that, about a week after, two of his "master cattle" were removed and younger cattle put in their places, and since then several cattle had been let loose in a strange manner.

Strangest of all court records, as regards age, is that coming from the five-year-old daughter of the accused. Little Dorcas Good got up on the stand and declared that her mother "had two birds, one black, one yellow, and these birds hurt the children and afflicted persons." Files show that later this child, scarcely more than infant, had three depositions brought against her as being a witch. Ann Putnam, little more than twice the age of Dorcas, testified that "the apparition of Dorcas Good came to her, bit her, pinched her and afflicted her most grievously, also almost choking her and urged her to write in a book." The child was committed to prison but not executed. Her mother was convicted and sentenced to be hanged July 19. Reverend Noyes said to her, as the woman stood on the scaffold, "You are a witch and you know you are a witch."—"You are a liar," was her indignant reply. "I am no more a witch than you are a wizard, and if you take my life, God will give you blood to drink."

***A Man, a Dog, a Hog, and Two Cats***

Next to be tried was Sarah Osburn, a woman about sixty years old, who with her third husband was a member of the church and as far as we know both were sober, industrious citizens living on a productive farm. However, when Osburn came to manage the widow's farm prior to their marriage there had been some gossip of an uncomplimentary nature, and this undoubtedly was one of the inducements for the accusing girls to "cry out" against Goodwife Osburn among the first. Her examination was very nearly a repetition of the proceedings in the case of Sarah Good, but she died in the Boston jail. The mental strain of the examination, together with the brutality to which all those accused in New England were subjected, proved fatal to this feeble old woman who had been very ill in late years.

As for the servant, Tituba, it is often believed that her master, Reverend Parris, made her confess to be a witch to save from scandal his own household. She was asked in her examination what sight she saw when flying abroad, to which she replied: "I saw a man, a dog, a hog, and two cats, a black and red, and the strange monster was Osburn's that I mentioned before, this was the hairy imp." She further declared that she went on witch expeditions with Goody Good and Osburn. Committed to prison she lay there for thirteen months after which she was sold for prison fees.

Another woman living in what is now Danvers was taken into custody twelve days after the three above mentioned had been sent to jail. She was Martha Corey, wife of Giles Corey, and one of those who from the beginning had denounced the whole proceedings, although her husband was at first completely carried away with the storm sweeping over the rural community. Corey was eighty years of age; his wife, not more than sixty. Goody Corey was a woman of more than average judgment and discretion and it was due, no doubt, to her scorn of the witchcraft meetings that suspicion was aroused that she was in league with the devil. Her name whispered about by those young girls of the accusing circle was sufficient cause for the sheriff's investigation. It was Ann Putnam, the mere child, who gave the court its first cue.

***Said Goody Corey Was in League With the Devil***

The examination of Martha Corey was a sample of cross-examination and browbeating on the part of the magistrates which finds parallel only in the conduct of some ungentlemanly shyster lawyer of a type now seldom seen. At one time during the examination the accusing children cried out that "a man" (the devil, of course) was whispering in Goodwife Corey's ear. The magistrate asked, "What did he say to you?" The accused replied, "We must not believe all these distracted children say." Parris, who reported the trial, says, "It was noted when she bit her lip several of the afflicted were bitten. Also, when her hands were unfastened the afflicted were pinched."

During the trial a Mrs. Pope threw her muff at the prisoner and later pulled off her shoe and threw it, striking Mrs. Corey's head. This Mrs. Pope was an important witness in many cases, but later acknowledged her error and deplored the whole business. On September 10 Mrs. Corey was convicted, and twelve days later was executed.

The case of her husband is, in some respects, the most interesting and tragic in all this awful drama of witchcraft. Giles Corey was examined April 19 in the meetinghouse of the village. The accusing girls conducted themselves in the usual manner and were so badly afflicted "with fits and troubled with pinches" that the court ordered Corey's hand tied. Brought before the court in September, the old man refused to plead to an indictment for witchcraft and "stood mute," as the law terms it. The English law of those days for "standing mute" was that the prisoner "be remanded to a low dark chamber and have placed upon his body as great a weight of iron as

***Giles Corey Refused to Plead***

he could bear, and more, that he have no sustenance, save only on the first day, three morsels of the worst bread, and on the second day, three draughts of standing water that should be nearest to the prison door, and in this situation this should be alternately his daily diet till he died, or—as anciently the judgment ran—till he answered."

The most prominent figure in all the witch executions of the village, as the years have carried it down to us, is unquestionably that of Rebecca Nurse. To read in detail the sad ending to her history is heart-rending. She died a saint and a martyr, and no slur on her character has ever been discovered. She was born in England in 1621, making her 71 years old at the time of the witchcraft troubles in the village, where she lived as the wife of Francis Nurse and the mother of eight children on the large farm of 300 acres which her husband purchased from John Endicott, whose father, the famous governor of Massachusetts, had given it to him. No more prosperous, happy and contented family dwelt in the village now known as Danvers than the Nurses. The father had been prominent and honored in the community in which he had dwelt; the mother was an intelligent, pious, devout woman, a veritable "mother in Israel." Against the good and fair name of Rebecca Nurse no breath of suspicion had yet been uttered.

There had, however, been some trouble over the boundary line of the Nurse farm with Zerubabel Endicott in which Nathaniel Putnam became involved. Later there were feuds over the lands on which the village of Middleton now stands, but which in those far distant times were a part of the present town of Danvers. Nurses were on the opposing side to the Putnams. However, all this had happened thirty years prior to the witchcraft affair. No one knows, no one will ever know, the real reason for the issuing of the complaint against Rebecca Nurse. Probably it was the wicked whim of Mrs. Ann Putnam, since her husband's complaint against Goody Nurse was for "vehement suspicion of having committed sundry acts of witchcraft" upon his daughter, Ann Putnam, and Abigail Williams. Rebecca Nurse was convicted and sentenced to be hanged. To this sentence the governor granted a reprieve, whereupon she was excommunicated from the church, which in those days people took to mean expulsion from heaven. What then must have been the unspeakable woe of this woman as she stood in the presence of the church she loved and to which she had been faithful for more than half a century, with the iron chains of a witch clanking about her withered and tottering limbs? With the reprieve came renewal of clamors from the afflicted. The governor finally recalled his good act and on July 19, on Gallows Hill

*A Closing Scene on Gallows Hill*

"They hanged this weary woman there,
Like any felon stout;
Her white hairs on the cruel rope
Were scattered all about."

In all countries, children were as a rule leaders in accusing persons of being witches. Shorn of the testimony of children, witchcraft trials would not have been kept alive for a single day in 1692. What motives prompted these children we do not know, can never know. It may be they were carried away by the importance in the community which their statements gave them; or they may have been the victims of the same mental derangement that afflicted the older people.

# A Dance A Week

HULL'S VICTORY—Metronome 112. Six couples in each set.

First, third and fifth couples begin the dance. Call the first change before the music begins. When each couple arrives at either end of the line, they wait during one repetition of the dance.

First two give right hands across, and balance in line ..... 4 bars

Head couple join right hands across, and turn half around. Still retaining partner's right hand, the gentleman joins left, with the left hand of the lady on his left, and his own partner joins her left hand with the gentleman on her left. They are now standing four in line, crosswise of the set. The two ladies facing up the set, and the two gentlemen facing the opposite direction.

Turn with left hand ..... 4 bars

The same two gentlemen turn the lady on their left, with left hands.

Right hand back and balance ..... 4 bars

The leading couple join right hands and turn once around, give left hands to same lady and gentleman as before, and balance four in line.

Turn with left hands ..... 4 bars

The same two gentlemen turn the lady on their left, with left hands.

Down the center and back ..... 8 bars

The first couple cross hands, chasse eight steps down the center, turn half around, return eight steps to the head of the set, then separate, each going below one couple. They are now standing below the first couple.

Right and left ..... 8 bars

The dance is continued until all have gone through the movements.

To end, call,—Forward and back, swing partners, promenade to seats.

LADY WALPOLE'S REEL—Metronome 112. Six couples in each set.

Call the first change before the music begins. Every other couple cross over, lady and gentleman exchanging places. All will then dance at the same time. Each couple upon reaching either end of the set, will cross over, and wait during one repetition of the dance, then continue as before. They are now back in their original line. The dance will continue until the first couple are back in their original place. The prompter then calls—All join hands forward, turn partners, promenade to seats.

Every other couple cross over and balance ..... 4 bars

The above couples cross over, exchanging sides with their own partners, face new partner, and balance.

Swing new partner ..... 4 bars

Take waltz position, and swing once around.

Down the center and back, cast off ..... 8 bars

Couples cross hands, chasse eight steps down the center and back, and go below one couple.

Ladies chain ..... 8 bars

Two ladies give right hand across; walk half around; give left hand to opposite gentleman; turn; give right hand back to same lady; return to place; give left hand to partner and turn.

Half promenade ..... 4 bars

Cross hands, and chasse to opposite side of the set.

Half right and left to place ..... 4 bars

Repeat all. Balance to the next couple below each time.

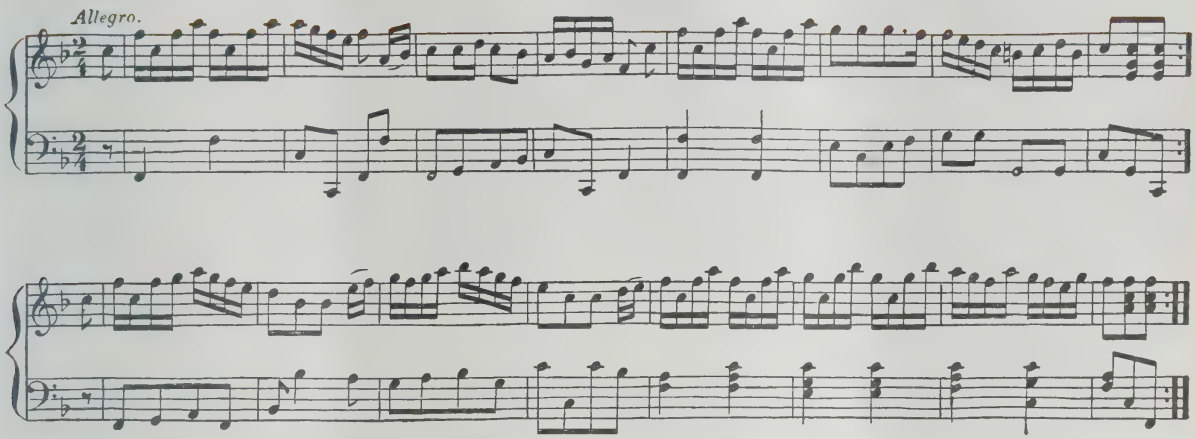
SPEED THE PLOW—Six couples in each set.

Every other couple cross over. Give first call before the music begins. First lady balance to first and second gentlemen, 4 bars; Circle three hands around, 4 bars. First gentleman balance first and second lady, 4 bars; Circle three hands around, 4 bars. Head couple down the center and back, 8 bars; all right and left, 8 bars.

Head couple "cast off" or go below next couple and repeat from beginning.

---

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.



Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Please order by number.

# World War's Effect on the Negro

(Continued from page 15)

Those of the race who remained in the South did not drop back into the old pre-war meekness. Servants found eating at the dining table merely grinned if discharged.

the folks at home, who had become very close together and very democratic through war work and anxieties, saw between the black soldier and the white soldier none of that spirit of fellowship and quiet understanding that usually exists between men who have together suffered and struggled and looked into the face of death.

Finally the black soldier, unable longer to restrain himself, began to talk and to boast. He crystallized the rumors with an admission.

Only those who are of the South can understand what this admission meant. Only the future can check up the cost in the race situation. If the outsider sees in them only an absurd sensitiveness on the part of the white race over a quite natural bit of byplay on the part of the negro soldier, then that person is incapable of understanding even the outer edge of the race problem, to say nothing of the gigantic forces down here that ever hang on a knife-edge balance.

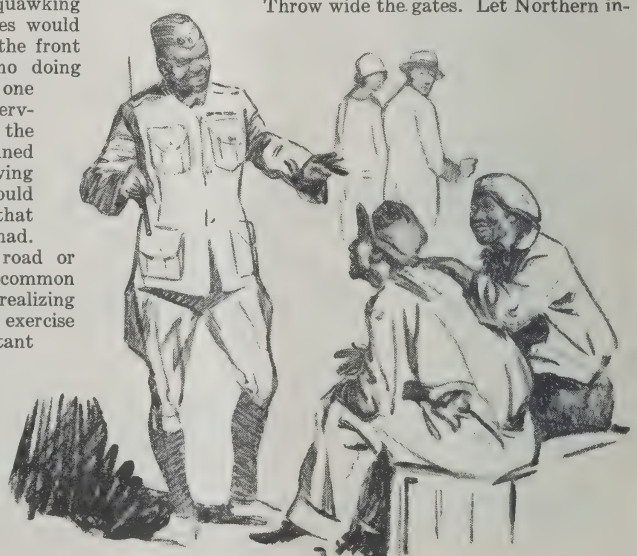
Instantly a December chill swept over the June sky of race relations. Away went war-time resolutions. That fine flower of brotherly love and mutual helpfulness, that came forth after Reconstruction and grew for forty years until it seemed about to burst into blossom with war service, suddenly shriveled and perished. If race mixing was what the negro soldier was going to ask for his war service, it ended everything

Racial integrity is the very citadel of a race's power, the safeguard of those finest qualities which give each race its value to civilization. The instinct to preserve its integrity is merely the race's instinct for self-preservation; before it duty to fellowmen, civic ideals, religion, everything, must bow finally. Were it in the white race to compromise with this profound biological law it would be the proof that we are already a disintegrating and a doomed race.

The black man got other things in France than a taste for hitherto forbidden associations; he got worldly experience and courage and self-respect and an entirely new estimate of his importance in the general scheme of things. He had become acquainted with new peoples and he had also seen the tremendous power of men who pooled their strength in organizations. Not supinely would he slip back into the old ruts; he would fight to hold the step gained. Crumbs could not satisfy him now. He would go North where there were no discrimination laws and where they said a negro fared better.

And he did go, some ten or eleven hundred thousand of him.

Nor did those of the race who remained in the South drop back into the old pre-war meekness and standards of living. The spirit of the soldier had infected the entire race. Organizations created and directed by negroes—*at least they seemed to have been created and directed by them*—for the first time made themselves felt in the business and sociological affairs of the South.

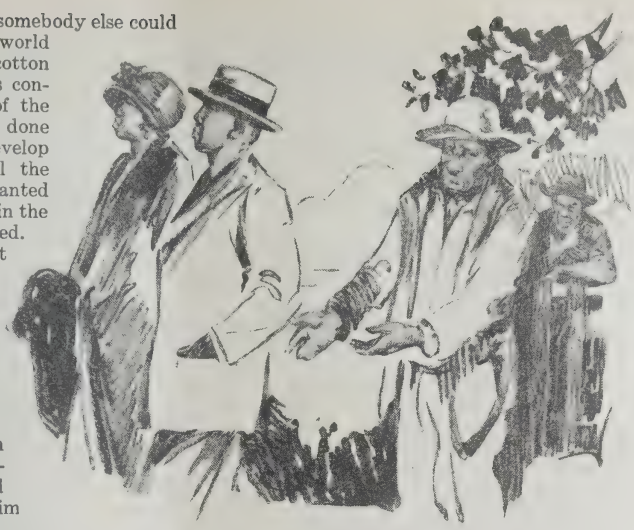


Other organizations, looking to political and social advancement, sometimes led things to strained situations and in a few instances to rioting. Never in all our experience, not even during the Reconstruction, were negroes harder to "keep in their places" or less observant of the requirements of common courtesy. A knock at the front door would as likely as not prove to be a washerwoman or a farm woman with a squawking hen for sale. Groceries would be slammed down in the front hall and there was no doing anything about it—if one got one's groceries. Servants found eating at the dining table merely grinned if discharged, knowing that their successor would do the same thing and that another job could be had.

Crowding off the road or sidewalk became so common that the white people, realizing that somebody had to exercise restraint or have constant friction, took it in silence. Tenants told their landlords what sort of supplies they wanted and what sort they would not have. No matter how well paid, work was performed in the spirit of bestowing a begrudged favor. Little things these, but the sum of little things makes a big thing; this daily and universal friction had the appearance of a preconcerted movement to storm the color line, at least of a universal resentment of it and made the white race realize that a new phase of its eternal race problem had appeared.

But as the negroes continued leaving for the North the white people began to worry about other things than the negro's restiveness. Financial pressure can make a dent on even Southern pride; an insolent, arbitrary negro was better than none at all. War debts, increasing taxation, high cost of living, coupled with a diminishing production on farm and in industry, filled us with alarm lest we become bankrupt. Again and again we increased the negro's wages until there was nothing left, but we felt that we must hold on somehow and perhaps a change would come. But the negro was not satisfied and began demanding better homes, better schools and shorter hours; he got these, too, many planters throwing in such extras as barbecues and picture shows and Saturday night truck rides to the towns. Yet even when he had done these things the planter had no assurance that some fine day he would not find his tenants had boarded a North-bound train, leaving the growing crop or ripening harvest and unpaid debts for the year's supplies.

The negro gave the screw a twist too many for the head came off. Even could we have afforded this extortion—and we could not, for the negro was already getting all the money we made—it would have done no good; the very quality of the demand proved that the granting of it would not have sufficed. It was not better homes, better schools, better wages, that the negro wanted; we knew and he admitted that the difference in living conditions made his Southern income equal to his income in the North. It was something else that he wanted but that he knew he could not get here. Those who stayed made unprecedented demands on us. But we were through.



Throw wide the gates. Let Northern in-

When the boys in khaki came home, quite different was the negro. In place of the shuffle-footed loafer was a springy-stepped man.

dustry have our labor—somebody else could worry about where the world would get its cheap cotton shirt. Let the railroads connive at the depletion of the South—as they had done after the Civil War to develop the West—and run all the "negro specials" they wanted to. And let every negro in the South leave, if so inclined. We had made the last concession that we intended to make.

Twice in his history as a free man had the negro flatly turned his back upon our financial interest and left us facing ruin; twice had he shown that he wanted something of us that we should rather die than let him have.

The negroes make no attempt to conceal their resentment at the return of their brethren who failed to make good in the North or those who winter in the South, leaving when work time comes.

As the white people looked over their deserted fields, considered their crippled business, their mortgaged homes with now no apparent chance of redemption, something died in their hearts. This was that paternal affection and feeling of responsibility the white Southerner has held for the negro ever since he has been on this continent. Born of slavery, it lived through the bitterness of Abolition, the bloodshed of the Civil War, the vexation of Reconstruction and the long years of poverty and humiliation the South endured while crawling back to a standing position in the nation. Perhaps in all history there can be found no other people who possessed such a unique place in the heart of another race. It was the one tried and dependable thing the negro possessed in this impulsive and swiftly changing America

Taking into consideration that the white people are not a wealthy people, the negro has fared as well or better than most of the peasant classes throughout the world. So well did he know that as long as the white man had bread he also had bread that the thought becomes the race's philosophy, "I'se gwine ter live anyhow till I dies." But the best of heart impulses will die, if too frequently hurt.

Some day, perhaps, when the negro has had more experience with that remorseless thing in human affairs generally termed the "survival of the fittest," he will not feel so scornful of the sheltered niche he had occupied in the Southern heart and of the place in its economic life which he had held to the exclusion of all other laboring classes. This battling with other peoples and new environments, to win or lose on merit alone, may develop great strength and be the making of the race; on the other hand cutting loose from the secure and age-old anchorage in the South may result in a helpless drifting about the country, taking whatever harbor or employment offers, a course that for any people can mean only the slow march to oblivion. It all depends on the negro himself, of whatever metal he proves to be made.

Around the year 1923 began the final change that was to mark definitely a new order in race relations. Having been forced against our will to make the effort, to our surprise we found that we could get along very well without those negroes who had left us. More, we who had imprisoned labor agents, sent protests to railroads and supplications to negro organizations, began to feel relief! While it had long been an accepted theory, we discovered the actual fact that our vast population of backward colored people was a dragging force. They could not rise of themselves; we could not climb very high with them clinging to us. With lessened numbers we could do better by them, they could do more for themselves; a better working, a more intelligent negro is a more satisfactory negro for the white man—makes more for the white man, makes more for himself—so the situation improved in both directions.

The exodus was proving a blessing in disguise. The negroes, too, feel that it was a good riddance of excess population. They make no attempt to conceal their resentment at the return of their brethren who failed to make good in the North or the appearance of those seasonal migrants who winter in the South, leaving when work time comes.

We sincerely want to help the negro race in its efforts to climb upward; we want to help the negro to appreciate and develop his own fine qualities, rich and valuable gifts, and bring them to the altar of our civilization. For all of his mistakes, for all of his waywardness, the negro is still the child of the South; nine-tenths of the race still live here. We feel that on us more than any other people rests the duty of helping him.

The race problem is too big in scope, too deeply rooted in race thought and feeling, too far-reaching in its significance to the future of America, for any rash experimentation by radical groups or offhand solutions by convention-hall resolutions. It must be worked slowly, cautiously, carefully from the ground upward. Any other method is juggling with unknown forces.

*This is the third and concluding article of a series by Townsend Boyer for this magazine.*

THE Abbey Theater, of Dublin, and its Irish Players are well known all over the world.

THE DEARBORN INDEPENDENT

in next week's issue will review this unique theater and *Sean O'Casey*, whose Abbey Plays have made him a sensation among playwrights.

# Why I Left New York

(*Continued from page 6*)

ably did not know it at the time, this training was fundamentally Anglo-Saxon. It was the code of our fathers, the fundamental code of America!

New York is different. *With its preponderance of aliens, with its conflicts in ethical and moral codes, its various and oft-times unbelievable interpretation of common politeness and business honesty, it seems altogether natural that the Middle Westerner should not feel at home.* Such as do are extremely fortunate in their associations or forget easily.

It has been frequently observed that the New Yorker in the Middle West makes a splendid guest. As a host I have heard him spoken of not so highly. Only recently, in a puzzled way, a Middle Westerner returning from New York, said to me:

"I couldn't understand Charlie. He used to be the life of the party when he visited here. I called him up the second day I was in New York. He said he was tied up but would see me on the day following. At the time I didn't think much about it. But since I've thought how different it would have been if Charlie were staying here. No matter how busy I might be I'd make it a point to drop by his hotel and shake hands on the way home.

"The next evening Charlie had dinner with me at my hotel in Times Square. While seated in the lobby waiting for him I thought what an utter unknown I was to everyone. It was easy to see how one could get terribly homesick there. Hundreds of faces and all strange. It would be different with Charlie I supposed. As a New Yorker in Times Square doubtless he would have many friends.

"Charlie arrived on time. He was a bit thinner and grayer than when I saw him last but he had lost none of his knack for clever observation. The dinner was better than the service and the show was almost worth the physical and nervous strain—because of the huge jam in Times Square—of getting to and from it. At midnight, after a pleasant chat, I walked to a subway kiosk with Charlie and he went home.

"While going back to the hotel the thought struck me that I had been no more a stranger during the evening than Charlie. He apparently had not seen anyone he knew. I recalled that on one of his trips west he had spoken affectionately of Times Square. There had been something almost proprietary in his manner. Yet during the course of six hours we were equally strangers to Times Square at large. Such a thing would have been next to impossible here.

"I didn't see Charlie again. I called his office and he was out. Later, in my box, I found a telephone message saying he would try to see me off at the train. But he didn't. Now if I didn't know Charlie so well I might say he was merely giving me the air. As it is I simply say I couldn't understand Charlie."

Not knowing Charlie, nor his circumstances, I couldn't enlighten my friend. But secretly I thought I recognized Charlie's tactics.

The fact is that the average wage-earning New Yorker is in no position to play host to the visitor to New York. It is a matter of economics plus very often a measure of false pride.

The average Middle Westerner makes the typical mistake of thinking that the

Middle Westerner who takes a job in New York immediately becomes a member of some vast and indefinable circle of Greater New Yorkers who dine regularly at the more celebrated cafés and hotels, see the best shows nightly, live in smart apartments, and rub elbows familiarly with the great and near-great.

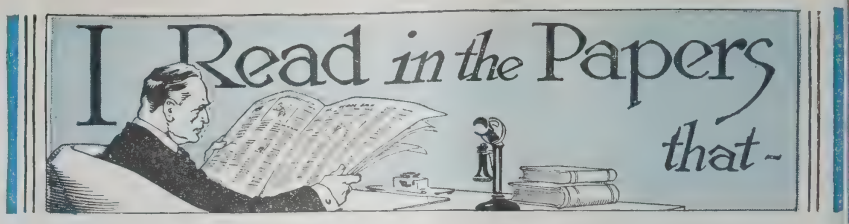
I was one of those who pictured it that way. It was after I lived there that I discovered that to take a young woman to dinner on Saturday night, then to a popular musical show and afterward a night club, with a corsage, cabs and tips, could easily nick me for two-thirds of a week's salary. Obviously seven of such large evenings would cost me fourteen-thirds of my hebdomadal stipend or say, roughly, about five months' work for one exhilarating week.

I feel that I can speak with some authority for the average New York wage-earner because for a long time I was one of him. If some of my Middle Western friends had let me know they were in town during my first few months in Manhattan I shouldn't have fallen on their necks unless it was to weep. In the Middle Western city from which I had come, I had lived at the athletic club. It was an ultra-modern edifice that boasted most comforts known to the *genus homo*. Waking at seven I used to slip on a bath-robe, go down a warm corridor, thence in the elevator to the plunge, where after a stimulating swim and shower I partook enthusiastically of a club breakfast. It was a club breakfast such as one got for forty cents in the Middle West in the Rooseveltian era.

If some of my brother club members had seen me in my Washington Square quarters—sixteenths, relatively speaking—arising from a creaking bed and dashing down a narrow draughty hallway to take a chills and fever shower they might have thought I was paying a bet but would never have believed it was on the level.

If, later, they had observed me at breakfast in a one-arm café where, after tipping the counter-man a nickle, I had with his approval walked away carrying eggs, toast and coffee, the quality of which left one somewhat in doubt, they could be forgiven for thinking something might have happened in the Middle West which made it impossible for me to go back.

Very human false pride, at least I think it is very human, would have kept me, especially during those first few months, from exposing my manner of living to my Middle Western friends. I know when I got the chance to go to New York they thought I had reached the penultimate rung on the ladder of human attainment. The shock would have been too great for both of us.



Singularly enough, first-rate New York entertainment—the kind we read about—is out of the reach of the average wage-earning New Yorker.

*This is the first of a series of two articles by Mr. Arms. The second will appear in next week's issue.*

## Saint Gregory and Usury

SAINT GREGORY, of Nyssa, wrote thus of interest on money:

"He who would give the name of robbery or parricide to the iniquitous invention of interest would not be very far from the truth. What, indeed, does it signify if you have made yourself masters of the wealth of another by scaling walls or killing passers-by, or if you have acquired what belongs to you by the merciless method of the loan?"

the wars of humans are considered beneficial to birds. During and following every great war an increase in the number of birds is noted, giving rise to the theory among ornithologists that birds multiply because men are too busy using guns upon each other to turn them on the denizens of the sky. When Goldwin Smith, the noted English professor, visited the United States after the Civil War he remarked upon the numerous coveys of ducks along the waterways. The World War again brought the phenomenon into prominence, poets and buck privates alike commenting upon the presence of birds on the battlefields. The subject now comes before the public through a meeting of ornithologists in Dublin to consider the establishment of bird sanctuaries throughout Ireland. It was stated as a fact that there are now more birds on the emerald isle than there were before the uprising of 1920. Removal of the usual checks always results in excessive reproduction throughout the animal world, scientists declare. It is a curious commentary upon Nature that the wholesale slaughter of human beings reacts as a blessing to other forms of life.

it appears to be a slack season for the propagandists. Witness this editorial lament from the columns of *The Courier*, of Gibson City, Illinois:

"The past two weeks have been rather quiet in propaganda circles, yet the editor's waste basket has managed to accumulate fifty-nine pieces of press matter, ranging in length from two or three sticks to two or three columns, some of them costing only a cent and a quarter to mail, others of the *de luxe* variety sailing in under a four-cent stamp. To the persons who sent them, each piece of mimeographed copy represents a burning issue, or a chance to get free advertising, or a veiled graft, or the hope of seeing their names in the papers, or any one of a multitude of reasons that prompt people to overburden their stenographers and mimeograph workers and buy paper and envelopes and postage stamps. And practically none of these fifty-nine pieces of mail was more than perfunctorily glanced at by the editor."

the war against Troy has now been historically explained. Troy, which seems to have been destroyed at least four times, according to the evidence revealed by excavations, was really a stone highwayman, taking heavy toll of all the Black Sea trade at the point where it had to be transshipped across the peninsula owing to currents and perpetual storms. Helen, then, was not a girl, but a golden income which had not to be worked for. Jade from China has been found in the second buried Troy, from which the extent of the Black Sea traffic may be deduced. The Greek expedition was a business adventure (like the Norman Conquest) led by merchant-princes, such as Menelaus, who sold wine to the soldiers, and always kept an eye on the obols, so to speak.

in the matter of holidays, as in certain other fundamental subjects, the Chinese exhibit a lack of our sense of proportion which is often very trying to Western minds.

Even for the very small minority—a million or thereabouts—who have embraced Christianity, the advent of Sunday is no excuse for taking a day off. Whether it be farming, shop keeping, handicraft or merely pulling a rikisha, the average Chinese really prefers to be on the job—assuming that, as is generally the case, he can forget his occupation whenever he wants a cup of tea, a chat with friends or a snooze in the sunshine. The absence of a weekly day of rest throughout China is as pronounced as the absence of time clocks to keep mechanical record of hours spent industriously.

styles in crooks are changing. It has been noted heretofore by criminologists that crime nowadays is committed largely by youths scarcely out of their teens. Now comes Chief City Magistrate William McAdoo, of New York, with the declaration: "When I was young you could spot a bad character once you looked at him. Today gunmen and murderers are suave, well-dressed young men who look like fashion plates. You cannot tell they are dyed-in-the-wool crooks with guns in their hip pockets and dope in their vest pockets." The magistrate might have added that this does not indicate that criminals are drawn from a better class; it merely shows that they are becoming more clever at disguising themselves behind a cloak of honesty—and therefore are all the more dangerous.

atheists are objecting to the employment of chaplains by the Government. They want to banish such functionaries from the Army and Navy, on the ground that religious jobs are unconstitutional in a country where church and state are supposed to be separate. This seems to make good people unnecessarily excited. It is a curious rather than a menacing spectacle. Why should people who profess no faith feel it necessary to band themselves together to propagate their negative? Zeal on behalf of a positive religion is comprehensible. Zeal on behalf of a negative contradicts itself. A person cannot be converted to nothing.

GOOD-humor is one of the preservatives of our peace and tranquillity . . . Its effect is so well aided by politeness, that this also becomes an acquisition of first-rate value. Politeness is artificial good-humor. It renders a substitute nearly equivalent to the real virtue. It is the practice of sacrificing to those whom we meet in society all the little conveniences and preferences which will gratify them, and deprive us of nothing worth a moment's consideration; it is the giving a pleasing turn to our expressions, which will conciliate others, and make them pleased with us as well as themselves. How cheap a price for the good will of another!

—*Thomas Jefferson*
(in *Memoirs, Correspondence and Miscellanies of 1830*).

The DEARBORN INDEPENDENT

# THE ESSENCE IN THIS ISSUE

The cover tells you that this is Memorial Day Number. Three wars are now within the span of living memory. The widows of the Republic are now found in three generations. Is Memorial Day to remember the dead or to *remind the living?* Only a relative few have dead to remember, but all the living need increasingly to be reminded:—There is not a privilege we have today that was not bought for us with blood.

---

Mr. Ford's Page this week discusses a subject which has wracked the world's mind these weeks. Three kinds of strikes, the strike for rights, the strike for selfish power, the strike for destruction. England tried subsidies and doles, but they would not do. The general strike will not do either. Winning or breaking a strike does not improve the social machinery. England must go to the point of the trouble before improvement comes.

---

This man deserted New York. He tasted life in its newspaper offices, apartments and streets. This alien Babylon, he decided, was no place to rear a child. The hordes of low-type foreigner outraged every unwritten code his mid-western life had planted in him. Perhaps there never was so frank a description of the disgust with New York that so many have felt. Whether you like it or not, read it as the accurate description of a common reaction. (p. 5)

---

Did you see that *Saturday Evening Post* number of *Judge?* Do you know where the punch lay in it? It was in the *idea*. The rest was easy, after they got the *idea*. That number is going to give *Judge* a five-year boost for the simple reason that never were the American people so thirsty for an *idea* as now. For twenty years we have been refining on old ideas. Anything—anywhere—that indicates that somebody's brain is climbing out of the rut, is to be welcomed with great shouting. *Have you got an idea?* Do you know how to get ideas? Prof. Donald Laird gives you an idea how to get ideas. But the truth is so simple, you may miss it. (p. 7)

---

A Knight of the Comb, King of the Barbers—why not? All excellence is great. Not that Sean cares. When one does the thing, it matters little what the others do. (p. 2)

---

We have always felt that Harry Barnet's forte was writing about the South and its people. He always gets his stride there. No one can write, or even read, about the South unless he has a feeling for the South, but some writers have the magic faculty of evoking the feeling in you. Here is a homely, simple quest of spoons and hollowed water troughs, spinning wheels and chimneys. The people of the Southern mountains are great handicraftsmen, as maybe you know. (p. 24)

---

I remember still the lovely blue earthenware and candlesticks they showed me down in the Carolinas, and the corn-husk "mats" that stood before the log house doors.

---

Let us hope that we are not M. M's. That stands for "messy motorists." It means people who litter up the green spaces of the country with grease-soiled newspapers and tin cans. No, of course, we are not that kind. But you'd be surprised how many there are and how boorish they are. (p. 14)

---

A man may become famous as a waiter. The best-known man in Detroit in my younger days was a peanut merchant who posted original signs in his window. People came for miles to read them. So here is J. Huggins, King of the Barbers, in the New York of the late 1700's. (p. 16)

---

In Nature it is the male that sports the finery—the little brown hen has a strutting, coxcombed mate. Once it was so among humans. Queensbury had his daily milk bath and the young bucks wore earrings. Read this masculine folly of style and weep at every sign of its return. (p. 12)

---

One fine thing about genius—it bloweth where it listeth; sometimes on a New England farm, sometimes in a shepherd's hut. This time it was a Dublin tenement, and it lighted on Sean O'Casey. Sean wrote first with pick and shovel on the streets of Dublin, and he still lives in one room, though his play, *Juno and the Paycock*, brought London to its feet in applause.

---

Curious things—names. Tennyson used to think and think on his, until he nearly lost consciousness. Some of us have names that don't do that—quite the reverse—they help to make us too self-conscious. One big fellow feels that his name, "Percy Cecil," belittles him. Fact is, he gives masculinity to it. It's been done. However, here's a little essay on names which every as yet unnamed infant should read. (p. 21)

---

Then there's some travel this week—down in Samoa. And a little serious material—how the court of international justice gives decisions. And—yes—two dances; one is the Waltz Quadrille as we do it at Dearborn; and the other—surely it is an odd coincidence—is the last article in the number, "The Sun Dance of the Blackfeet Indians," which doubtless is as much the thing in Alberta as the Waltz is at Dearborn.

---

And, of course, you will look over the Editorials, Chats With Office Callers, and I Read in the Papers. They are all alive with thought.

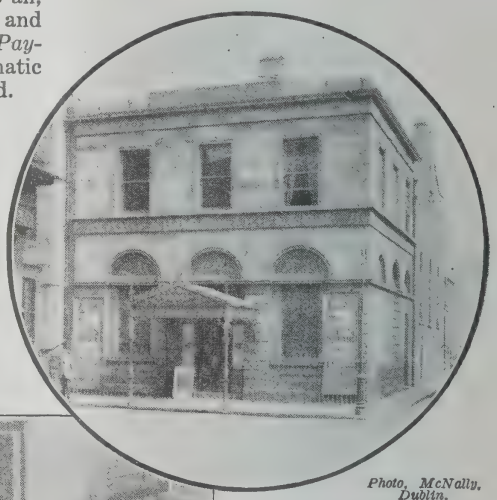
# The Abbey Theater Finds Sean O'Casey

## Dublin Workingman Attains Success as Playwright; Lives in a Slum Tenement

By V. S. PRITCHETT

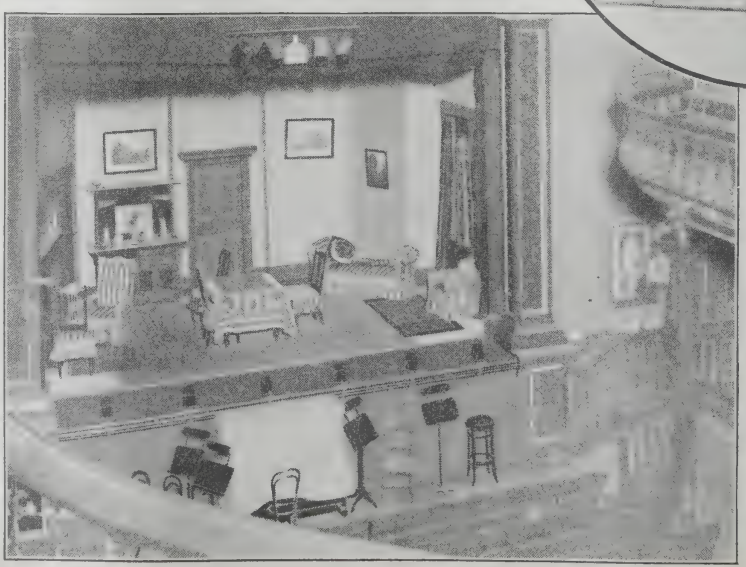
MANY of the best-laid schemes of mice and men have gone very much agley in Ireland; so that one looks with curiosity at those institutions which have survived. Says the song:



"Kathleen ni Houlihan, thy way's a thorny way,"

and he who in Ireland is commanded by some fine inspiration, and attempts to obey it, is faced by the leering odds of poverty, malice and impending failure at the outset. Many commercial, industrial and political ventures have either failed or have never been realized for one reason and another; but some have succeeded, and among these is the Abbey Theater which recently came of age.

William Butler Yeats, the distinguished Irish poet-dramatist, who won the Nobel prize for literature two years ago, was justified in believing the Irishman's traditional love of oratory would lead him to support an Irish national theater. The Abbey Theater and its Irish Players are known all over the world to those interested in literature and the drama. The Abbey must be one of the oldest repertory theaters in the world, for it was in the vanguard of that independent theater movement inspired, in part, by Ibsen's break with contemporary dramatic schools which began a generation ago. How many of those "independent theaters" still survive?



This does not mean that the Abbey is a cosmopolitan theater for "arty" drama. This was the tendency of the Irish Literary Theater out of which the Abbey grew. But the Abbey is a very distinctly Irish theater and its inspiration has been almost entirely from the hills and folklore of Ireland.

The object of the Abbey was (and still is), according to the manifesto issued by W. B. Yeats and Lady Gregory, to build up a Celtic Irish school of literature. This literature has been created for the Abbey and has been the backbone of the Irish literary revival. Lady Gregory, W. B. Yeats, Synge, Lennox Robinson, Padraic Colum and T. C. Murray are names known to all, student and occasional reader; and lately the author of *Juno and the Paycock*, described as the greatest dramatic find since Synge, has been added. The Abbey has kept a skillful middle course in the hazardous sea of Irish politics and has managed to keep fairly clear of the toes of the many jarring sects. The actors and actresses the Abbey has produced—Sara Allgood, Maire O'Neill, J. N. Kerrigan, Phillip Donovan and Arthur Sinclair, to name no others—have received wide recognition. The idea of creating an Irish literary theater was mooted somewhere about 1898. Edward Martyn and W. B. Yeats, carrying across St. George's Channel the standard of revolt against the commercialized theater, wanted to establish a literary theater in Dublin, then, as now, visited chiefly by inferior touring companies. The fruit of conversations with Lady Gregory was that in 1899 Yeats' *Countess Cathleen* and Edward Martyn's *Heather Field* were played in Dublin by English players. Immediately, this being Ireland, there was trouble. Some purist discovered a travesty on Irish character and religion in that part of Yeats' play where some peasants are represented as selling their souls for gold. Sides were taken and the controversy looked ugly. But the theater weathered the storm and a saving touch of humor came to relieve the tension for Yeats and his friends.

*Photo, McNally, Dublin.*

The Abbey Theater, Dublin, the backbone of the Irish drama for many generations. The latest O'Casey play was tendered an ovation which surpassed any that had ever taken place in the Abbey.

At one of the performances the second merchant, who was supposed to bring in a strangled hen and throw it on the ground, came in without the hen. Yeats, scenting another controversy,

(Continued on page 27)

# Here Is a Court Without a Sheriff

## Court of International Justice Gives Decisions, But No One Enforces Them

By CHARLES GILBERT REINHARDT

OVER in the charming, sleepy city of The Hague stands an imposing building, amid spacious, expensively maintained grounds. It was built with money given for the purpose by an American, Andrew Carnegie, who hoped there to stage the final enactment of the philanthropists' dream throughout the ages—World Peace. The building is known as the Palace of Justice.

Within the palace sit on occasion eleven men, learned in the law, who compose the Permanent Court of International Justice, better known in America as the World Court. Each of the judges is of a different nationality. Among them is an American, John Bassett Moore, former Assistant Secretary of State. To this group of eminent jurists the nations of the world are invited to submit for peaceful settlement differences which may arise among them.

*A Comparison Between Two Courts*

"But how," asks the average American, "does this World Court compare with the courts to which we turn for justice in our own personal and business affairs? Do sovereign nations stand before its bar to be judged? May a plaintiff or defendant state be represented by counsel as I may be by an attorney? Does the court punish offending kingdoms or empires by assessing fines? Does it rule on questions of ownership? If so, how are its decisions enforced?"

There are students of international affairs who say that no comparison may be drawn between our own county or supreme courts and the Permanent Court of International Justice, to which only nations may appeal. And there are others who say that justice is justice whether sought by men arrayed collectively as nations or by men seeking only redress of individual wrongs, and that all courts dispensing justice are comparable. Certain outstanding differences exist, they admit, between the county court in midland America and the World Court in Europe, but an understanding of the one may lead to a knowledge of the other.

For purposes of comparison, suggest such students, let us say that Henry Johnson and Peter Wilkins are American farmers whose adjoining acres are separated by a fence. Wilkins determines to increase his holdings at Johnson's expense. Perhaps he believes sincerely that he is right, that an ancient title gives him some of the land on which his neighbor now raises paying crops. Wilkins, then, tears down the dividing fence and sets up a new one ten feet within the Johnson line. The property thus added to his own field he claims.

Johnson protests. Wilkins is obdurate. Johnson determines to put the fence back on its original line. Wilkins appears with a gun and threatens to shoot if the fence is moved. Johnson conceivably may do one of two things. He may bring out his own shotgun, or he may go to law. If he is wise he chooses the latter course. In other words he appeals to the court.

The lawyer who represents Johnson then starts suit. First he brings civil action for damages against Wilkins for trespass. Next he turns to the criminal side of the court and asks that Wilkins be put under bonds to keep the peace, for Wilkins has threatened physical injury to his neighbor.

The court orders Wilkins to appear and defend himself against the charges. A summons is served by the sheriff or his representative. If Wilkins fails to obey the summons, the case is decided against him by default. But we'll assume that he appears as defendant and loses his case. What happens then?

As the case has been decided in Johnson's favor by the court, he is awarded money damages against Wilkins for trespass. Furthermore, he can tear the fence down and move it back to its original location. The bond to keep the peace prohibits Wilkins from further opposing him. The sheriff will see that he obeys that prohibition or suffers the penalty.

In the matter of the trespass, the court has entered judgment for Johnson. Johnson can have this enforced by requesting the clerk of the court to issue an order to the sheriff to collect the judgment under a writ of execution. Under the authority of this writ the sheriff may then seize Wilkins' property and sell it to satisfy the judgment.

Thus in each step of the procedure, the orders, the decisions, the judgments of the court are enforceable by the sheriff, who represents the executive arm of government.

*When Appeals Are Made to World's Court*

Now, say the students of international affairs, let's assume an analogous situation wherein Johnson and Wilkins, instead of being American farmers, are sovereign nations. To preserve the parallel, call them the Johnsonian Republic and the Kingdom of Wilkensia.

The Kingdom of Wilkensia asserts the right to occupy a piece of territory that belongs to the Johnsonian Republic. The Johnsonian Republic then says officially to Wilkensia, "That territory is mine. Your further occupation will therefore be regarded as an unfriendly act." Wilkensia replies, "We are going to occupy it nevertheless," and prepares to enforce her will with warships and guns.

It was at this stage of the controversy that Johnson, the farmer, appealed to the court, and Wilkins, his opponent, was forced to accept the court's decision. Johnson, you recall, sought justice through the regular channels instead of bringing out his own shotgun.

The Republic of Johnsonia has somewhat the same choice as had Farmer Johnson. It can either declare war or take steps to bring the dispute before the World Court. But while Farmer Johnson, backed by the sheriff, could compel Farmer Wilkins to submit the decision to the court, the Republic of Johnsonia has no such power. It must first obtain Wilkensia's consent to have the World Court enter into the case at all.

If Wilkensia refuses to go to the World Court, the Johnsonian Republic is in a situation such as Farmer Johnson would have faced had there been no court or sheriff to protect him. It must fight for its rights.

*There Is No Sheriff to Enforce Decision*

If, however, Wilkensia agrees to go before the World Court, both nations must sign an agreement or treaty to that effect. In the written compact they must frame the issue and agree to abide by whatever decision is rendered.

The two states then appear before the court. Each is represented by counsel, as were the farmers in the county court. In this case the court would probably decide in favor of the Republic of Johnsonia. What then must Wilkensia do?

The Kingdom of Wilkensia can abide by the decision and withdraw its claims on the disputed territory. That is what the sheriff forced Farmer Wilkins to do, after he had paid damages for trespass. But suppose Wilkensia says, in effect, "It is true that the Permanent Court of International Justice decided against us. However, we regard the decision as so iniquitous that we are determined to consider our preliminary treaty as a mere scrap of paper and to retain the territory." What can Johnsonia do? Where can she turn for a sheriff to enforce the decision she has won?

That depends on the relationship of

the Republic of Johnsonia not only to the World Court but to the League of Nations. If the Republic adheres to the court under the conditions proposed for the United States in the Senate Resolution, she can do nothing except fight or submit. Of course, she can state her willingness to give way to Wilkensia in such a manner as to hold that nation up to the contempt of all civilized peoples, for public opinion is strong even among nations. But, insofar as the Republic of Johnsonia is concerned, there is no executive power comparable to a sheriff to enforce for her the rights which the World Court has decreed.

If, on the other hand, the Republic is a member of the League of Nations by virtue of having signed the Versailles Treaty, she can, if necessary, fall back on the famed Article X, which contains the guaranty by members of the League that territorial integrity will be protected. Under that article it might be possible to organize a combination of armed forces of the various members—which would constitute something comparable to a sheriff's posse—to insure recognition of the court's rulings.

It might be explained here that some of the nations which signed the original agreement setting up the World Court bound themselves to submit to the court any dispute arising among them which fell within the scope of the court's jurisdiction. Some of the more powerful nations are not included in this list, however, nor will the United States be so included under the conditions on which it proposes to join.

Thus has the entire parallel been summarized by a careful student of international affairs:

"In an American court it is not optional with you, if you are a party to a suit, whether you will submit your controversy to the jurisdiction of the court. If you are brought into court by proper process, there you are, even against your will. At The Hague both litigants have to agree to submit their dispute to the court to give it jurisdiction. In the American courts, in other words, jurisdiction exists by compulsion; at The Hague it exists by consent.

"In America, the decree of the court, if not voluntarily complied with, will be executed by the force at the disposal of the executive power of Government. If you are ordered to pay money and fail to pay it, your property will be condemned and sold and the proceeds applied to the payment of the judgment. If you are ordered to do something or to refrain from doing something and you disobey, you will be in contempt and may land in jail. At The Hague each litigant promises in advance to abide by the judgment when rendered; but if this promise is broken nothing will happen unless other nations perhaps use their combined force to coerce or crush the offender."

The duty of the World Court, however, is by no means limited to decisions on cases submitted by disputing states. The League of Nations may from time to time call upon the court for advice. If the court complies, it is said to give an advisory opinion. Much of the recent discussion over the World Court in the Senate centered around this jurisdiction of the court. Opponents held that the United States would not want to join or support the court if it were merely the legal department of the League of Nations, or if it should develop the habit of giving advisory opinions regardless of the desires of states directly interested in the dispute. In other words, it was feared that the court might, without the consent of the United States, give advisory opinions upon issues in which the United States was interested.

There are men who point out that international courts, not of law but of arbitration, have existed before. Such a court is the Hague Tribunal which, too, sits in the many-spired Palace of Justice, and which may take jurisdiction of any kind of dispute which the nations refer to it. It has been further pointed out that the Hague Tribunal was in existence when the World War broke out; that Serbia offered in 1914 to submit to it the controversy between her and Austria (the spark that started the world conflagration) and, finally, that when the German armies marched across the Belgian frontier, the trampling feet of its soldiers and the lumbering wheels of its gun-carriages passed within a few miles of the Palace of Justice, where the Hague Tribunal then sat and where the World Court sits today.

Largely through the efforts of Senator Pepper, of Pennsylvania, there was included in the Senate Resolution of adherence to the court the provision that no advisory opinion on issues to which the United States is a party be asked or given without the consent of the United States. It further provided that the United States decline to be bound or otherwise affected by any advisory opinion which it does not join in requesting upon issues to which it is not a party, but in whose decision it may have an interest.

The Permanent Court of International Justice held its first session four years ago, opening with appropriate ceremonies on January 30, 1922. Since then it has had before it nineteen cases, one of which was withdrawn, eighteen actually handled. In six of those eighteen cases, definite judgments were given under the ordinary procedure of the court. In eleven, advisory opinions were handed down. In one, the court refused to render an opinion.

What were those cases? What were the decisions handed down by the court? How did they affect World Peace? Two of the questions can be answered from the records of the court. The third probably will remain ever a mystery.

The first judgment of the World Court was made in what is known as the *Wimbledon* case. Six nations appeared as complainants against Germany, after that nation had refused to permit the *Wimbledon*, a British ship, under French charter, carrying munitions, to pass through the Kiel Canal. The court found that Germany had exceeded its rights, and awarded damages to the charterer.

The second judgment concerned a Greek subject who, in 1914, had obtained public utility concessions from the Sultan of Turkey. Later Great Britain, as Mandatory for Palestine, refused to recognize the concessions. Greece then sued Great Britain for damages. Great Britain denied that the court had jurisdiction in the case. In August, 1924, the court gave the decision that it had jurisdiction. This, of course, made necessary a second decision on the case itself. That decision, actually the fifth, was rendered in March of 1925, and dismissed the damage claim.

The third and fourth decisions concerned treaty cases between Greece and Bulgaria. The court first interpreted certain provisions of the treaties. Later Greece asked what it considered as further instructions and the court ruled that it could not pass on the matter because it arose out of a situation not included in the agreement between the parties.

Another case was brought by Germany, which entered suit to test the validity of Polish expatriation of Upper Silesian territory. The court decided, against Polish contention, that it had jurisdiction in the case, which is now pending for judgment.

The first advisory opinions concerned the International Labor Organization, which is, in effect, a branch of the League of Nations. The court was asked to decide whether a Dutch delegate had been properly appointed; and whether the power of the International Labor Organization extended to international regulation of the conditions of labor in agriculture and to the examination of proposals for the organization and development of methods of agricultural production.

The list further includes opinions in controversies over the nationality of certain persons born in Tunis and Morocco; the rights of German colonists in Poland and a boundary dispute between Jugo-Slavia and Albania; the rights of Greek residents of Constantinople to continue residence therein under the provisions of the Treaty of Lausanne; the right of Poland to collect and deliver mail from Dantzig.

Perhaps the (Concluded on page 29)

# Why I Left New York

## Middle Westerner Decides That Contentment Is to Be Found Where He Had Left It

By L. L. ARMS

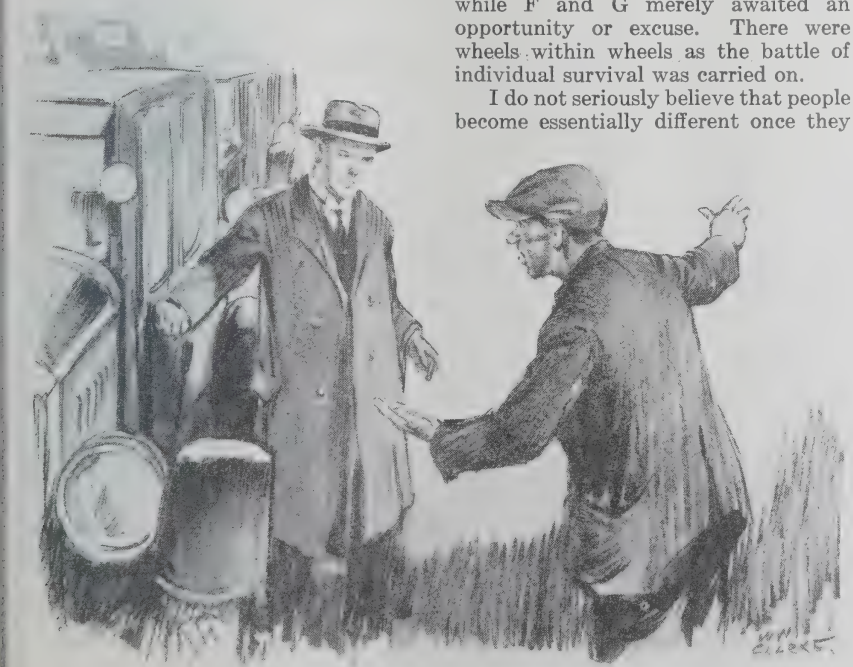
ILLUSTRATED BY W. W. CLARKE

I found about me foreigners or children of foreign-born parents in vast profusion.

*PART TWO*

THE New York newspaper office in which I first worked was interesting to me in many ways. In the matter of system and equipment it was an odd mixture of the very new and the screaming antique. It was an institution which the public knew was rich in both tradition and money.

Before arriving in New York I thought that such history and tradition would be sufficient to establish a splendid *esprit de corps* among the staff. Actually I found there was less of good fellowship and office loyalty than I had found in any of the places where I had worked on the Pacific Coast or in the Middle West.



It wasn't considered necessary that newcomers be introduced. Very few of the veterans went to the trouble of making themselves known to beginners. Thus, one found himself working daily among many absolute strangers. If by chance one got acquainted, very well. If not, it wasn't anything to worry about. This made for coldness and impersonality among the staff. Everything was based on individual survival. While it is true that one would not have to go to a New York office to discover cliques, I have never seen so many as flourished in the New York office in which I first worked. Stuffed clubs and verbal stilettos flew through the air. The entire office was a whispering gallery. If Clique A went about industriously to undermine a certain petty chief, Clique B quickly got wind of it and retaliated in kind. Meantime, Cliques C and D were conducting a guerrilla warfare spiritedly while F and G merely awaited an opportunity or excuse. There were wheels within wheels as the battle of individual survival was carried on.

I do not seriously believe that people become essentially different once they land in New York. The point is that the city is too big to permit the contact one finds everywhere in the United States except there.

It is this consummate impersonality, seeming sometimes to amount almost to downright unfriendliness, which makes it so tough for the new New Yorker. All of us have read of men, later famous, who said they were never so miserable as when they first arrived in New York.

Personally New York had me on the ropes in a week. I don't think anything except ridiculous pride kept me from beating it posthaste back to the Middle West. When I thought of the pleasant life I had led there, of my friendly associations, of the hundred and one magnetic things beckoning me, I wanted to sit down on my scarred iron bed in my two-by-four room and weep. But I stuck it out ten years.

I think that even in those early days I sensed accurately about New York that lack of the fundamentals which makes it an oppressively alien city to the true Middle Westerner. *In manners and customs the foreign influence is so dominant that it blots out almost everything else.* In the subways, in the parks, in elevators, at the seaside, I found about me foreigners or children of foreign-born parents with whom I knew I never could have anything in common.

An individual told me I could not park my car on a street open to parking unless I first gave him twenty-five cents.

Mostly they were Jews. In the Middle West I had never had any feeling about Jews. *But the Russian Jews of New York!* They were everywhere in a vast, endless profusion. It seemed to me the younger generation of them, almost blatant in their sense of equality, *were everywhere lowering the tone of common courtesy and outraging those unwritten codes which are deeply planted in every Middle Western schoolboy.* I cannot assert that my training was all right and theirs all wrong. That I cannot know. But I do know that in this upbringing there were such vast differences that I could never feel at ease where their practices influenced the tone of any given thing.

Since, as an average wage-earning New Yorker, I was forced to be much with them in the subway rush hours, in medium-price cafés downtown at lunch, at popular-price theaters uptown at night, in the office, at the beaches, in dance halls, at public libraries, indeed everywhere, except in my own lodgings or in the homes of my friends, and since my friends and I were outnumbered three to one, in later years it seemed easier on the whole for me to move than to expect them to.

It was this strident foreign overtone, which I sensed early in my New York experience, that made New York the only city I ever have been in for any length of time in which I could not feel at home.

There were times, especially when meeting out-of-town friends, when I was very proud to be a part of such a physically marvelous city. I always was aware of its cultural advantages. With a new hat and a stick I could swing down the Avenue with as much spring to my step as the next one. I have tasted the joys of suburban life and the real entertainment of commuting. I knew something of club life. Through the sporting writers, the columnists and the comic strip artists I was always abreast the latest in wisecracks. Yet during all the time I lived and worked in New York, I felt vaguely that I was missing something—those small and homely touches, not easy of definition, which are so much more a part of life in the Middle West than in New York.

In the Middle Western city in which I live I feel that I really know and have time to enjoy the persons with whom I come in contact and they know and have time to enjoy whatever is enjoyable in me. Out here the butcher, the baker and the ornamental candlestick-maker are my kind. That suits me.

It particularly suits me because it seemed to me in New York, when it came to the essentials of life, we were always dealing with some foreigner of quite recent vintage. Our grocer was a shrewd-eyed Italian, too obsequious of manner, too mellifluous of voice. At times, when surprised by some employe into a sudden aside, his manner and voice underwent a laughable change. Then he was fierce as a pirate and his stream of Italian was almost a bark. It was only too evident that Guiseppe's courtesy, like much that is to be had in New York, was on a hard dollars-and-cents basis.

When it came to owning and driving a car in New York I sometimes used to think that a man might as well be a clay pipe in a shooting gallery. Hat checkers and pasty-faced waiters, with built-in liquor trays in the pockets of their serving jackets, are frequently nominated as the world's greatest pests when discussing the tipping evil. I don't believe any of them can hold a candle to the entire army that is out to gyp the owner of a private motor car in New York.

I have been told in all seriousness by a middle-aged individual with a phony limp that I could not park my car around the corner from a cinema palace on Broadway, on a street which by city ordinance was open to parking, unless I first gave him twenty-five cents.

"This is my street," he announced. "I am watching all these cars."

Of course one might have called the police. One might have done this and done that. But, after awhile, I wouldn't—in New York. It's too much bother and, besides, if a man ever gets a moral victory complex in New York he might as well make a career of it.

Had I called a policeman, nothing would have happened. It seldom does. Had I gone into the theater and left my car there, paying no further attention to the self-confessed proprietor of this public thoroughfare, I might have found a flat tire, a paint job badly marred, a radiator cap missing or a stop-light bashed in when I returned. I have known it to happen. *Would it be apt to happen anywhere in America except in New York?* (Continued on page 18)

"Get that kid off'n that grass," said a park policeman with an angry note in his voice.

# They Find New Ideas and Use Them

## Great Discoveries Are Made by Men With Fresh Minds and Fresh Eyes. Who See and Know

Finding new ideas and figuring how to put them to use. New ideas by looking for them, by thinking, by observing.

By DONALD A. LAIRD

ILLUSTRATED BY J. C. GRAHAM

I HAVE found it most stimulating to become acquainted with what snobs call "the common people."

There is one thing I have noted: When I talk with a brakeman he tells me that there is something wrong with the railroads. Just what is wrong with them, he does not say; but he leaves no doubt as to there being something wrong.

Stonemasons tell me there is something wrong with the construction game. School-teachers feel much the same about their teaching, and farmers show me the accounts of their last season's crops, explaining how deductions got most of the profit. "There is something wrong with farming," is the only reason they can give; and when the average farmer's cash income in my county is a little more than three hundred dollars a year, I am inclined to think they may be right.

But *what* is wrong with all these? Is the world speeding along to ruin, or are they just chronic fault-finders and complainers? Or is there something wrong? Let's see.

A young man from South Africa sat beside me recently at a farm bureau dinner. His family had settled in South Africa from Holland three hundred years ago. They are now cultivating a farm of more than three thousand acres.

"Are you in America on a vacation?" I asked him.

"Vacation? I am working. I am getting new ideas here attending your agricultural schools and visiting with your farmers. I have learned a great deal which will go back to South Africa with me and be used. In each generation one of our family has made a long trip like this and taken back new ideas which we use, in—in competing with your farmers in the world markets.

"If possible I am coming back in ten years to find what advances your farmers have made," he further explained. "Just one trip by each generation is not nearly enough for us to keep up."

Finding new ideas, and hoping and figuring how to put them to use!

The brakeman wasn't. The stonemason wasn't. Are most of our farmers?

County agents tell me the hardest part of their job is not to keep up with the current improvements in machinery, seeds, and methods; it is to get the farmers to listen to their advice and to use the new ideas and improvements that are offered.

Age is probably one reason for this condition. It is rather difficult for a man with forty years of farming experience to believe that a newcomer less than forty years old can tell him anything new about farming. With knowledge of scientific farming, he can do so, however.

Great corporations have made interesting discoveries along this line. Every year representatives of their personnel departments scour the country for young men to take into the business, partly to learn the business, but more to bring in new ideas. They are after fresh minds and fresh eyes. Men who have been with them even five years are very apt to take everything for granted. They have become so accustomed to the business that it is difficult for them to note developments.

But they deliberately search for new men, unfamiliar with the business, to add to their force for the sake of unearthing new ideas that the firm and the workers may progress. They are no worshipers of traditions.

Within the past week I have received two letters from firms that are hunting young men. One was a well-known typewriter company, the other a leading manufacturer of clothing. Both concerns maintain a large planning department in which new methods are tried; new ideas developed and

# Samoa—America's South Sea Paradise

## Tutuila, Where Palm Trees Fringe the Shores and Pago Pago Affords an Ideal Haven

By WILLIAM LEE CALNON

COMPARATIVELY few Americans know much about Samoa and the interests of the United States in these islands in the very heart of the South Seas. Many are totally unaware that Uncle Sam is established here at all. Yet less than forty years ago, and again barely a quarter of a century ago, Samoa threatened to involve three great nations in war.

Today the United States has in Pago Pago the best and safest harbor in the South Seas; a naval station that is well equipped and manned by about 200 officers and men; an "unorganized territory" that is self-supporting; and a contented Samoan people who largely manage their own affairs. As time goes on the islands of American Samoa will become increasingly important, for the Pacific Ocean and its myriad isles are on the way to being a force in the world of commerce; and they will continue to be, whether or no the Pacific is "the battleground of the future."

Harbor of Pago Pago.

Honolulu, 2,300 miles to the north, is proud of its position "at the crossroads of the Pacific," but Pago Pago is another crossroads from the great continent of Australia and from New Zealand on the south; from Tahiti, the Society Islands and Cook Islands on the east and southeast; the Philippines and Asia on the west; the Panama Canal on the northeast; Honolulu, the United States and Canada on the north and east. Yokohama, in Japan, is nearly 100 miles nearer to Pago Pago than is San Francisco, the distances being given as 4,072 miles to Yokohama and 4,160 miles to the Golden Gate.

Pago Pago is served by a regular line of passenger and freight steamers, the Oceanic Steamship Company, of San Francisco, its ships plying between San Francisco, Honolulu, Pago Pago and Sydney, Australia. It is the port of call for many tramp steamers of all nationalities that find profitable the inter-island trade and the picking up of cargoes for Europe, Asia or America.

Pago Pago is on the island of Tutuila, the most important in the American group. The other islands under American control are Aunuu, Rose Island, an uninhabited atoll, and Tau, Olosinga and Ofu, the latter three known as the Manua group. Western Samoa, which is under British control and managed at present by New Zealand, consists of Upolu, on which Apia is located; Savaii, the largest island in the whole archipelago, and the very small islands of Apolima and Manono.

For sheer beauty the harbor of Pago Pago cannot be surpassed, yet its tropical location makes it a spot very infrequently visited by tourists, except those on ships bound north to San Francisco or south to Sydney. These get a chance to see the place for a few hours when the steamers stop there. From the sea the harbor is difficult to detect until the ship is directly in front of it. The outer bay is about a mile wide, narrowing as it goes inland for about half a mile. Then it takes a sharp turn and the inner harbor is reached. The latter also is about a mile long and half a mile wide. Once within it, the place resembles a mountain lake and is calm and placid.

The whole island is a volcano, long extinct, and the harbor is its dead crater, the broken-off section of which on the sea side makes the harbor opening. The mountain sides rise precipitously, varying from 1,000 to 2,141 feet. Covered with heavy tree growth and tropical jungle from bottom to top, they are majestic in the extreme. The trees include coconut palms, mangoes, papaya, breadfruit, bananas and many other varieties.

The only level land on Tutuila is along the sea and bay shores at the foot of the mountain range, except one fertile plain in the southwestern part. Palm trees fringe the shores, the buildings and native villages concealed behind them. The island is about eighteen miles long and six miles across at its widest point and contains 40.2 square miles of land. Nearly half the shore line is straight mountain side, with no beach. The other half has a road running around it and on this road are located the various villages. Copra, the coconut product, is the sole export of all the islands, and a heavy trade is carried on.

The oldest white institution in Samoa is the London Missionary Society, which first sent missionaries here in 1830. It is still in operation and conducts several churches and a school for girls at the far end of Tutuila. It found the Samoan a receptive person and has prospered greatly. The Samoan loves ceremony, and he loves to sing, so he goes to church Sundays and sometimes attends several churches. Otherwise religion seems to sit lightly with him.

From 1850 to 1870 more and more white traders and adventurers came to Samoa, principally English and German, though the (Continued on page 28)

# MR. FORD'S PAGE

STRIKES in the past have been of three sorts. Some have arisen out of working conditions which no human being should be called upon or expected to endure. No life is without hardship, but no wise order of life can be built upon a system that deliberately includes hardship as a daily and hourly experience. When, therefore, the management of an industry became so incompetent as to seek its own existence solely through the hardship of the workers, the strike or revolt against unnecessary inhumanity was bound to arise. Men would have been less than men had they not lifted their voices in protest, and, as a solemn memorial to the world, taken that step which, after all, worked its heaviest penalty on themselves, the deprivation which followed stoppage of work.

This sort of strike was adjudged by ordinary public opinion to be justified and insofar as it was justified it exerted great moral power, until now its causes and occasions are very few and far between. The employer whose methods are so faulty and whose vision is so narrow as to invite such a strike nowadays is thereby adjudged unworthy of the pretence he makes as an industrial leader. He has failed at some vital point in the work he is supposed to be doing for the general social benefit.

With the rise of these difficulties amongst the people whose livelihood was bound up in their wage-earning capacity, there quickly came an exploiting type of labor leadership which was as bad for the workers as any form of bad industrial management could be. There arose men of crude power who saw their opportunity to make a profession out of class antagonism. The strike became a favorite method of building up their power. Their business was to foment strikes for their own selfish purposes, as kings once fomented foreign wars to withdraw their people's attention from domestic distress. The strike as a prank, as a class attack, as the expression of hatred against all constructive industry, has had its day in this country, though in some places it still remains as the relic of a cruder time.

Then came the most sinister phase of the strike as a part of the strategy of competition. One manufacturer would pay strike leaders to start strikes in a competitor's shops, so that while he was wrestling with all the cost and loss and stoppage, the other man might reap the fruits of the market. Buildings were delayed and their cost increased beyond all possibility of repayment by this method. The strike leaders were guerrilla warriors with their private armies, willing to work for the highest bidder. This is a phase of the strike which seldom came to the attention of the people because its true nature was so skillfully veiled, but it was once a possibility to reckon with in this country—and in some industries it has not yet become an extinct possibility.

Generally, however, a strike means that something is wrongly based. Lack of leadership in management leaves openings for incompetent leadership to invade it from the outside. It is simply the working of the law that sufficient leadership leaves no gap for usurpers to enter.

*THERE have been righteous strikes. Strikes have also occurred for the purpose of maiming a competitor. And to establish selfish labor leaders in power. The old causes for strikes have all but disappeared. Management is removing injustices, and workmen have abandoned false leadership which made a profession of their troubles. Everybody sees that wrong can be righted, but not by winning or breaking a strike. England has tried the dole, the subsidy, and now the strike. It will not do. Nothing will do but building industry on the basis of service. Trade built on underpaid labor is not worth a farthing.*

In this country the workingman himself has learned to discriminate between his real and pretended friends. He has seen steadily arise all over the world, and quite clearly in the United States, a movement whose real objective is not the settling of trouble but the constant inciting of it. A social theory now preached in all our large industrial centers holds that satisfactory relations between management and labor are not to be permitted on any terms, but that class war is to continue until all productive industry is overthrown. That such insanity should exist with such coherency would be inconceivable did not the fact exist on every hand. Needless to say, the American workman is not taken in by it for a moment.

Great Britain's experience with the strike leaves no possibility of a doubt that somewhere in her industrial relations there is a fallacy. Trade is not worth a farthing that must be held at the cost of underpaid labor. Recognizing, as all must, the immense service which the British manufacturer and workingman have rendered the whole world in the past, the latter enduring their sacrifice through their strong sense of the world importance of their labor, it has long been manifest that a new basis must be found. No better workman exists than the man of the British Isles, and it is time that he came into the reward of his labors. But strikes cannot accomplish this. Doles cannot accomplish it. Subsidies cannot. Management must face the task of organizing industry so that it will supply the worker with his rights. Wrong theories have gained a strong hold on both sides of the British controversy, but the rightly distributed fruits of good management will wither false theories in a day.

## *The Day of Remembrance*

MEMORIAL DAY is the Nation's Sabbath, though often soiled with sacrilegious forgetfulness and sport. The nation that forgets its debt to its builders and saviors is flirting with consequences more to be feared than those which arise from a forgetting of monetary debts to creditor nations.

The purpose of this day is not merely to remember the dead, but to remind the living. There are now three wars within the memory of most living Americans. They were wars with great human causes as a background. The consequences of the earliest war which most of us can remember was the dissolution of slavery as an institution of this land. The second was for the removal of the last vestige of European tyranny from the western hemisphere. The third was to succor Anglo-Saxon civilization from grave peril.

The uninformed critic of America who accuses us of narrow and provincial interests might look upon the record of these wars; it clearly testifies the expansion of American interest and sacrifice—from a racial group to a hemisphere; from a hemisphere to the world. And this without stipulated gain, without the embroilment which selfish enterprises always involve.

We are to remember on this Memorial Day the great occasions when our nation lifted her hand in behalf of assaulted right. We are to remember the men of our nation who in the Civil War and the Spanish-American War, and the World War represented the might and the purpose of our people. In all the cemeteries of the land the survivors of these groups will pass from grave to grave with the simple honors for the dead. They remember.

*But the rest of us should be reminded.* Too many influences among us exert their power to make us forget, to cut us off from our roots, to make us deny and betray our kinship with the men who have given their strength to the expanding destiny of America—too many enemies among us would lay a sneer on the graves of the fools whose folly it was to die for their kind.

Therefore, *let us be reminded,* not merely to remember the dead, but that we are debtors, that there is nothing we have of basic social blessing that was not bought for us, freely passed on to us, at the cost of other men's sacrifice. This is the purpose of Memorial Day. The dead are forever secure in their glory; "It is for us the living," said Lincoln; it is for us the living to be reminded of our spiritual kinship with them.

## *Over for Now*

WITH a not unexpected suddenness the general strike in Great Britain was called off by the union leaders who ordered it. The outbreak revealed several facts: that the government of Britain is strong enough to do its duty; that the people of Britain are strong enough to control their own country; and that the workers of Britain were strong enough to resist the influence of Moscow. Moscow is the force really vanquished so far as its influence among Anglo-Saxons is concerned. An incidental benefit was that the great unemployed multitude of Britain immediately went to work, many of whom no doubt will remain at work permanently.

The strike was not a success. It ran "big" in American newspapers, but in essence it was a rather uncertain gesture. Great care was obviously taken to prevent any indications of victory for either side; as Premier Baldwin truly said, the victory was on the side of British common sense. There is more truth than rhetoric in that statement.

At the same time, as THE DEARBORN INDEPENDENT has never ceased to contend, the causes of industrial unrest in Britain exist and must be removed by the managerial brains of British industry. The only way to "beat" a situation like that which exists is to beat it by a method which abolishes the causes.

If Premier Baldwin can only succeed in getting his doctrine of common sense adopted industrially, this may mark the period of Britain's progress toward better conditions for her working people.

## *Daugherty Again*

THE heartening thing about the indictment of Harry M. Daugherty is that it was brought about by the very department over which he once held sway. It furnishes fresh evidence that corruption has no permanent place in America, that the Government is basically sound. While he was in office Daugherty considered himself a Warwick, a kingmaker. He was high priest of the spoils system. Wherever he could arrange it—and his power was great in the early days of the Harding Administration—he installed his own hench-

men and satellites in strategic posts in the Department of Justice.

He was eventually forced from the Cabinet by President Coolidge, but not before he had covered up most of his questionable acts.

For two years the country as a whole had forgotten Daugherty: but not so his former colleagues. Bit by bit they uncovered his tracks. And finally sufficient evidence was amassed to lay before a Federal grand jury. The indictment resulted. The taint cast over the Department of Justice has been removed.

## *Reconstruction in France*

WHEN Woodrow Wilson went to the Peace Conference in Paris he was urged to visit the "devastated areas." He was reluctant to do so lest he enter the conference with a prejudiced mind. Today he would have difficulty finding the devastated areas, were he ever so eager to do so.

Towns and villages have risen from rubbish heaps, and farmhouses, in all their pristine substantiality and picturesqueness, dominate the rehabilitated soil.

It seems strange that in this Europe of unrest, of potential warfare from day to day, the idea of permanency in building should remain through the centuries unimpaired. In France, as in Great Britain and other western European countries, they build for all time. Humble houses last for generations, as if they were baronial castles.

In five years more the battlefields themselves will be covered with trees and flowers and cultivated crops. So kindly does nature deal with the scars inflicted by man.

## *Still Learning Nothing*

WITH a stubbornness which events will surely break, or which will send England far down the list of industrial countries, the main solution offered for the British labor situation still remains a reduction of wages. That is the commonest refuge of managerial insufficiency. It is an irrefutable sign of ancient and outworn economy. When "finance" is reduced to the sordid necessity of "financing" itself out of workingmen's pay envelopes, it has reached its lowest level.

It would be ungracious at this time to assume a wisdom superior to that of British industrial leaders, and extremely shortsighted to overlook elements in the situation which are not in the keeping of any group. England was England before the industrial era, and England will be England when that era has passed her by. England did little for industry and industry has done little for her. Her greatness lies in other fields; her industry was a means to other ends than are usually recognized. Had industry been her great interest, she would have developed it along the lines of scientific mechanical improvement and sound human relations. While not so backward in these as some parts of the Continent, she has been far too backward to be accorded further recognition as a leader. The dominance of the old idea has been so strong, the refusal of British industrial leaders to recognize their kinship with the British worker has been so tenacious, that even if an upward turn is now taken, recovery of what has already been lost will be impossible. This is not the loss of the British Empire; it is really the Empire's gain, for the industry of England, scattered by the war, was replanted in the Dominions everywhere; but it spells change for England as a country.

The British workman is competent; British quality is good; where, then, has been the difficulty? British observers in America are reporting back home that the American works no harder than the English, but the American has better tools with which to work and gets a more honest share of his earnings in wages. This simply means that mechanical progress and sound human relations in industry have enabled American industry to grow. While English workingmen were being fed on committee theories and socialism, and English churchmen and philosophers were talking about the right of the worker to have a measure of control over the industry that employed him, and interminable meetings were held, and British industry and public confidence were going to the devil, American industry was putting in better machinery and increasing wages, and with it all creating a new and sound level of general prosperity.

If British industry wants to see itself in its true colors, let it look at the British working classes, as in a mirror. The sight accuses them of high treason against their race.

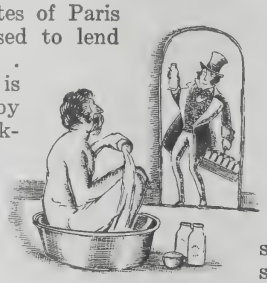
## *Twice in a Week*

TWICE in a week the North Pole has been shadowed by flying men, who did in a day what has previously required almost a year to do. Byrd flew to the Pole and back in an airplane; Amundsen did it in a dirigible. Thus is demonstrated beyond peradventure of a doubt that it can be done, and will be done often again until the route "over the top of the earth" is established. Thus a new era in transportation has been ushered in by engineering skill. The event is historic and truly wonderful, but we are too near to feel its wonder. That remains for posterity.

# Gadzooks! They Were Gallants Gay

## Beau Brummels Who Took Milk Baths, Wore Corsets and Carried Muffs

By ZETA ROTHSCHILD



ILLUSTRATED BY W. O. FITZGERALD

IN THE year 1802 Sheraton shaped and designed a chair which he called "a conversation chair for masculine use to protect their coat skirts."

"This chair was very narrow, the coat wearer sat astride it, and leaned his arms upon the back, which was cushioned on the top like the side arms of the chair. Of course the coat-skirts stuck out or hung down unwrinkled and uncrushed, to the admiration of all beholders and the confident satisfaction of the coat wearer."—*Two Centuries of Costume*, Alice Morse Earle.

In 1863—"The exquisites of Paris use milk, which is supposed to lend whiteness to the skin . . . The expense of this luxury is considerably diminished by an arrangement with the milkman, who repurchases the liquid after use."

"The late Duke of Queensbury had his milk bath every day. It is supposed to nourish as well as whiten and soften the skin."—*Habits of Good Society.*

"At the court of Louis XVI (1754-1793) dressing was the serious business

of the day . . . When his (D'Artois, who became Charles X) breeches were to be put on—he wore them very tight—this was the process: Four valets took their places in due order; two held the breeches open at a proper height; the other two, always tall and powerful men, raised the Prince from the floor and lowered him gradually into the garment, until it fitted like a second skin."—*Dress*, by Isaac Walker.

At the 1789 period—"There is not a man in the nation, no, not even Lord

Effingham, who bestows so much time and attention in rendering the external appearance of his head, elegant in the extreme, than the Earl of Scarborough. It is said that his Lordship keeps six French friseurs, who have nothing else to do than dress his hair. Lord Effingham keeps only five."—Ashton, *Old Times.*

"He—a dandy of the 18th century—would possess at least six coats of coloured velvets and white satin, trimmed with gold and silver lace, with perhaps one made in a plain fashion for use on mournful occasions. With these he would have the choice of perhaps a dozen long waistcoats, made in blue satin, gold brocade, green silk, white satin, scarlet, black silk with fringes, all laced and embroidered in coloured silks. His wardrobe also contained nine or ten pairs of breeches of velvet, satin, and cloth; half a dozen three-cornered hats, silver lace scalloped, laced with gold point d'Espagne, some with gold binding, and some bound plain; three dozen ruffled shirts and three dozen lace neck-cloths, and a like number of white silk, black silk, and fine cotton stockings; cambric and silk handkerchiefs galore; shoes adorned with gold and silver buckles set with diamonds; silver handled swords, silver mounted pistols; and as varied a choice in jewellery as his means would allow."—*The Eternal Masquerade.*

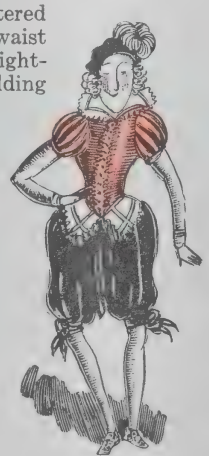
"This morning came home my fine camlet cloak, with gold buttons, and a silk suit, which cost me much money, and I pray God to make me able to pay for it.

"To my great sorrow find myself £43 worse than I was the last month, which was then £760, and now is but £717. But it hath chiefly arisen from my layings out in clothes for myself and my wife; namely—for her about £12 and for myself about £55 or thereabouts; having made myself a velvet cloak, two new cloth skirts, black, plain, both; a new shag gown, trimmed with gold buttons and twist, with a new hat and silk tops for my legs, and many other things, being resolved henceforward to go like myself. And

also two periwigs, one whereof cost me £3, the other 40s. I have worn neither yet, but will begin next week, God willing."—*Diary of Samuel Pepys.*

"One of the latest roads to fame that any of our young men of TON have discovered is to wrap their bodies carefully in flannel under the shirt, and to keep the coat and waistcoat quite open, to show the strength of their constitution, and set the snow at defiance."—Originally in London *Times*, January 2, 1797, but quoted in Ashton's *Old Times.*

"Among the eccentricities of Costume, was a Coat devised by the then Earl Spencer. He made a bet that he would cut off the tails of the coat which he then wore, and appear in public in a jacket, which, within a week, should be the fashion. He did so, and won his bet. Gillray caricatured the Earl, in a picture 17th May, 1792. Earl Spencer wears (in this picture) a blue spencer, red coat with brass buttons, yellow trouses, and blue and white stockings."—*Old Times*, Ashton.



Extract from letter (written to the *Englishwoman's Magazine* of November, 1867, reprinted in *The Corset and the Crinoline*) by W. B. L.:

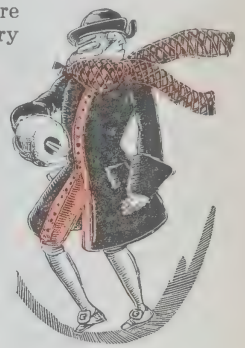
"From personal experience, I beg to express a decided and unqualified approval of corsets. I was early sent to school in Austria, where lacing is not considered ridiculous in a gentleman as in England, and I objected in a thoroughly English way when the doctor's wife required me to be laced. I was not allowed any choice, however. A sturdy madchen was stoically deaf to my remonstrances, and speedily laced me up tightly in a fashionable Viennese corset . . . I felt ill at ease and awkward, and the daily lacing tighter and tighter produced inconvenience and absolute pain. In a few months, however, I was as anxious as any of my ten or twelve companions to have my corsets laced as tightly as a pair of strong arms could draw them. It is from no feeling of vanity that I have ever since continued to wear them, for, not caring to incur ridicule, I take good care that my dress shall not portray me, but I am practically convinced of the comfort and pleasantness of tight-lacing, and thoroughly agree with Staylace that the sensation of being tightly laced in an elegant, well-made, tightly-fitting pair of corsets is superb. There is no other word for it.—Signed—Walter."

In the time of Henry III of France—

"Eardrops in his ears, delicate kid gloves on his hands; hair dyed to the fashionable tint, brushed back under a coquettish little velvet cap, in which waved a white ostrich's feather; hips bolstered and padded out, waist placed in the very tightest and most unyielding of corsets, and feet incased in embroidered satin shoes, Henry was a true son of his fashionable mother, only lacking her strong will and powerful understanding."—*The Corset and the Crinoline*, W. B. L.

"The high kick of fashion is to wear only one spur, like a postillion, and to have an assortment of long whips tied up behind the curricle, in case of wearing them all out in Bond St., during a ride in the morning."—Originally in London *Times*, August 3, 1796, but quoted in Ashton's *Old Times*.

"The items of a fashionable Taylor's bill are not a little curious at present. Ditto, to pasteboard for your back; ditto, to buckram for your cape; ditto, for wool for your shoulders, and cotton for your chest. Shakespeare talks of Nature's Journeymen who make men indifferently, but our Journeymen Taylors make their customers of any form and dimensions they think proper."—The London *Times*, September 6, 1799—*Old Times*, Ashton.



"The year 1850 witnessed the disappearance of the last eccentric dilettante Paris will ever see . . . Carnavale was no ordinary dilettante. He was a symbolist, and a harmonist as well. His garb varied according to the weather, the colour of his own thoughts, and the performances of the Italian Opera. When the *Barber of Seville* was to be played, he put on a canary-coloured coat; for the *Tancredi* he donned an apple-green jacket; for *Semiramide*, he wore a red frockcoat; and for *Lucia* he affected a sky-blue garment."—*Fashions in Paris*, Uzanne.

"A man's silk stockings could cost more than the coat on his back; a guinea for a coat perhaps, but the clocked silk hose embroidered on the instep cost two guineas."—*Two Centuries of Costume*, Alice Morse Earle.

"From the pages of *The Tatler* and *The Spectator* we learn of muffs and masculine muff-wearers, still assuming the muff as a distinct mark of dignity. It is told of a somewhat eccentric head of a college at Oxford University, at about this date, that, like a certain college president to-day, he had a vast aversion to the undergraduates wearing long hair. And he carried in his muff a pair of scissors with which he slyly clipped off offending locks."—*Two Centuries of Costume*, Alice Morse Earle.

"My mind very busy thinking of my great layings out lately and what they must still be for clothes; but I hope it is in order of my getting of something the more by it; for I perceive how I have hitherto suffered for lack of going as becomes my place. Or being resolved to go handsomer than I have hitherto. I hope I shall get better success than when for want of clothes I was forced to sneak like a beggar. Thus I end. For Clothes I perceive more and more every day is a great matter.'' —*Diary of Samuel Pepys*, December 28, 1664.

"In less than twenty years after Harvard College was founded these rules were prescribed.

" 'No Schollar shal goe out of his chamber without a Gown, Cloak, or Coat; and everyone everywhere shal were modest and sober Habits, without strange, ruffian-like- or new-fangled fashions, without all lavish Dress, or excess of Apparel whatsoever, nor shal wear any Gold or Silver or jewels without the just permission of the Precident, nor shal it be permitted to wear Long Haire, Locks, Foretops, Curlings, Crispings, Partings, or Powderings of ye Haire.' "—*Two Centuries of Costume*, Alice Morse Earle.

"In your apparel be modest, and endeavor to accommodate nature rather than procure admiration. Kepp to the fashion of your equals, such as are civil and orderly with respect to time and place.

"Play not the peacock, looking everywhere about you to see if you be well decked, if your shoes fit well, if your stockings sit neatly, and clothes handsomely."—*Rules of Courtesy and Decency of Behavior*—George Washington.

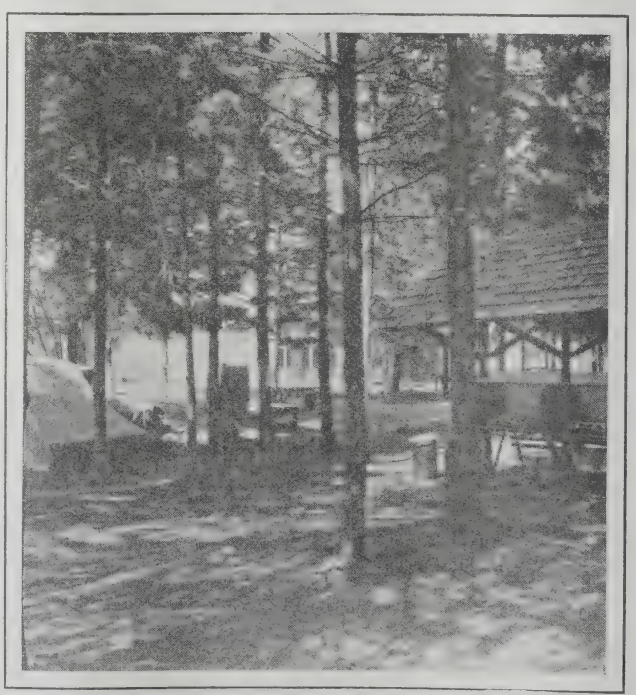
Tourist camp at St. Paul, Minnesota, on a high bluff facing the Mississippi River. This scene shows the popular use that is being made of such places.

# Messy Motorists Mar the Landscape

## Unmannerly Tourists Tear Down Trees and Outrage the Canons of Cleanliness

By GEORGE W. SUTTON, Jr.

OVER all the countryside these early summer days justly irate farmers are tacking signs to trees and fenceposts:



"No Camping Allowed."

Owners of waterfront property are employing special watchmen to keep unbidden visitors from their shores. Private owners of wooded land are forced to retain fire guards to patrol their land and stamp out camp fires left by the careless.

The summer camper and picnicker are for the most part unwelcome in the country. And it is all because there is in our population an element, not particularly large but extraordinarily objectionable, which does not know how to behave itself away from home, or doesn't want to—which amounts to the same thing. This element is made up chiefly of those of foreign birth or extraction, who have foreign precepts of behavior and cleanliness.

By far the larger proportion of our automobile tourists have decent rules of conduct and deportment; they respect the farmer's desire to keep his land clean, and they aid him in every way possible. But the many must suffer for the sins of the few.

Every Sunday, from every large, medium and small city in the land, there occurs a motor migration into the country. Lunches are spread out or prepared in the loveliest available spots. Health-giving country air is consumed in large quantities along with the dill pickles. The bright sunlight of the countryside, with its recently understood medicinal benefits, is enjoyed along with the warm bananas and discouraged cucumbers. And then, when the distant hills are purpling, the long and congested trek homeward begins.

(C) Ewing Galloway.

This up-to-date park in Portland, Maine, typifies what many cities are doing for the convenience of tourist campers.

And the beautiful, verdant, smiling countryside looks as if an army had tramped over it, discarding all its equipment on the way.

Paper bags, paper dishes, tin cans, broken bottles, banana skins, paper napkins, and cardboard lunch boxes are scattered everywhere. Fruit trees, vegetable gardens and flowering shrubs lie broken and despoiled.

The practice of leaving behind an unsightly and unsanitary mess is a sin of motor campers as well as picnickers. It is one of the main reasons why something like 5,000 of our towns and cities maintain municipal camps. And yet, the remedy is simple! It lies, of course, in the observance of the rule by all motor picnic addicts and all automobile camping tourists to "Clean Up After You."

Another rule which would remove most of the objections to motor campers and those who lunch along the highways is: "Respect the Rights of Others."

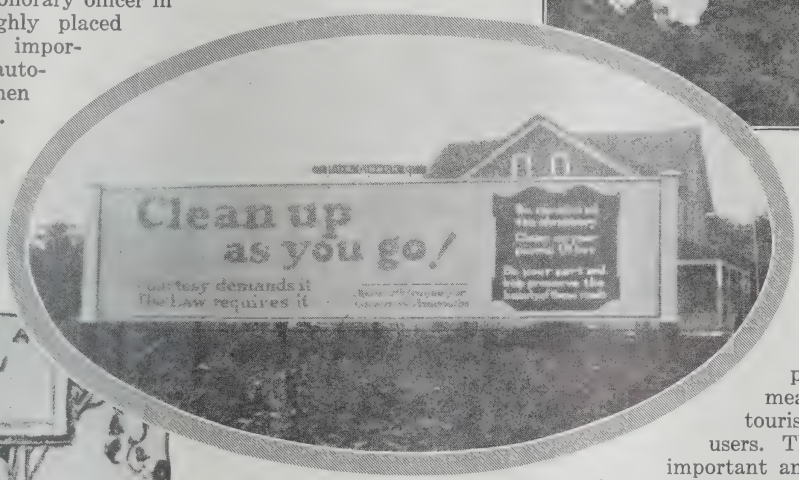
It is not always easy to distinguish between the particular errors committed by campers and those enacted by the picnicking myrmidons. They tear down fences and valuable trees for firewood, steal vegetables, flowers, fruit and sometimes chickens, eggs, and milk on the hoof, as it were; pollute wells, ponds, and springs by washing dishes and clothes in them; go swimming in scanty costumes in too close proxim-

ity to highways and habitations; violate game and fishing laws; and in other ways give evidence of their total irresponsibility and barbarity.

Mind you, it is the *few* who do these things and bring down upon the heads of *all* motor wanderers the just and restrictive wrath of public authorities and owners of wayside property.

If the great numbers of self-respecting, orderly, tolerant people who enjoy motor picnics or motor camping could force the others to mend their ways, there would be an enormous change in the public attitude toward motorists. But even the suggestion of such a task is enough to stagger the imagination.

A few years ago there was conceived in the mind of a magazine editor a plan to remedy this situation. He organized the Motorists' League for Countryside Preservation. President Harding became an honorary officer in it, as did other highly placed government officials, important members of the automobile industry and men of rank in civic affairs. Membership cost nothing, the only requirements being the signing of a pledge to avoid the commission of depredations and to use influence to compel others to preserve the beauty of the countryside. Members flocked in by the thousand and the movement gained increasing momentum. Then the magazine left its field and the editor passed on to other work. The association died of inanition because it required a great deal of time and clerical help and a considerable amount of money. But sufficient progress had been made to prove that real results could be obtained in this direction. The American Automobile Association, with headquarters in Washington and with more than 600,000 members, is now undertaking a similar work. It has made really important headway in some parts of the country, but the task is a gigantic one.



Of the vast army of Nature Destroyers, several divisions of shock troops have been assigned to do their bit in wreaking havoc along the navigable waterways. They might be called the Vandal Navy. In rented rowboats, in overcrowded motor craft and in pairs and quartets in canoes, they launch their attacks on private beaches, riverside pine groves, public bathing places, and green, sequestered coves. They take off their derby hats and all the rest of their clothes in full view, put on their bathing suits and then plunge into their serious work, whether it be the spreading of a litter of papers, broken glass and sardine cans on the beach, fishing in private waters, or other and more objectionable conduct—with the whole world for an audience. In their attitude of contempt for decency and tidiness they are blood kin to the disreputable element among motor campers and picnickers.

Another close relation is the road hog, the blighter who drifts along at a leisurely pace until you want to pass him. Then he spurts and does what he can to crowd you into the ditch. Or, perhaps, he is unwilling to keep his place in the line of vehicles and tries to pass everything on the road, regardless of sense or safety. This fellow has so many disagreeable traits that a weighty encyclopedia would not hold the descriptions of all of them.

These people behave the way they do for a very simple reason, one which does not yet seem to have been generally recognized. The truth is, they are all suffering from an inferiority complex.

(C) Lazarnick.
Part of a public park, decorated with trash left by a picnic party.

(C) Lazarnick.
Billboard used by Motorists' League for Countryside Preservation to promote roadside decency. President Harding was a member of the organization.

The summer camper and picnicker are for the most part unwelcome in the country.

It is this that accounts for the messy camp sites, the stealing of flowers and fruit, and the other painfully evident misdemeanors of some motor tourists, picnickers and boat users. They feel that they are as important and of as high quality as anybody in the world. Deep down is the subconscious knowledge that this is not so. So they try to cover it up by willful depredations which act as a balm to their vanity.

Nothing could come much closer to the ideal method of enjoying a brief breathing spell from the cares of business or household routine than to pile the family into the car and hie forth for a joyous picnic in the country. No saner, more worth-while, or more deservedly popular movement has ever taken possession of the American public than the great and growing sport of motor camping. Boating, whether in a canoe, rowboat, or motor boat, is a pastime without peer for those who love the water.

Can we justly refer slightingly to all the seventy-five or eighty million people who go out auto picnicking or take to the broad highways with their camping trailers, tents, pots, pans, mosquito lotions, and other gypsying paraphernalia? No, we certainly cannot.

When you next hear someone complain bitterly over the depredations, rudeness or dishonesty of motor campers and picnickers *remember it is a small minority which performs the sins for which the great majority is blamed.*

An exclusive clientele went to Huggins, to be curled, combed, shaved and entertained.

# JOHN HUGGINS, King of Barbers

By JAMES ROBINSON DANIELS

ILLUSTRATED BY HARLAN JOHNSON

IN THE picturesque company of unusual characters who have enlivened little old New York, the name of John Huggins gleams forth with engaging scintillations.

Huggins was a wit, a wag, a barber and a self-styled "Emperor." Early in the 19th Century he took to heart the adage, "It pays to advertise." Whether his grandiose or poetical advertisements attracted more customers than his amusing gossip is not known. But certain it is that a fashionable and exclusive clientele went to "John Richard Debrous Huggins, Knight of the Comb, Ladies and Gentleman's Hair Dresser" to be curled, combed, shaved and entertained.

As an oracle of spicy news Mr. Huggins supplemented and improved upon the local press. Unfortunately, his verbal confidences, poured into the willing ears of his customers, are lost to posterity, no Boswell taking down the great man's chitchat. But the announcements which comprised the advertising campaign of John R. Huggins, "Emperor de Friseurs, Roy de Barbers, Autocrat of Fashions," appeared in all the Manhattan newspapers.

*The American Citizen, The Morning Chronicle, The Public Advertiser* and the other members of the metropolitan press in the early 1800's printed proclamations of Huggins the Great.

It is doubtful if Huggins himself wrote more than a small percentage of the ads to which he signed his name. Like some modern business men, he engaged a copy-writer to compose "attention-compelling" advertisements especially suited to his personality. Let us hope that "Emperor" Huggins paid his publicity men right royally.

New York at the beginning of the last century was a city of considerably less than 100,000 inhabitants. State Street, overlooking the Battery, was occupied by the wealthy. Washington Irving was frolicking with the town wits at "Cockloft Hall," No. 17 State Street, his brother's house. John Jacob Astor was acquiring his first half-dozen millions. People were wondering whence "St. John's in the Fields," as St. John's Chapel at Varick Street was called, would get its congregation. The lower end of Broadway contained residences of the merchant aristocracy and the still powerful Knickerbocker families. East of Broadway many high-pitched, gabled Dutch houses remained. The havoc caused by the British occupation during the Revolution had been repaired, and the city was growing.

A commission was laying out the island with streets in the present gridiron pattern. This commission was resolved to plan New York once and for all, notwithstanding, as they said, that "It may be a subject of merriment that the commissioners have provided space for a greater population than is collected at any spot on this side of China . . . It is improbable that for centuries to come the ground north of Harlem Flat will be covered with houses."

Alexander Hamilton at this period would drive down to the office from his country estate, perhaps dropping into Huggins' shop to be shorn and anointed, and to exchange political opinions with Mr. Jay, General Morton, Mr. Livingston and others. Then they might discuss Mr. Jefferson's mismanagement of government with the select circle frequenting the Tontine Coffee House, in nearby Wall Street.

For all the Puritan denunciations of wigs and hair dressings, our ancestors delighted in these vanities. By Revolutionary times women wore towers or "rolls." To make these, the front hair was pulled up over a stuffed cushion or roll, and mixed with powder and grease; the back hair was strained up in loops surrounded and surmounted with ribbons, gauze, flowers, pompons and all manner of decorations. The structure, a thin outer wall of natural hair covering wool, tow, cotton and false hair stuffing, was perhaps half a yard in height.

A New England girl in 1771 wrote of her headdress: "This famous Roll is not made wholly of a Red-Cow Tail but is a mixture of that and horsehair, very coarse and a little human hair that I suppose was taken out of the back part of an old wig. But D., the barber, made it, all corded together and twisted up. Nothing renders a young person more amiable than Virtue and Modesty, with the help of false hair, Red-Cow Tail or D. the barber. It (the wig) makes my head ach and burn and itch like anything."

Despite the fact that perukes made many heads burn and "ach," the "lust for wigs become insuperable." The Gods of Fashion decreed artificial locks, and men, women, children, servants, soldiers—everybody—wore wigs.

So great was the demand for artificial headgear that wigs were made of goat hair and horse hair as well as

human hair. Some of these cost fifteen and twenty pounds for the best grade.

The *London Magazine* gave in 1753 a list of some of the gentleman's wigs then popular: "The staircase, the artichoke, the wild boar's back, the snail back, the negligent." Then there were the bobtail, the fox-tail, the twist-wig, the neck-lock, the scratch, the grave full bottom and the giddy feather top.

The present-day style of bobbed hair for women, increasing barber's incomes and furnishing endless argument, had its counterpart a hundred years ago when women abandoned rolls, cut their hair, and donned wigs. How they had any hair left after the stretching, powdering and greasing necessary to construct those towers is a marvel.

Doesn't this sound like a 1926 maiden's reasons for bobbing her curls? It is from the writing of a young girl in 1800:

"Now mama what do you think I am going to ask for?—A wig. Eleanor Coffin has got a new one just like my hair and only 5 dollars. I must have one. I cannot dress it (my hair) at all stylish. How much time it will save in one year. We could save it in pins and paper besides the trouble. At the assembly I was quite ashamed of my head, for nobody had long hair."

Today the damsels argue: "If I cut my hair, think of all the trouble it will save. Besides, it's the fashion."

But the upkeep of wigs and the curling of bobbed hair cost, and are costing, the proverbial tidy sum.

The cost of dressing and caring for wigs was a heavy expense to the wearer, but a godsend to the barber. When the style of curling or frizzing the hair and mustaches came in, barbers made a good thing out of that too.

There was no scarcity of hair dressers in New York when the Emperor Huggins and elaborate coiffures were in their glory. Some of them, taking the cue from John R. D. H., proclaimed their accomplishments in the daily journals. His Majesty rebuked his imitators and competitors with the following scornful phrases:

"Superficial observers will not readily discover the distinction between a Knight of the Comb and a Barber. To correct minds that distinction will be obvious. The one is proficient not only in embellishing the head and beautifying the countenance divine, but in all the accomplishments of a finished gentleman; the other is a mere Jaw Scavenger, employed to remove the rubbish."

Whereupon the jaw-scrapers doubtless retired in great confusion, unwilling further to incur Sir John's righteous wrath.

For a time Huggins had a partner, one Quirk, and the two embellished the fashionables at No. 41 Pine Street. Like many another man of genius, Huggins had to be all or nothing. Quirk, Sir John felt, lacked that exquisite nicety and perfect decorum essential to the partner of the King of Barbers. So the partnership was dissolved and Huggins betook himself to grander quarters at No. 92 Broadway.

Inspired by this event, the noble Knight of the Comb summoned his private muse and burst into print with the following melody:

"J. Huggins informs all the heads in the State
Of the wonderful changes he has passed through of late;
Promoted from Pine Street's dull glimmering ray,
To the clear shining regions of stylish Broadway."

Mr. Quirk, who had stayed in "Pine Street's dull glimmering ray," retorted in sarcastic allusion to the alleged stylishness of Huggins' new establishment, even hinting that a stable was very near the Emperor's shop. Henceforth the former partners expressed great contempt each for the other.

A chain of barber shops operating in New York today make a feature of the rule that their barbers do not engage in superfluous conversation. Huggins believed in talking over the news and scandal of the day with his aristocratic patrons, but he did not want a loutish assistant to annoy his distinguished customers. In *The Morning Chronicle* of July 19, 1805, he accordingly inserted this notice:

"Wanted—a decent journeyman who has some taste, some manners and is untainted with that most despicable impurity, generally designated slack gab."

It is quite possible that the successful applicant for this position was the same wretch who treated Huggins so despicably. After serving as assistant to the Honorable Huggins and absorbing all the advertising and tonsorial methods practised by the master, this individual opened up a hair parlor for himself. The proprietor, so he announced, was no less than Don Emanuel Antonia De Biscarolaza. Don Emanuel informed a bearded Manhattan that he executed "the buckish scratch, the legal twig, the parsonic curl, the philosophic twist, the medical friz" and a variety of other styles in mustaches and wigs.

The Don was a rogue, though a clever one. *Valentine's Manual of Old*

"Superficial observers will not readily discover the distinction between a Knight of the Comb and a Barber. The one is a finished gentleman; the other a mere Jaw Scavenger."

*New York* remarks that his talents included "the insolvents shift," for Don Emanuel shortly vanished, leaving a number of well-lathered creditors.

However, upstarts came, had their day and went, however the people went after strange gods, Huggins continued resplendent. After the Don's departure the Emperor trumpeted:

"Still Huggins remained unmoved, unaltered; while transient meteors glare and disappear, he still shines forth, steady and uneclipsed, the grand planet of the frizzing world."

"Oh stranger turn, thy beard forego—
Rough beards and queues are wrong,
Man wants but little hair just now,
Nor wants that little—long."

It was merely in a kindly spirit of helpfulness that the King of Barbers informed the world of the true facts about his attainments.

The *Evening Post* of May 30, 1806, carried one of Huggins' most inspired ukases. Throwing false modesty into the Hudson, the Emperor announced:

"Hail Columbia! Blissful Empire to possess at once the institutes of Freedom and the Blandishments of a Huggins! To call him a mere Frizeur would be ungenerous and unjust; he is infinitely more; he is the arbiter elegantiarum and knows that taste, like virtue, dwells between extremes. When he poses his scissors every inconsonant hair trembles at the approaching destruction."

Tooth pastes are a modern invention which our ancestors did without. In early colonial times they scoured their teeth with some such mixture as "Mr. Ferenes rare Dentifrice" which was made according to this prescription:

"First, take eight ounces of Oris roots also four ounces of Pumicestone, and eight ounces of Cutel Bone also eight ounces of Mother of Pearl, and eight ounces of Coral, and a pound of Brown Sugar Candy and a pound of Brick if you desire to make them red; but he did often make them white, and then instead of the Brick did take a pound of fine Alabaster; all this being thoroughly beaten and sifted the powder is then ready to make up into a past (paste)."

Probably the Knight of the Comb sold concoctions like the above, for in the *Oracle and Advertiser* of Feb. 9, 1808, he strummed his lyre to this tune:

"Dressing cases—Rouge for faces,
Oil antique, to make hair thick;
Windsor soap, fit for the Pope;
Eau de Cologne, pulverised bone,
Milk of the rose, brushes for clothes,
Blacking for shoes, papers with news,
And other small articles that make a sum
For I dabble in all and am merry and rum,
And 'tis heigh ho! for Johnny Huggins O,
At eve by the fire, like jolly good cock,
When my days work is done and all over,
I tipple, I smoke and I wind up the clock,
With my sweet Mrs. Huggins on clover."

At this late day it is impossible properly to choose the advertisements which Huggins wrote and those for which his collaborators are responsible. He, or his literary accomplice, described this contribution to the world of letters as:

"Exposing the art of making a noise in the world, without beating a drum or crying oysters, and shewing how, like Whittington of old, who rose from nothing to be Lord Mayor of London, a mere Barber may become an Emperor, if he has but spirit enough to assume, and talents enough to support the title."

Alas, that the *Roy de Barbers* is dead and there is no heir to the throne!

# Why I Left New York

(*Continued from page 6*)

To buy gasoline in New York and not tip the gas-line operator at least a dime entitles one to an immediate ranking of big or little stiff. In singling out one station among many thousands to which to bring your business you may have thought you were doing all that could be expected.

***My Aunt and the Taxi Driver***

You have—except for the dime. Don't forget it, Big Boy! The *free* air price, as I remember, was twenty-five cents.

Of course you don't have to do this. The street parking gouge, the gas, air and water gyp, the garage night-watchman brigandage, the apartment and hotel uniformed doorman hold-up, the dozens of other motor traps may be avoided by a little show of moral courage. "And," as Ring Lardner has remarked, "San Francisco Bay may be made of grape juice."

Every one knows that the New York taxi driver is the cheekiest of his kind. The Chicago gang have their points, I'll admit, but New York, I believe, would win by a few jammed fenders. They are the dirtiest, the most hoggish and insulting in the world. The New York taxi driver is a past master in all the scurvy tricks of the road. For blocking, cutting in, beating traffic signals, emergency stops, fancy skids terrifying passengers and pedestrians alike, and general all-round dirty work, he is in a class by himself.

My elderly aunt from Cleveland, arriving at the Grand Central Station, took a taxi five blocks to her hotel. The fare was fifty cents and standing on the curb she tipped the driver a dime.

"Hey, lady, don't you ever give a real tip?" complained the driver.

At another time my wife and her mother were taxi shopping. One of the between-store trips was so short the meter did not budge from its first reading of thirty cents. On leaving the cab my wife gave the driver forty cents. As he drove away he placed his thumb to his nose. They are brave boys, these taxi buckaroos, in their dealing with women.

Here in the Middle West to own and drive a motor car is a pleasure. The gas and oil stations are clean and sprightly. Many of the employes are university boys. To see that your windshield is clean, that you have air and water, is an important part of their service. They are conversational and cheery. About one thing only are they obstinate. They won't accept tips. It's the same with the men at the garage.

***Intelligentsia Explores Slavic Art***

But this Middle Western courtesy and friendliness may be all wrong. It has the definite effect of spoiling one for New York. I, for example, would never drive my own car there again. I rather would save up and get an armored truck!

My New York relatives who say one can't see a good show outside of New York—although the bad ones I saw there were in a vast majority—also are firm in the opinion that, excluding Boston, certainly, and Philadelphia, possibly, no other city in the United States (except New York) is culturally civilized. They refer mostly to books, music, painting and conversation. The last is by no means least.

I think this is an exaggeration. It has been my observation that more first-rate American writing is done outside of New York than in it. The obfuscatory point is that as the great publishing center sooner or later most writing celebrities visit New York. But they don't work there. Indeed some of them whose royalties would permit them to write and live where they chose have assured me the last place they would choose in which to labor would be New York.

As the focal point of publication, New York has a lusty corps of critics, second-raters, hacks, log-rollers and literary politicians who beat the tom-tom of letters so loudly that sheer noise sometimes misleads the casual observer into believing someone has something to say. Many of this so-called intelligentsia are quite clever; almost all are superficial.

Through easily discernible influences in the past decade there has been a yearning for the importation or imitation of Slavic art, although, speaking broadly, almost anything that isn't American will do. Not that the intelligentsia chooses to explore Slavic art at its source. They merely want it on the half-shell.

***New York Has Drawbacks for Athletes***

I should say that since the general public in the Middle West could never understand their stuff anyway, it wouldn't matter much what these oracles said or thought. And yet it goes a little deeper. If the attitude of these critics *can* affect literary tendencies, some harm is conceivable. There will be too many books going the rounds with the sad note which has come to be so greatly admired in the foreign opus.

The contradictory thing about this is that life in America is not sad no matter what it may be in Russia. And it is an amusing fact that while these young literary revolutionists deplore much that is American, they never feel sorry for themselves. Possibly it has not occurred to them that the objects of their pity do not feel sorry for themselves, either. Thus, while the intelligentsia almost weeps at the mention of a Rotary Club, they perhaps have not had it called to their attention that they themselves are led by a few bell-cows, more sheep-like in their opinions than any Rotarians I have ever met.

There is no part of the Middle West today in which a man may not obtain the best in literature. And he will find more time to read. He can read with less of preconceived prejudice, with less of abominable bustle and bunk.

At the most, culture as an active entity can occupy the ordinary mortal but a small part of each day. I can have opera of Chicago excellence after a few hours' motoring. The art galleries available satisfy my not too sound taste in oils. If any play achieves real distinction it will be out our way sooner or later. The bookshop in our little city is a gem, its proprietor the soundest critic of letters I ever have met. This satisfies your average Middle Westerner culturally.

The terrific inconvenience of living in New York impinges again in the matter of athletics. Here in the Middle West if my telephone rings at two o'clock and at the other end of the line old Bill Jones wants to know how about it, the chances are bright that William and I will be in the locker room of our club at twenty minutes after

two and that at two-thirty we will be driving away from the first tee.

In New York golf was an assassin of time. I happened to belong to a club on Long Island which by rather rapid driving one could reach in one hour and a half from 42nd Street and Fifth Avenue. Three hours were shot in traveling every day I played golf. On those days I was invariably late for dinner or failed to arrive for it at all.

***Little Mary Runs on the Grass***

If, as a bachelor, I had been willing to believe that New York had some advantages, after I was married I could concede it few. I think sometimes that I subconsciously determined to go back to the Middle West on that memorable day—for me—when the park policeman blew his whistle at my fourteen-month-old daughter.

She had learned to walk then and her dad had received the pleasant assignment of taking her to Central Park for an airing. After the zoo and the merry-go-round had been duly visited, Mary's father found an empty bench and, sitting down, began to read. He was dimly aware a moment later of a vigorous blast from a police whistle. Thinking, perhaps, that it was merely another case of an East Side gunman doing his stuff, Mary's dad continued to read. Thereupon the blast was repeated and there was no mistaking an angry note in it. Or if I had mistaken it, the ensuing invitation to "get that kid off'n that grass" could have left me no longer in doubt.

I looked about and, sure enough, Mary had strayed about ten feet off the walk onto the City of Greater New York's grass. So I got her off'n it. I didn't blame the policeman. New York's police force is one of the finest things about the town.

But on the way home I got thinking that I hadn't been raised in a public park like a deer, a goldfish or a water lily, and I didn't see why Mary should be. In my early fiction Central Park had furnished fascinating atmosphere, but here again on the human side I found it heavily loaded with that foreign touch which is seven-

***I Still Live in the Middle West***

tenths a part of New York. Hundreds of brown-eyed kids, better dressed than those of the East Side, guarded by bored-looking governesses and unmistakably not Middle West American.

As Mary grew older, my mental indictment of New York from a Middle Westerner's viewpoint grew stronger. Several of my friends had suffered sudden nervous breakdowns. I was doing better financially in my line than I ever had done. I could not hope to do so well in the Middle West. I would have to abandon certain dreams if I left New York. Yet if some I knew, whose dreams more or less had come true, could be taken as examples, what, after all, was I abandoning? In the Middle West, on less, wouldn't we get more of what I have come to believe are the worthwhile things of life?

My wife, herself a Middle Westerner, was overjoyed. My boss, a New Yorker, thought I was kidding him. If I wanted a raise why hadn't I spoken of it?

"I don't want a raise," I replied. "If I am mistaken about the Middle West I should appreciate it if I could come back here to work. It may be I am wrong about this thing and am merely chasing the ideals of my youth."

"You are," he said. "I'll expect you back in three months."

That was two years ago and I am still in the Middle West.

# King Cotton Goes West

THE devastating presence of the boll weevil throughout the vast Southern cotton belt, particularly in the low alluvial lands of the Old South, and the inability to control its activities except in isolated cases, have caused the growers of cotton to search for new lands to cultivate.

Ever since the great Llano Estacado of Texas and New Mexico was opened to agricultural development, there has been a widespread belief that cotton could not be grown on such a high plateau, where the altitude is anywhere from 2,500 feet to 3,500 feet, where the spring is backward and the frost is early, and where the conditions generally were not favorable to the cultivation of cotton, which is a far more delicate plant than most people imagine. But in the last two years this belief, unfounded as a matter of fact, has been shattered completely, and today King Cotton is rapidly taking over an entirely new domain—a magnificent stretch of country containing thousands of square miles of rich agricultural lands as level as a billiard table, with an ocean of clear sparkling water a few feet under the surface.

In the last few years many sections of the Panhandle-Plains region of Texas, an empire two hundred miles wide and four hundred miles long, hitherto devoted strictly to cattle raising and grain growing, has acquired the cotton fever that is reminiscent of the oil booms or gold rushes.

Out of all the welter of asseveration and doubt with respect to cotton production on the higher altitudes of the Plains region, one fact emerges triumphant: The boll weevil cannot hibernate there, and it cannot withstand the hot, dry months of the growing season.

The Plains have produced tens of thousands of bales of cotton, and from all that may be deduced from past experience they will go on producing it with only the general Southern average of crop failures due to unfavorable meteorological conditions.

Those who uphold the claims of the Panhandle-Plains as a favorable cotton production area point out that in the early geographies of the West that entire stretch of country was set down as a desert, incapable of producing anything. They point to a record of twenty years of successful crop production in small grains and garden truck. They call attention to the numerous isolated areas where shallow wells have been sunk, and where water flows with a greater volume than any of the famous oil gushers of the Southwest. These facts are unmistakable, and may be verified by a brief visit to any of the counties where irrigation has been tried.

Settled for the most part by farmers from the cotton-growing areas farther east and south, the Plains region will in a few years prove one of the biggest factors in the restoration of normalcy in the production of cotton, if the predictions of the more hopeful prove justified.

One fact pregnant with possibilities to the cotton industry of the whole world sticks out like a sore thumb from the present experiments with cotton in the Plains region. If cotton growing there proves profitable—and with a growing season of around 200 days there is no climatic reason why it should not be profitable—approximately 40,000 square miles of cotton-producing land will be added to the world's acreage. Even with a yield well below the Southern average, that would have a bearing on the world's cotton production that would make itself felt throughout the globe.

It cannot be denied that considerable sections of public opinion in the Plains region look askance at the invasion of King Cotton. They see in the coming of cotton a destruction of the well-established diversity of crops, by which the region is made more or less self-sustaining. If the farmers turn from this custom to the ruinous practice of sticking to cotton as the chief crop, many well-informed men predict disaster, a disaster that has been repeated year after year in every cotton-growing section of the South.

In the public square of an Alabama town stands a monument, erected by farmers and tradesmen in loving remembrance of—his majesty the boll weevil. That billion-dollar insect had forced a diversification of crops, to the consequent financial betterment of the community. In a certain Texas county grateful farmers have erected a memorial in tribute to the scrub boar, because the scrub had shamed them into development of purebred swine. Somewhere on the plains, in future years, the armor-plated boll weevil may be immortalized in granite, in recognition of his services in carving out a new empire for the Great White Monarch.

# Does Coffee Harm You?

## Then omit caffeine

Many people know that coffee harms them. It often affects the heart and kidneys. It keeps many awake at night. Millions of coffee lovers have been forced to substitutes.

The trouble lies in the caffeine. That tasteless drug, which adds no delight, is the source of all coffee harm.

Kaffee Hag is coffee with the caffeine taken out. It is pure coffee, a delightful blend. The full flavor and aroma are intact. Even expert tasters cannot tell that anything is missing. It offers a superlative coffee which anyone may drink at any hour without a thought of harm.

Countless homes have adopted it because of its quality. The finest hotels now serve it.

If anyone in your home fears caffeine, try Kaffee Hag. Send the coupon with a dime for a 10-cup package. It will be a delightful revelation. Clip coupon now.

"Detroit, for all its manufacturing prowess, is a perfect flower bed of artists, but Detroit hasn't found it out," said ***the Man Who is famous in art and literature.*** "Detroit is still in the 'old master' stage. A painting must be reminiscent of some old school to be considered respectable. It is now one of the best markets in the United States for second-rate things from Europe—the cast-offs of private homes and public galleries. Oh, a few good things come over, I grant you, but don't be gulled by the tales about American money depleting the art treasures of England—the English are too canny for that. On the other hand, England is gobbling up the best of American art, which Americans do not value simply because it is American. There will be no real art spirit in America until each city encourages its own artists, and it is pitiful how much a very little encouragement can do. Not long ago I was asked to consult an obscure young artist on behalf of a prospective purchaser. The sum proposed was $2,000. 'Oh, don't offer him $2,000,' I advised. 'The poor fellow hasn't seen $200 at one time since he has been in your town.' Art is largely a fad with some of its so-called patrons. I know of an exhibition where a society lady with a flourish offered to buy four paintings and ordered the 'Sold' tags placed on them, with her name. She reigned quite regally during the exhibition, but she refused to receive the pictures afterward. The artist had lost his chance for a year. If they had been 'old masters,' she would have taken them gladly, however atrocious they might have been. Even the newspapers of your town will not interest themselves in the work of struggling artists for fear of 'advertising' them. No, I cannot give your city any credit until its people—not necessarily the rich who can buy, but the plain people who can feel—begin to give attention to the true and unselfish artists working in their midst. Their very spirits are worth cherishing. In their very failure of 'success' they are worth more to your city than can ever be computed. Cannot some one do something to rouse Detroit to a knowledge of what it has in living devotees to the spirit of beauty?"

❦ ❦ ❦

We were speaking of the advantages derived from leisurely travel in foreign countries. I expressed my desire to take my boys to Europe when they arrive at the ages of fifteen or eighteen, in the belief that the trip would be largely educational. ***The Man from the Antique Museum,*** who had lived for some time in France, agreed with me heartily.

"Get a bicycle," said he. "Each of you should have a bicycle and you will find that you can penetrate into remote districts where a car will not take you. You will see the beauties of France, Italy and Spain in a way that you will never regret. Have the boys read Washington Irving's descriptive stories of Spain and his *Sketch Book*. Also Gibbon's *Rise and Decline of the Roman Empire*. They will return home with a better groundwork than they would have if they had depended on the guidebook and sightseeing bus alone. Let them go into rural England, into the downs of Sussex and the wolds of Yorkshire in May when the fruit trees are in bloom and the undulating landscape is fragrant and white with blossoms. By all means they should cycle into the Highlands of Scotland, among the tarns and waterfalls of the historic northland. Then there is Wales, with its mountains and mines, the chalk cliffs of Dover, historic Cornwall. At slight expense you can travel the canals of Holland and Belgium and view the quaint old-world cities and villages at first hand. You will find the natives happy to assist you in every way though they know not a word of English. Too many Americans view Europe on a time-table basis. Monday they will see St. Paul's, Tuesday, the British Museum (and one could spend a month profitably there), Wednesday the Abbey and so on through each country. Take your time whether you are in the rural districts or in the cities. As a means of first-hand education it is perfect; much better than getting it from books. The history of the World War is interesting, but how much more impressive is a view of the Trench of Bayonets? The beauties of Southern France are incomparable if you but have the time to enjoy them and are not on a hard and fast schedule."

❦ ❦ ❦

"No," repeated ***the famous Writing Man,*** "I don't like these 'literary colonies' very well. They are ingrowing; the members have their own little circle and they don't go outside of it; and the work they turn out shows it. So when one began to form near my New Hampshire farm, I sold the farm and moved farther back into the hills. I want to stay close to the people, to the farmers especially. The 'colony' has a tendency to draw you away from them. And then, too, the country people themselves get suspicious of you. They think you are trying to be superior, and first thing you know there is a cold reserve in their associations with you. I worked as a farmer for years and my neighbors never suspected that I wrote a line. They wondered sometimes why I stayed up so late nights, but they didn't know the real reason. And I wouldn't have them, not for the world. I valued their friendship too much."

❦ ❦ ❦

"They say that Holland is ruled by Queen Wilhelmina," said ***A Visitor from Holland,*** "but I know better; Holland is ruled by the Labor Party. The Labor Party goes into power, and then they call a strike. The Labor Government then takes pity on the poor men out of work, and pensions them. The pensions are marvelously arranged. If a man has earned five dollars a week at work, he is allowed eight dollars a week for being idle. Now, even a Dutchman will sometimes be found who prefers idleness at eight dollars to work at five dollars. The next thing is to raise the eight dollars, and so the taxes go up. When taxes go up, the people move out. That is why I am in America, and I brought my money with me. I think maybe I can live in the United States a while before they tax us out of existence here too."

❦ ❦ ❦

***The Poet dropped in and spoke of the coming of Spring*** and the return of the warm sunshine and green trees. Someone had remarked to him that it was an "old-fashioned spring."

"There is no old-fashioned spring," he contended. "Nothing in nature is old-fashioned. Things are old and still are new; they are new and still are old. The sun that shines today is the sun that Joshua commanded to stand still; and by its light Egyptians built the pyramids; and yet each day it rises to us a new sun. So with the mountains and the seas; each day the mountains are robed anew in mist or snow or verdure and ever-changing color; the seas change with every moment. We see so few springs—so very few—that they never can grow old. The present generation has strange notions about these things. It likes to talk about ideas and objects being 'old-fashioned' as opposed to those that are 'modern and up-to-date.' But much of their 'modernism' is as old as the sea. Mix up the good of every age, and it is all new. The real things are without date."

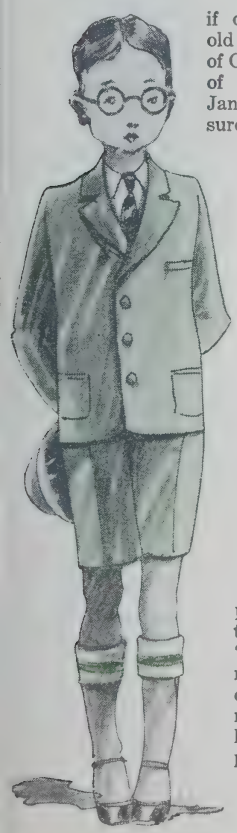
❦ ❦ ❦

"No use looking for a hidden meaning in Sinclair Lewis' rejection of the Pulitzer Prize," said ***the Newspaperman as he breezed into the office.*** "There is no hidden philosophy in it. A thousand stories on a thousand front pages of a thousand newspapers would be worth the rejection of a million-dollar prize; you couldn't begin to buy that amount of publicity for a million. And Sinc got it for a thousand! In doing so he played a better press agent caper than the one he pulled off at Kansas City. When I read about that in the papers, I expected to see a denial. But as none has come, I accept it as having occurred. The story is that Lewis, invited to speak at a church, held a watch on God. He said that he would prove to the people whether there was a God or not. So he took out his watch and gave God a minute to strike him dead. Dramatically he held the watch, and at the end of the minute he was still alive. Deity had not deigned to notice the great best seller. That's the action of a man who is drunk, crazy or just windy-headed. As press agent stuff it is so very stale—not to speak of its bad taste. Lewis hasn't very good taste anyway. He thinks his temporary spurt of fame gives him a licence not allowed to ordinary mortals. He likes to swear when he is addressing a meeting of bishops. He would think it rather original to address his hostess with the choice Babbittry—"Why, you fish, how do you get that way?" as a neat way of expressing disagreement in opinion. I understand that Lewis' next book is to deal with the Christian ministry."

# What's in a Name?

## Some Parents Seem to Think There Is a Good Deal; It May Be the Name of a Greek God, Movie Star or a Prize Fighter; But Children Have Also Their Opinion

By ALICE E. SINCLAIR
ILLUSTRATED BY EDITH GRIEVE



"Sk-illll-man," his mother calls in a shrill voice.

WHAT'S in a name? Do you ever ask yourself this question when you observe the Betty Jeans, the Mary Lees, the Barbara Anns, and the Emma Lous in our midst today, not to forget the Bobs, the Bills, the Dicks, and the Joes?

Some one has said that you can tell a woman's age by her name, for as styles in dress change with the seasons, so do styles in names of the fairer sex.

Call to mind the people you know whose names are: Arabella, Dorothy, Gladys, or Gwendolyn, and I will wager that you can make a fairly accurate guess as to their respective ages. Perhaps you will guess much more accurately than the ladies would answer, were they asked their ages.

Today, instead of forty little Gladyses or Dorothys within our circle of acquaintances, we find forty little Betty Jeans. Tomorrow it will be forty little "Something Elses."

Christopher Franklin Theodore Blank.

On the other hand, if one has the good old substantial name of Catherine, of Mary, of Elizabeth, or of Jane she may rest assured that it will not be her name that will tell us how old she is or is not. These are names that have, like the poor, always been with us.

In a few years or so, the Betty Jeans and Nancy Junes, that are now so popular, will have gone out along with the present styles in automobiles, and other names will have taken their places.

Do you suppose that one of these could be "Radio"? I hope not; it is a wonderful thing, but no name for a nice kid—such as all parents have.

The moral of all this seems to be this: if you are the parents of a female child, do not christen her one of these names that appear overnight and pass on the next day, if you think that she will ever be sensitive about her age.

Styles in men's names do not appear to change. There are as many Pauls, Johns, and Toms today as there were centuries ago. And anyway, men are not supposed to be sensitive about their ages. Not being a member of the stronger sex, I cannot vouch for the veracity of this supposition, but I have my doubts as to its truth in all cases.

Be this as it may, my advice is to name the youngster any decent name you like, provided the child can comfortably bear up under it, for, say, sixty to ninety years at least.

When one sees a living example of the "nut browne maide," a very dark-haired, olive-complexioned young lady, whose name he is morally certain is "Goldie," one wonders what, in the name of all that is reasonable, were her parents thinking about when they gave the girl that particular name.

It is possible that her complexion was not fully developed when she was christened, and that her raven locks had not yet appeared. She may have had an Aunt "Goldie" with looks that fitted the name, and the fond parents may have hoped that "young Goldie" would some day resemble her auntie.

The most phlegmatic mortal may answer to Annabelle.

I know by sight one of these misnamed "Goldies." This girl has a cousin, Sarah, a maiden with red-gold hair and the complexion that accompanies such hair. When these two are together, one wonders at the incongruity of the names. Why is not Sarah, Goldie, and Goldie, Sarah?

Then, there is the little man with the perfectly good name, Christopher Franklin Theodore Blank. One expects to be impressed by the personality and general bigness of the owner of such a name. What is his dismay to see that a small retiring little chap with a still more retiring little voice is the possessor of these names, once possessed by famous men.

He could be called "Frankie," but never would one desire to call him Christopher Franklin Theodore; the idea is ridiculous.

What was his mother thinking of when she named him, you wonder. (Probably of the wonderful man that she expected and hoped her little cherub would become, so to be certain that he would, she gave him the names of a "few" great men.)

Naming a child after a great and famous man is no assurance that the child will become great. Think of how many eminent and notable people there would be on earth today, if every one, or one-half the number, of those named in honor of great men were themselves great. Think of all the poor little Woodrows and the numerous young Teddies, who would have to be famous in order to live up to their names.

Many a poor helpless babe is afflicted with some queer name, such as Skillman, merely because his father, uncle or grandfather happened to possess this lovely name. Perhaps the fond parents see a family resemblance between the babe and the elder Skillman, or maybe grandfather has an oil well or two to give away some day. Again, it may be filial or brotherly love showing itself in a mere name.

But the poor helpless kid has to hear that awful name through life. He hears the hated Skillman almost every time he turns around. "Sk-illll-man," his mother calls in a shrill voice.

"Gosh, why didn't they give me a decent name, Bill or Jack," he mutters. "Sk-illll-man! Bah!"

Then he hears, "Sk-illllll-man," again in louder and shriller tones than he did the first time, so he runs toward the direction of the noise for fear the neighbors, too, will take up the call.

It's queer this one thing about names, but when you hear the name "Ann" do you not call to mind the image of an unassuming, modest, efficient little person who can usually be depended upon in any emergency? She may be beautiful or she may not be; one never thinks of her beauty or the lack of it.

And when you hear the name Annabelle do you not call to mind the image of a tall slender young "fly-

away" who has lots of pep and plenty of romance in her make-up? More often than not, this image is a beautiful one to look upon.

Yet the most phlegmatic, morose, unattractive mortal in the world may answer to the name of Annabelle, and the Ann you actually know may be several varieties in one of a young dare-devil.

When the novelist creates his dashing, brave young hero he never calls him Percy. Why? Simply because Percy does not sound dashing and brave. Exactly why it does not, I cannot say. It just doesn't; that's all. But Harry, Ted, and Jesse do sound dashing and brave, and so our hero is named some such name, as one of these.

Not so long ago a young lady got into print with the idea that a person's character is much influenced by his name. For example, a girl named Juanita would have a much more alluring personality than would one who possessed the name Martha. Juanita would be gay, romantic, and vivacious; Martha would be quiet, serious, and grave.

Juanita would demand and receive more from life than would Martha. In other words, this young woman would have us believe that we react unconsciously according to the nature of our names.

Should you follow this young lady's teachings undoubtedly you would give your little daughter the name of Suzanne, never the one of Susan; your son, the name of Donaldbain, never the one of John. But beware of this "name" psychology; you may get stung.

Some parents choose the name of a Christian saint for their child; others, that of a Greek god; others, that of a movie star; others, that of a prize fighter; others, that of a historical character; others, that of a current political character; others, that of a relative. Still others give their child a name that they admire simply for the sake of the name itself.

What's in a name? I am frank to say that I do not think there is anything in a name itself. A name may mean much to you or to me, but to the other fellow it may mean nothing more than a name.

We will continue to name our children to the end of time, just as we do today, various names for various reasons.

The names may fit or they may not, but, at least, everyone will have a name. And when all is said and done, what more is necessary than that each one of us have a good old Christian name of one sort or another, so that he can claim a personality of his own?

## Estimate of Animals and Insects

SCIENTISTS now estimate that there are 600,000 different known species of animals in the world, one of which is man. In 1830, Professor Gunther's estimate of the number of known species was 78,588. He made a list to cover those which had been discovered up to that time.

Scientists and explorers keep adding yearly to the total, and it may reach a much higher figure than at present. The number of kinds of insects is even more startling. In 1905, the naturalist, Sharper, made a list of a quarter-million insects, and at that time he declared his belief that he had listed not more than a tenth of the actual total.

ants show distinctly varying moods. On one occasion while observing the nest of *Formica rufa* in the Insect House I wished to mark some of the ants, so, choosing a time when there were a number feeding on raw meat, I placed a dab of Chinese white on the thorax of six major workers. The paint was so thick that each ant was lifted into the air on the tip of the brush. Five of the six were quite unmoved by this treatment, and when restored to *terra firma* continued feeding as if nothing had happened; but one, on the contrary, showed deep resentment, and ran round with jaws wide open looking very fierce, and threatened all the workers in the neighborhood. Suspicion fell on one worker which passed carrying another worker to a special piece of work (as is the habit of this species), and the indignant ant followed them, touching them repeatedly with her antennae. Finally, as these threats were unheeded, she seized the burdened ant by the leg, and the latter was obliged to set down her load and menace the quarrelsome creature with her jaws before she could proceed with her own business. All six ants had received precisely the same treatment, but only this one resented it.

* * *

as showing that politics are the same the world over, here is a Tokyo dispatch:

The fifty-first session of the Japanese Imperial Diet differs from previous ones in that the fights were very few, but it beats any others for the number of scandals, big and small, that it has had to debate.

The greatest of these scandals was that in which General Baron Tanaka, today head of the Seiyukai party and formerly a Minister of War, is charged with having peculated millions of yen belonging to what is popularly termed the "secret chest of the War Office." Along with General Baron Tanaka is also implicated General Yamanashi who, too, was a former Minister of War.

Yukio Ozaki, at one time Minister of Education, made one of the finest speeches he has yet done in which he accused General Baron Tanaka and General Yamanashi of having used the major part of the War Office's secret chest for the electioneering fund of the Government of that time.

"I was once a Cabinet Minister under the late Count Okuma, and so I know something about the expenditure of secret funds. I used such a fund, amounting to Yen 150,000, which was set entirely at my discretion. The main purpose of our Siberian Expedition was to rescue the Czecho-Slovak soldiers, and there was no formidable enemy that we had to deal with. Field-Marshal Count Terauchi used only Yen 3,000,000 as secret funds during the Russo-Japanese War, but General Baron Tanaka used the huge amount of Yen 24,000,000 during the intervention in Siberia. How was that fund spent? It is a fact that there was a dissolution of the Diet when the late Premier Hara was steering the ship of state. It is a fact, then, Baron Tanaka was Minister of War. Now dissolution of the Diet means a general election and general elections in this country are costly luxuries. I am inclined to believe that there is a connection between all this and the expenditure of this vast amount of the nation's money."

There are also freaks in all kinds of politics. One Japanese solon finds a day's publicity in denouncing foreign dancing. The Tokyo dispatch continues:

One Japanese champion at least has taken up the cudgels on behalf of foreign dancing in Japan which the exemplary solons of the Diet want to put in the crime category through legislation. Writing with an irony that would have graced Jonathan Swift, he enumerates the total number of fights the Diet has enjoyed, the number of cracked heads, the number of sprained wrists, the costs to the taxpayer that these fights have caused and the number of hospital beds that had to be given to Diet rowdies. He then asks why the members are unable to see the wisdom of securing legislation that will make fighting in the Diet as criminal an offence as fighting in a public thoroughfare.

"Our parliamentary representatives," he writes, "are a magnanimous lot. The reason why they want to have legal restrictions on modern dancing is 'to preserve the good manners and beautiful national customs of the Japanese.' Hurrah! Then, calling names and fighting like Billingsgate women in the Diet must surely be good manners and beautiful national customs! Which is more detrimental to the good manners and beautiful national customs of the Japanese—dancing or these shameful Diet brawls?"

The writer then goes on to point out that it is the custom for high officers and Diet members to congregate in *machai* (houses of assignation) there to talk State affairs while a group of questionable women pour saké and listen, or to plot party feuds. "This, no member of the Diet can deny," he goes on, "and the public knows that it is here that the scheming is done, that the plans are discussed to buy off someone from the other side. Perhaps," he adds sarcastically, "a pretty *geisha* is thrown in to make the offer more tempting. All these, of course, are done in accordance with the 'good manners and beautiful national customs of the Japanese.'"

# Gadzooks! They Were Gallants Gay

(*Concluded from page 13*)

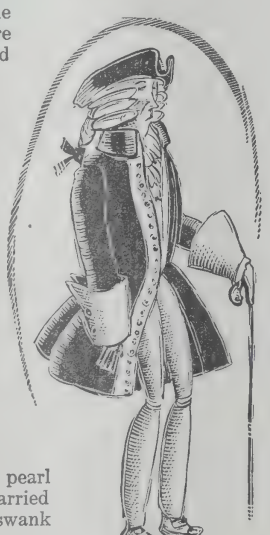
Paris, gave entertainments of fabulous magnificence . . . The general would not

admit the presence, at these far-famed balls, of any woman whom Nature had not gifted with exquisite outline and well-rounded form."—*Confessions*, Arsene Houssaye, 1867.

"The Turban Bearer to the Grand Signior holds a very conspicuous place in several of the grand processions of the Sultan, who has always two turbans carried before him. They are placed on a sort of tripod and borne in the right hand by the two officers appointed for that purpose. This ceremony, which at first only originated for the purpose of giving the Sultan an opportunity of changing his turban, if he chose, has now become a matter of ostentation. And as different officers of state and others pass them, they make a most profound reverence, while the Turban Bearers take care to incline the turban a little to the right or left as they receive the homage . . . All pay the most humble respect to the sultan's turbans, which are very rich, and ornamented with feathers."—*Picturesque Representation of the Dress and Manners of the Turks*, 1814.

Eighteenth century—Joseph Browne, with a slim waist like a young maid of honor's, wrapped his shrunk shanks in a name in an Indian banyan, and wore three pairs of thick stockings when he walked abroad."—*Two Centuries of Costume*, Alice Morse Earle.

"I wore my russet-brown greatcoat, vulgarly termed the overcoat, my pearl white London hat, and I carried with a certain Fifth Avenue swank an ivory-knobbed cane.



"As the final 'wow' I wore a zebra-striped collar. It was the one that caused a dowager at a theatrical first night to lift her lorgnette at me from a box and exclaim, 'Fawncy!' I'll say it is. Also giddy."—*White Light Nights* by O. O. McIntyre.

"He (the Duke of Newcastle) accoutres his person according to the fashion, if it be one that is not troublesome and uneasy for men of heroic exercises and actions. He is neat and cleanly; which makes him to be somewhat long in dressing, though not so long as many effeminate persons are. He shifts ordinarily once a day, and every time when he uses exercise, or his temper is more hot than ordinary.

"In his diet he is so sparing and temperate, that he never eats or drinks beyond his set proportion, so as to satisfy only his natural appetite; he makes but one meal a day, at which he drinks two good glasses of small beer, one about the beginning, the other at the end thereof, and a little glass of sack he also uses in the morning for his breakfast, with a morsel of bread. His supper consists of an egg and a draught of small beer. And by this temperance he finds himself very healthful, and may yet live many years, he being now of the age of seventy-three."—*Life of the Duke of Newcastle*, written by his Duchess. (Reign of Charles I.)

"Since they moved to the Riverside apartment, Jimmy had also been living with them. Minnie loved his happy companionship; he was looking very smart now in the suits she was buying him, derby, spats and cane. On his birthday, Minnie had given him a silver cigarette case and Jimmy had bought himself a long amber holder. He always wore a silk monogrammed handkerchief in the pocket of his coat and carried chamois gloves. The only work he did was to call for Minnie at the studio and take her out to dinner and dancing almost every evening."—From *Minnie Flynn* by Frances Marion, 1925.

A Turk in a Pelisse—"These robes, called pelisses, are now very generally worn even in Constantinople. The common artificers, soldiers, and countrymen, not only have pelisses of lamb or sheep skins, of the furs of cats, or squirrels, &c. which they wear in winter, but also made of the skins of wild foxes and hares; the latter are generally worn by the common citizen: the price of these varies according to the colour, quality, and length of hair. The ermine, the common marten, the white fox, but particularly the sable, are found in the wardrobes of rich and distinguished people.

"The Turks very often change their outside habits at different seasons of the year, and it is never the business of fashion, but etiquette, to assume, or leave off, the various robes. The days are fixed every year by the Sultan. The day he changes his sort of fur which is generally on Friday, when he goes to the mosque, an officer of the seraglio goes in form to the Grand Vizier's, and acquaints him of it; when the whole court immediately do the same."—*Picturesque Representation of the Dress and Manners of the Turks*, 1814.

At the time of the American Revolution—"The face was of course clean shaved; and the hair powdered and cued. Stores of flour and tallow for the hair of the common soldiers were issued to each company; each man was allowed a half a pound a week. Those whose hair was not long enough had false cues of chamois leather with a tuft of hair at the end which was spliced or fastened on in some way . . . Sometimes a whole company, as of gunners, would wear false cues of strong black leather which were cleaned and polished with the shoes. When whiskers were allowed a string was stretched from one ear through the lips to the other ear; all the beard below the string was shaved."—Alice Morse Earle.

"The flappers dabbed the Prince of Washington Square affectionately on his back, and two of them were brazen enough to osculate him on his rubicund jowls, much to his social contretemps . . . Most of the cake-eaters and flappers were collegians, and the rest were seniors in high school. The cake-eaters wore their stylish hats, becoming light suits, odd-coloured vests and heavy brogues. Whenever the cake-eaters were financially embarrassed—and that occurred quite frequently, due to their extravagant habits—they would coax their flapperish friends out for a ramble through the park."—From *The Prince of Washington Square* by Harry Liscomb, 1925.

At the Follies on the Opening Night—"The high spots: Heywood Broun, the critic, on the aisle spurning the conventional dress. Ray Long, the magazine editor, in his celebrated plush-trimmed dinner jacket. Frank Munsey in full evening regalia. Dolly Madison, the society reporter, his cherubic face abeam. For Dolly is really Morrie Paul, who has a triple-ply social standing. Reggie Vanderbilt and his white silk vest. Gene Buck and his merry greeting."—*White Light Nights*, by O. O. McIntyre.

"The characteristic long hair of the men was apparently sometimes coiled up on the top of the head, but, even when the wearer was engaged or about to engage in active work, it was ordinarily worn hanging down the back to the waist or below it, usually loose, sometimes in plaits or curls. On the head fantastic knots of curls, like those of the women, were often worn—the 'horns' of which Paris was so proud. This coiffure was as characteristic of the Bronze Age Cretans as was the waist cloth . . . " an appearance as distinctive and as characteristic of racial custom as the shaven heads, wigs, and white garments of the Egyptians, or the oiled locks, beards and parti-coloured robes of the Semites, their contemporaries.—*Ancient History of the Near East*, about 2000 B. C., H. R. Hall.

# Hunting Strange Things

## Walter M. Cline's Quaint Quests

By HARRY

Walter M. Cline at work in a historic spot.

WHEN it comes to picking a hobby, most men are skittish about getting away from the fashion. They round up canes, as an instance, or bits of peculiar china, or one of a dozen things that could be mentioned without giving very much thought to the subject. So that taking a mass view of these quirks, they're sort of humdrum—they bunch too much around the same things.

Walter M. Cline, however, struck out into a clear field when he took on a fad. Off and on throughout the past twenty years, he has been ranging the mountains of Tennessee and the Carolinas, running to earth a lot of strange things that found their last refuge there, as well as a lot of other strange things that naturally flourish in these highlands. Whatever Mr. Cline found, he recorded it in both still and motion pictures. And he's still at it.

Now that's his hobby. A colorful crochet, looking at it from the outside. But taking the hide off, to an ordinary observer, it shows up to be more of a back-breaking, leg-straining job than it is a hobby, because Mr. Cline's hunting grounds are the most rugged country east of the Rockies. The things he seeks are hidden in the most inaccessible places. The greater part of the time, there is no other way to transport his food and camping equipment, as well as his photographic paraphernalia, except upon his own back, and upon the backs of two or three mountaineers, who have been his rambling companions from the beginning. Climbing the steep sides of mountains; slipping and sliding—that's the job end of the hobby.

A hobby loaded with adventure, to boot. For instance, an occasional avalanche carries Mr. Cline down a mountain side, and now and then it slams him against a tree by way of stopping his descent somewhere between peak and valley.

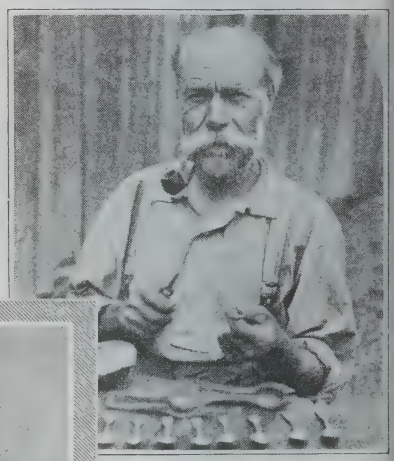
"There are a lot of animal characters back yonder in the mountains, and everybody knows them, sometimes by sight, but generally by their tracks, and the uncanny ways in which they elude both hunters and traps," said Mr. Cline on a recent rainy afternoon that was made to order for talk. "Putting the hours together that I've spent trying to get photographs of these animal characters while they were doing some typical thing in what you might call their own front yard, I suppose the hours would count into months of time.

"The character I paid the most attention to for a while," he continued, "was a tremendously big bear. Everybody in the mountain knew about him. Every hunter wanted the honor of 'getting' that bear, so he was forever being chased. But every hunter failed to 'get' him, because the bear was too canny for even the most experienced hunters.

"Now I didn't want to kill the bear, but I did want to get his picture while he was at home, so to speak, and doing something bearlike. One autumn I camped for a week near a big thicket that was one of the bear's hangouts. Every morning, I'd take my rifle and camera, and food sack, and scout around for that bear. And I'd stay out until it was too dark to take pictures. Sometimes, I'd get a long way from camp.

"One morning, about ten o'clock, I thought I'd located the bear. In the excitement of the moment, I dropped my rifle and food sack, and edged around the thicket to a point where I could take a motion picture. I got set, and was on the alert for the bear to come within range of the camera—when a pack of wild hogs came along. Now they're dangerous. They'll kill you if they have a chance, and likely eat you in the bargain. The leader of the hog pack stopped, looked at me, and I looked at him. Then he lunged at me. The pack followed. I let go the camera and climbed a tree. I wasn't close enough to my rifle to get it. Nor could I get my food sack.

"The hogs circled the tree, champing and frothing at the mouth, even attempting to climb it. It wasn't a very big tree, and I was afraid they'd either shake me out of it, or the limbs would break, and I'd go tumbling down into that wild, squealing mass. I managed to hold on, however, and the limbs didn't break. After a while, the hogs settled down around the tree, evidently waiting for me to make the next move. I couldn't. I thought, though, they'd leave in a little while, so for a time I rather enjoyed the adventure.



"But the day wore on, and the hogs hung around, eyeing me, and grunting. Night came, and they remained. It was cold weather, and I began to grow numb. I wanted to go to sleep, but didn't dare, for fear I'd fall out of the tree. And I was hungry. I yelled until I was hoarse, but I was too far away from camp to make myself heard.

"Well, that was the longest night I ever put in. When I didn't get back to camp at dark, the men who were with me started out to see what had happened. Of course, they all took the wrong directions. It was broad daylight when I heard them yell, and I answered. The hogs were still in the vicinity of the tree, waiting for me to come down. When the men got there, they began shooting, and the hogs ran away."

"And how about the picture of the bear?" was the natural question.

"I never got another chance at him."

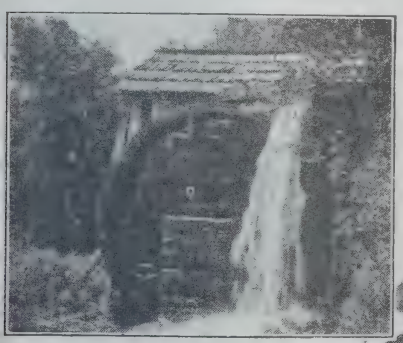
# —Spoons, Pitcher Plants



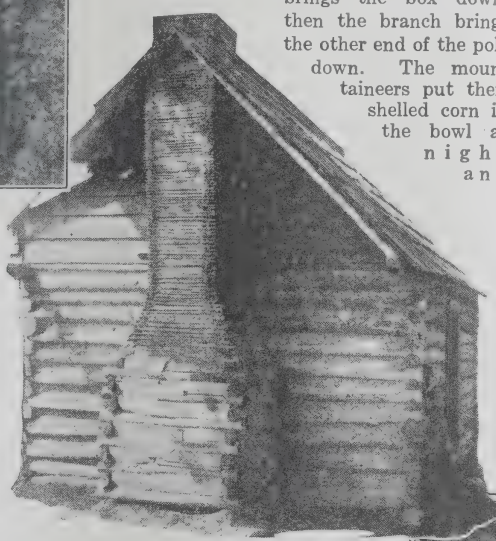
## Discoveries in Queer Corners

E. BARNET

Mr. Cline scouting for "locations."

he sees the results of Mr. Cline's hobby is that it has turned him out, a finished specialist in spookiness, for the films are run in the darkened living room of his home, which is situated in a little clump of pine forest, near Chattanooga, Tennessee. The structure is built of peeled pine logs and poles, cut down to provide the site for the home. The cracks between the logs and poles are chinked with concrete. Partition walls between the rooms are of like construction. The primitive character of both exterior and interior walls has not been lessened nor destroyed by any covering. There is a gigantic fireplace in the living room. On cool days, and throughout the winter, it is half-filled with blazing pine chunks. In a chimney corner is a Dutch oven —a primitive, and once highly thought of,

baking and roasting affair that is nothing more than an iron pot, with a tight-fitting lid. When it is filled with sweet potatoes, by way of illustration, and the lid securely fastened, the oven is covered with live coals. In a short time, the potatoes are roasted.



"We have all the modern conveniences," Mr. Cline explained, when the Dutch oven came in for attention, "but they're kept in the background as much as possible, because we want to preserve the pioneer look of our home. My kiddies think there is no food that tastes quite so good as the bread that is baked in the Dutch oven, nor the sweet potatoes roasted in it. So we use it in every way we can."

Old rifles—dozens of them—hang on pegs driven into a wall of an offset from the living room. Flintlock guns, ancient pistols, powder horns, some of them fantastically carved by Indians; hunting knives—and each member of this collection has its romantic story. Bear pelts, with the heads attached, and the pelts of other animals of the mountains, are scattered on the floor. Books, printed along in the 1820's, the 1830's and the 1840's, fill a row of shelves, themselves resting upon pegs driven into the walls.

There was the old pounding mill. Men built it before one's eyes. A log, about two-thirds the height of a man, was set upright near a small waterfall. The upper end of the log was hollowed, to form a bowl. Near the log, a post was driven into the ground, and a long pole was pivoted on the post. Dangling by a strip of rawhide from the end of the pole nearest the hollowed log was a short, heavy branch of a tree, which overbalanced that end of the pole, and caused it to drop the heavy branch into the bowl, like a teeter-totter with a small boy on one end, and nothing on the other. Then a shallow box was built with one end left open, and attached to the far end of the pole. The box came beneath the waterfall. The mill was ready for business.

A bag of shelled corn was poured into the bowl of the upright log. Water slowly filled the shallow box, and brought down that end of the pole. The water ran out of the box at the open end of it, the other end of the pivoted pole went down, and the dangling branch thudded upon the shelled corn in the log-end bowl.

"That game of teeter-totter between the heavy branch and the water goes on and on," said Mr. Cline. "First, the water brings the box down, then the branch brings the other end of the pole down. The mountaineers put their shelled corn in the bowl at night and

Above—An old overshot water wheel. Center—A mountain home, showing its carcfully constructed wooden chimney. Below—Where three states meet, Alabama, Georgia and Tennessee.

by morning the branch has crushed it into meal—coarse meal, it is, but it makes wonderful corn bread."

As proof, the next bit of history one sees is a mountain woman, mixing the corn meal, and putting it in a Dutch oven to bake. From the looks of the bread after it is taken out of the oven, one has missed a good deal if he never has tasted corn bread, made from meal hammered out in a pound mill, and baked in a Dutch oven.

Probably the best notion of the ingenuity of these pioneer people is gained from a lathe, used in turning out rungs for chairs. A springy sapling is bent down, and a long strip of cowhide, with the hair left on, is attached to the top of the sapling. The other end of the cowhide is attached to a foot pedal. A crude bench, chopped out of a log, holds the rough piece of timber that is to be fashioned into a chair rung. The cowhide strip is given a turn or two around the timber, the foot pedal is depressed, and when the pressure is removed, the sapling flies back as far as the strip will permit. The piece of timber revolves; and by keeping up this sort of movement that is like one-pedal-bicycling the cowhide strip finally turns out a piece of work that is as smooth as a peeled onion. Other lathes are simple contraptions, made from abandoned wagon wheels.

Again, one sees spoons made of pewter. It is melted in a small pot, set in the ashes of a fireplace. The molten metal is poured into molds, and in a jiffy the two halves of the molds are separated, and there is a spoon. It has a tip at the bowl-end, where the metal was poured in, and this tip must be trimmed off with a knife.

Along with spoon making, there's candle making, carried on in the same manner that candles were made in the days of Washington. Twelve candles are molded at one time, in tubes. The wicks are twisted wool.

All the steps of basket-making are shown in the films, from the first selection of oak, made along the stream; the small trees felled and carried into mountain homes, where they are sliced into ribbons, and the making of a basket begins, on to the completed basket, made from green wood-rib-

bons, so that when it dries the basket contracts, and becomes almost water-tight.

Mountain sheep herders are shown; then the shearing of sheep, in which women are more expert than men; and the preparation of the wool, on to the weaving of the cloth, and, finally, the cutting out, and making of a dress, and of a man's suit of clothes.

To enumerate all of the homely things Mr. Cline has recorded with his camera, however, is out of the question. But he has also touched the spectacular, for example, in showing all of the steps of successful trapping—along with it, the education of the small mountain boy, who is shown every bit of woodscraft known to mountaineers.

*Some Wonders of the Pitcher Plant*

In later years, Mr. Cline has made a deep study of the caves of the mountain country that he has come to know so well, and he has made motion pictures of their wonders.

Quite recently, he has embarked upon a new venture—recording in motion pictures the home life of strange plants of the mountains. There is the pitcher plant. Nature provided it with an umbrella, which is hoisted and unfurled above the plant in both good and bad weather. The idea of the umbrella is this: The pitcher plant is a long tube, in which there is a sweetish fluid that attracts insects. They enter the tube, and are entangled. In the course of time, the insects are reduced to a pulp, and they are the food of the plant. The umbrella keeps rain and dew out of the tube, so that there is no interference with the working power of the sweetish lure.

The pitcher plant is a mere clod, comparatively speaking, when it comes to securing its food. It merely offers an attraction to insects, and lets them complete the job.

The plant with brains, so to speak, is the Venus flytrap, which grows in damp and sandy belts in the Carolina mountains. The film of its everyday life is another element in the spookiness that surrounds the results of Mr. Cline's hobby, for the flytrap eats bugs, caterpillars, and any member of the varieties of creeping, squirming, flying small life of the highlands. Each of the plant's leaves is a perfect stomach. When they are not digesting food, the leaves are open. A sticky substance lures the game. Within the leaves are three tiny prongs. When they are touched the first time by a struggling bug, or whatever the prey may be, nothing happens. With the second touching the leaf begins to close. There are fringes upon the edges of the leaves, which are shaped like the two halves of an oyster shell. As the leaf closes, these fringes form bars, which normally prevent the escape of anything upon which the leaf is closing.

Mr. Cline, however, was able to record a near-tragedy of the mountains, when a caterpillar made his escape after a terrific battle. The leaf showed humanlike determination, and no small amount of fighting tactics. And, by opening the leaves now and then during the process of digestion, one can see about the same process going on that goes on in his own stomach, the details of which Mr. Cline has faithfully recorded.

*Nature Carves a Likeness of Franklin*

Probably the most interesting of all of Mr. Cline's films is a series upon which he is at work, and which he says is to be a record of Nature's attempts to be human.

"She builds natural bridges, you know," he states, "and turns sculptor, as in the case of the Ben Franklin rock over here in the mountains, which she carved into a surprising likeness of Franklin."

In making these films, Mr. Cline does not merely show the completed handiwork of Nature. He has studied the manner in which they were made, and he spends hours of time attempting to show the ways in which the results came about—running water, in most cases, which carried away the softer portions of rocks, and left the outlines as they are today.

"At the present time, I'm working on a film showing the family life of ravens, and on another film which will record the old superstitions and old sayings of the mountain people," he added.

Between times, on spots where they occurred, Mr. Cline has staged motion picture revivals of historic happenings, and his children, together with Mrs. Cline, for their own amusement, are always at work upon a film or two, which show episodes of pioneer mountain life.

*Delight in Staging Historical Films*

It is not, however, until the films have been run, and the lights are turned on again in the living room of Mr. Cline's home that the tremendous patience of the man strikes one with considerable force.

"Sometimes I get an idea for a film," Mr. Cline stated, while he anxiously peered into the Dutch oven upon the hearth to see how some roasting sweet potatoes were coming along, "and it takes me two or three years to finish it.

"Lately, I've furnished quite a lot of data and material for historians, together with pictures for their books. It requires an immense amount of hunting in the mountains to get what they want, but now I'm so familiar with the country that I know about where to go to get it, and I'm the only man who has penetrated most of the inaccessible country down here with a camera.

"My kiddies delight in staging these little historical films, and since I've begun to make motion pictures of bugs and birds, it's seldom that I come home from my business in Chattanooga that they miss having a new bug for me to study. They've been stung and bitten by almost everything there is in the bug line down here in the mountains—but they enjoy their bug studies."

Putting a big chunk upon the fire, Mr. Cline said: "And the reason for this home is that we're all history fiends, and we like to live as close to the early type of it as possible."

# They Find New Ideas

(*Concluded from page 7*)

tested. Each of these concerns is hunting for young men with no manufacturing experience to come into their planning departments with fresh eyes and new ideas.

You have seen this working out at a ball game. From your seat in the bleachers you have seen much more of the game and understood it much better than the man at the bat whose sole thought was to swat the ball, or the pitcher who was occupied with the aim of fanning the batter.

A large New York banking corporation knows the value of fresh eyes and new ideas. They have engaged, at a large salary, a young man of thirty-three who is to coördinate the work of their branches and simplify many of the cumbersome details. Did they get someone for this work who had been in banking work all his life? The first he had seen of the inside workings of a bank was after he had been hired! They did not want a man for this important job who had ingrained habits of thinking about bank work.

A very peculiar thing is that one of the first changes he ordered was one that had been suggested by a twenty-two-year-old clerk eighteen months before. The young clerk's chief laughed at the proposal. It was inevitable, he thought, that for the first three days of each month the group would have to work almost twenty hours a day to summarize and verify their foreign clearances.

The outside consultant, however, without knowing what the young clerk had suggested, ordered almost exactly the same change, with the result that a fan-fold system is now used and a perpetual balance and verification is maintained with less effort than was required in the old system.

Fresh eyes!
New ideas!
USED!

Where are new ideas to be found? By looking for them, by thinking, by observing.

At a recent meeting at which the present pioneering work of the American Engineering Standards Committee was being discussed a typewriter company had half a dozen men, expenses paid. They were looking for new ideas. They always have. Result: one of the first factories in America that foreign industrialists visit.

Do you visit the farms and plants of others, not looking for things to criticize, but for new ideas? Have you found them in extension courses, at institutes, at farm bureau meetings? Have they been thought over in the quiet of the long winter evenings or while resting from the hot midday sun in summer?

Have you acquired the habit of looking for them, of testing them, of using them? If you have, then I suspect you do not complain of your business being poor.

# The Abbey Theater Finds Sean O'Casey

(*Continued from page 2*)

(C) *Ewing Galloway.*

rom Act 3—*Juno and the Paycock.* Johnny Boyle, suspected of eachery to the Republicans, is taken away forcibly by two Irregulars, to be found shot the day following.

ushed behind the scenes to make inquiries. Ie learned that the actor had been in the abit of hanging the hen out of the window very night on a piece of string and that hat morning when he had hauled up the tring, the hen was gone! Thus passion and aughter go hand in hand in Ireland.

After annual performances for three ears, the Irish National Theater Society as formed and Irish actors were trained. 'hanks to the generosity of an English- oman, Miss Horniman, the society ac- uired a permanent theater building— art of which had been the Mechanic's nstitute—and a temporary subsidy. The uilding is a common, gray, rather gloomy- ooking place close to the murky Liffey nd in one of Dublin's mean streets. Part f the site had been occupied by a morgue

nd one night during a erformance of *Countess athleen* one of the actors eclared he had felt an nvisible hand clutch his houlder!

The interior of the heater can have changed ttle during the past wenty-one years, for the ociety has had hardly nough money to carry n. There are the stalls, he pit, the gallery, hard eated and tightly packed. 'he hall is high and bare. 'he naked walls are mpty, damp and red. 'here are iron rails. 'here is a strange smell, lmost the smell of dis- nfectant, a chill, cellar- ke smell. The red- eathered seats creak and oosen in the iron frames. ne shivers. Somehow in his nude, shabby air ne feels the thrilling ouch of expectation and drama, with an intensity one rarely experiences in other theaters. Here, indeed, "the play's the thing." There are no detracting luxuries or comforts to lull the mood. One is alert. One has gone to the play, not to the theater.

The gong crashes and the curtain leaps up, revealing a corner of Irish life where there is weeping and talk and laughter. One feels a cold draft from the stage—and it seems the chill clarity of Irish hills is blowing in under the doors of the cottage and through the windows.

The training of actors for the declamation of poetic drama is no easy task. Nearly all the Abbey Players had, and still have, other occupations during the day, in offices, shops, warehouses and other places, and are free only in the evenings. Salaries have of necessity been extremely low. To act in the Abbey has been essentially a labor of love. The Abbey has really only recently come into its own, for under British rule it was regarded with suspicion, and wealthy and presumably educated Dublin tended to ignore it. There was a small literary coterie of supporters, and a few bold explorers from the territories of Dublin respectability. But as the caustic poet wrote:

> "In this theater they has plays
> On us, and high-up people comes
> And pays to see things playin' here
> They'd scut and run from in the slums."

Then came the Anglo-Irish war, followed by the civil war, when it was often dangerous to be out after dark. Some nights the house would be nearly empty and the firing of blank cartridges on the stage in *Arms and the Man* would bring forth hysterical laughter from a nervous audience which would probably have to go home to the sinister orchestrations of roof sniping. But, thanks to the tenacity of Lady Gregory, W. B. Yeats and Lennox Robinson, the theater has pulled through and its position has recently been made comfortably safe by a state subsidy of £800 a year.

One of the most romantic stories in the Abbey's history is the story of the discovery of Sean O'Casey, whose *Juno and the Paycock*, with Sara Allgood as Juno, has been receiving ovations in London. The Abbey discovered Sean, as he is affectionately called, pulled him out of his Dublin tenement, and he is now hailed as the greatest Irish dramatic find since Synge.

Sean O'Casey is a workingman. For fifteen years he was what is called an unskilled laborer, working with pick and shovel on the railway, and taking any job that came along. He, like the Abbey, lives on the north side of Dublin—by far the less "respectable" side of the city. One has to cross the Liffey and penetrate those streets and squares of tenements which were, in the 18th Century, the mansions of Dublin's aristocracy, and which now are slums. He lives in the sordid, appalling Dublin where Jim Larkin became the popular god, and knows by his own sufferings the conditions in which the city's poor live.

I went to see him one morning and found him living in one room on the ground floor front of a typical and dilapidated tenement. The hall was dirty, the walls stripped and greasy, the stairs treacherous and dingy. Noises rattled and echoed like sounds in an attic. Mr. O'Casey having just got up—it was eleven-thirty in the morning—was sitting in his workaday clothes, collarless and unshaven. His thin, fair hair was standing up on end, and to my apologies for, perhaps, interrupting his work, said, "I hate work. I only write to save myself from the sin of sloth."

He has large, level eyes which narrow unexpectedly from time to time. He has a habit of tilting up his chin and looking down his face at one. He has always been a great reader and the walls of his room are lined with well-stocked bookcases. He talks lightly, drawing his prejudices and ideas from his observations of wide slum life, and laments his lack of education. He speaks with a Dublin brogue—he has scarcely been out of Dublin in his life and has never been to England—and, like a true Irishman, enlivens his sentences with fiery expletives.

Sean O'Casey told me how he was always lazy, how he hated work and would do anything to escape it, in order to sleep or read or dream or go for walks in what sun there is in Dublin. He early got into touch with the Gaelic League, and tried his hand at writing. His efforts, he declares, are the crude work of an uneducated man. But undaunted he watched and studied his fellows, and read and read, till in a spell of unemployment he began

(C) *Ewing Galloway.*

From Act 1—Members of the Boyle family, in their two-room tenement, are listening to the will left by a rich relative, bequeathing to them several thousand pounds. Through a flaw in the document, the Boyles never received the money, and were thrown into debt with merchants who advanced credit on the strength of the legacy.

to write plays and, after a considerable time, submitted three plays to the Abbey.

The Abbey is always looking out for new writers, and if it rejects a play there are three degrees of rejection. If the play is hopeless the author received a printed rejection slip. If the play is not good enough to produce but shows some skill in construction or dialog, the author receives a booklet of "Advice to Playwrights." But if the play shows exceptional promise but is nevertheless unacceptable the author receives a "reader's criticism" from Yeats or Lady Gregory. For his three plays Mr. O'Casey received "reader's criticism."

In the end, his play, *The Shadow of a Gunman*, dealing with slum life during the Black and Tan Days, was accepted, played, and eventually became a success, although on the first night—this was during the civil war—the box office took in only £13 of which the author's share was nine shillings and two pence. *The Shadow of a Gunman*, like the more brilliant *Juno and the Paycock*, is a piece of life cut clean and in the raw from the tenements. The people are O'Casey's neighbors. The conversations are true conversations. "I worked with Captain Boyle and Joxer (of *Juno*) for five years," he said. The tenement is crowded with life and character. A family of eleven are living in the next room! What appalls O'Casey is stupidity and ignorance. He sees the stupidity of the fighting between the factions, where the poor bear the brunt of the suffering. And he drives this home by his power of making us laugh one minute and cry the next. Who will forget the desperate cry of his own *Juno:*

"Ah, what can God do agin the stupidity of men!"

O'Casey knows the slum life from experience. He said with a queer sardonic gaiety, "Sure, I was so poor when I started writin' that the pen, paper and ink I used were stolen."

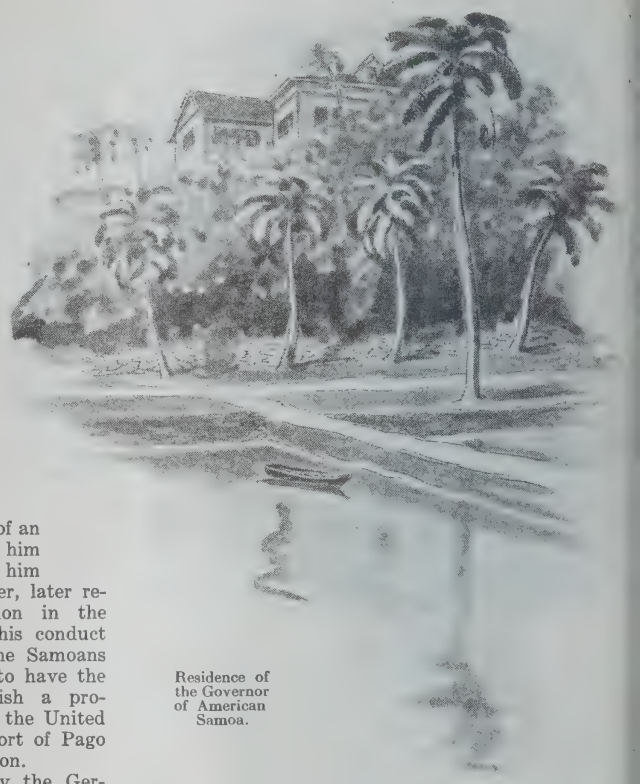
In his most recent Abbey production, *The Plough and the Stars*, O'Casey proves that, although he violates all the canons of dramatic law, he is sincere and stands alone among dramatists because he is himself alone.

Plays buzz in his head and he does not in the least want to write them. He refuses to go to London where he is being so lauded, and rather sweepingly condemns duchesses as empty people. But not a word against Lady Gregory, whose advice is always dinning in his ears, "Less theorizing and more characterization," for having won the power of the pen he is sometimes apt to forget he is an artist and not a preacher. To drive himself to work he has put a notice on his drab mantelpiece,

"Get on with the———play!"

The Abbey discovered him, made him possible. It is by no means a "radical" organization. At its twenty-first birthday performances there were represented all classes from titled notables, politicians and literary men, to the pit. Above all the pit, "which we love," as Lady Gregory said, "because we and they have had some little lovers' quarrels together."

Memories of *The Playboy* and *Blanco Posnet* uproars must have been passing through her mind!



The Abbey has become an institution, an indispensable institution, with all the other fine, kindly things which stand in the rain of "dear, dirty Dublin."

# Samoa—America's South Sea Paradise

(*Continued from page 8*)

Americans were represented even then. In 1872 Samoa sought to be placed under the protection of the United States, but Congress took no action. Colonel A. B. Steinberger, a special agent of the State Department, visited the islands in 1873 and made a report on them to Congress in 1874, later returning and setting up what amounted to a dictatorship.

His rule was good, it is said, but Congress repudiated him and after two years the captain of an English gunboat took him prisoner and deported him in an arbitrary manner, later resigning his commission in the English Navy when his conduct was investigated. The Samoans renewed their efforts to have the United States establish a protectorate and in 1878 the United States accepted the port of Pago Pago for a naval station.

Residence of the Governor of American Samoa.

Seizure of Apia by the Germans in 1885 and wars among the Samoans for the next few years aroused much bad feeling and the American squadron in Samoan waters was reënforced. There were gathered menacingly in Apia Harbor, on March 15, 1889, the American ships *Trenton*, flagship of Rear Admiral Kimberly, the *Vandalia* and *Nipsic;* the German ships *Olga, Adler* and *Eber;* and the British ship *Calliope.*

While three nations waited for news of warlike moves at Apia, nature took a hand in the game. Only the *Calliope* had steam up and was ready to put to sea when one of the South Seas' most terrific hurricanes descended upon Apia, whose harbor is an open roadstead. The *Calliope* put to sea in the teeth of the hurricane and by its great power and the seamanship of its officers, rode out the storm. Of the other six great warships nothing but wreckage remained. This disaster and its appalling loss of life caused the nations to drop war talk and conclude a settlement of Samoan matters.

But the strained relations among the American, British and German residents continued and different Samoan kings were backed by them, so that turmoil lasted for another ten years before a final settlement was made in which the three powers divided the islands among themselves. In 1900 the American flag was raised over all the islands lying east of longitude 171 degrees west of Greenwich, those still held by the United States. The others were divided by the British and Germans, but the latter dropped out of Samoan affairs when the World War started, and the British turned over to New Zealand the management of all Western Samoa.

The United States, in view of the fact that its naval station here was its main reason for being in the islands, placed them under the direction of the Navy Department and the latter outlined the system of government which has worked well thus far.

The commandment of the naval station is commissioned by the President as governor of the islands. He usually serves from eighteen to twenty-four months before being replaced. He has chief power and enacts regulations which have the force of laws. The secretary of native affairs is appointed by the Secretary of the Navy. Naval officers act as sheriff, island treasurer, customs officials, public health officer and public works officer. A board of auditors, composed of three naval officers and three native chiefs, makes monthly audits of all public accounts. The mayors (*pulenuu*) of the villages are native chiefs. All the foregoing comprise the executive division of the island government.

The judicial department consists of the secretary of native affairs, under direction of the governor, acting as chief justice of American Samoa, with control over all judicial matters. There are five native judicial districts, each with a native judge. Each village has its native magistrate. The decisions of native judges are reviewed by the chief justice before final decision obtains.

The legislative department, aside from the regulations ordered by the governor, consists of an annual *fono*, which is a legislature made up of the governor, secretary of native affairs, the high chief and ten delegates from each of the island districts. The *fono* meets every October, and while its deliberations usually are ended in four or five days, it may stay in session as long as it wishes and is allowed to take up any subject whatever, whether it calls for legislative action or not.

Land ownership in the islands is almost

ntirely native and natives are not permitted to sell to aliens, Americans included. There is a small amount of "freehold land," which may be sold to white men, and the naval station site, which is the property of the United States, but otherwise the Samoan still owns his islands and will continue to do so as long as the present system lasts. Also he manages his own affairs very largely, native customs and usage being taken into consideration in every matter that comes up for executive or final court decision.

Each of the island districts has its native governor and its county chiefs, named by the governor of the islands. The district governor is usually the high chief among the natives, and is called *Faatui*, "*faa*" meaning "like" and "*tui*" meaning "king" or "ruler." When a high chief dies, his family names his successor, usually a close relative, but not always. The Samoan family frequently adopts men, women and children into it, and its system seems intricate to the outsider.

Besides the high chiefs there are the "talking chiefs" and the plain chiefs. Talking chiefs are men of ability and represent the high chiefs in all matters requiring diplomacy. In olden days it was the high talking chief who declared war, and in many ways his position was more important than that of his nominal superior.

## Court Without a Sheriff

(*Concluded from page 4*)

most widely discussed advisory opinion of the court was that attending the Eastern Carelian case. Finland and Russia, being at war, concluded a treaty which left Eastern Carelia, on the Russo-Finnish border, in the possession of Russia. At the time of the treaty Russia made a declaration of intention to give certain rights to the Carelians, which she subsequently failed to grant. Finland protested and proposed submission of the question to the World Court. Russia declined to agree to the move. Because Russia, as one of the interested parties, and not a member of the League of Nations, refused to take any part in a court examination of the issue, the court declined to give an opinion on the controversy.

The Mosul Case, concerning Irak, a territory under British mandate, also aroused wide interest. This was the final decision of the court before its recent adjournment. At the Lausanne Conference Turkey had agreed to let the council of the League of Nations inquire into the dispute between Great Britain and Turkey over the ownership of the province of Mosul.

At the instance of Great Britain, the Council of the League, against the protest of Turkey, asked the World Court to give an advisory opinion. The court advised that the council had power to make a decision binding on both parties; that the decision should fix permanently the boundary between Turkey and Irak; and that the parties to the dispute were to take part in the vote in the council but their votes were not to be counted in determining whether or not the decision was unanimous. Acting under this authorization, the council awarded most of the province to Irak, in accordance with Great Britain's contention.

Thus runs the decisions of the Permanent Court of International Justice. Whether or not they have averted wars no one can say with assurance.

There is no sheriff to compel antagonistic neighbors to submit their differences to a court, or to enforce its peace-seeking decisions when rendered.

# The Sun Dance of the Blackfeet

## An Ancient Custom That Is Doomed to Extinction

By ROBERT MOULTON

TODAY the Blackfeet Indians have their own homes and farms like the white men. But among the older generation there still exists the desire to revive on occasion some of the ancient customs of the tribe. So it comes about that each year they leave the homes on their reservation in Southern Alberta, and arraying themselves in all the picturesque gaudiness of beads, buckskin and blankets, congregate at some suitable point and observe their chief religious ceremony, the Sun Dance.

Originally only the sun worshipers took part in this festival, but for many years past Indians of all creeds have attended and participated in the rites. There is no doubt, however, that these ancient customs will soon be a thing of the past, for the new generation of Indians is learning the habits and religion of the white man; he attends their schools, plays their games, and follows their occupations. The modern Indian is studying to become a doctor rather than a medicine man.

To the visitor who is privileged to attend one of the Sun-Dance camps it is like entering another world. Imagine a circle of weirdly painted tepees crowded with Indian men dressed in all their native splendor—with possibly the addition of a top hat—and groups of blanket-huddled squaws and red-brown youngsters. All night long the tom-toms throb out their message, recalling the days when the red man was master and his white brother an unwelcome interloper.

The convocation of a Sun Dance can be made only by a married woman whose life has been above all reproach. Should one of her relatives become dangerously ill, this woman may make a vow that if her gods will cure the sufferer she will sponsor a Sun Dance. If the sick person recovers it is presumed that the gods have heard her prayer and at a suitable place and time the camp is established. In the event of no woman making such a vow, a woman who has previously sponsored a dance is asked to officiate. This woman thereupon becomes the leader of the dance and commences a fast.

At noon on the fifth day of her fast this woman proceeds with the usual accompaniment of tom-toms and chants to a shelter which is open in front and faces the sun lodge from the west. Here she seats herself, with the sun priest and women who have previously conducted similar dances. A striking point of many of the rites that follow is their similarity to ceremonies of the Christian and Jewish faiths.

First of all, offerings to the Sun God are brought to the medicine man and blessed. These usually take the form of feather fans, headdresses or blankets and clothing for the use of the destitute. As these offerings are given, the donor kneels in front of the medicine man, who paints a circle of brown paint around his face and wrists, at the same time keeping up a continuous chant. After each has been painted, all sit in a circle around the open side of the shelter, where they are joined by the remainder of the tribe. Here a feast is given in which all take part with the exception of the leader, whose term of fasting is not yet completed.

While all the tribe are thus gathered together, announcements of general interest are made. Thus if someone wishes to change his name, everyone learns that Chief Smiling Face will hereafter be known as Chief Yellow Toe. Though not in any way connected with the Sun Dance, there is also an official announcer in camp whose duty it is to walk through the lines every few hours crying out any item of news among the tribe. He is the Indians' newspaper.

The lodge is the largest building in camp, having a diameter of about thirty feet. Five groups of six men each now place themselves around the circle, each one carrying a long pole, tied (in pairs) to the one next to it. To the accompaniment of more singing these groups gradually converge until they are close to the sun lodge. The entrance of this circle always faces the rising sun. The medicine man then ties the offerings previously given him, with great secrecy, to the head of the center or Sun-Dance pole which is on the ground ready to be put in position.

When the offerings are securely tied on, a shot is fired, denoting that the leader's fast is at an end. The men circling the framework of the lodge then raise the center pole, fixing it in position with the poles they carry.

The whole ceremony of the Sun Dance concludes with the dance itself. The dance is not a dance such as we understand it, but is more or less of a social gathering. After the usual prayers and speeches, each of the old men in turn tells stories of his youth. These generally describe a battle with another tribe, or a big buffalo hunt. After finishing his description, the Indian reacts the scene as closely as possible.

Upper left—The procession to the sun ring—medicine man leading, women following.
Upper right—This member of the Sun Dance lodge is depicting an old custom known as "brave making."
Center—Medicine man in front of his tepee.
Lower right—Interior of Medicine Pipe Tepee. The components of the pipe are set out on a pile of blankets.

# Folk of Foreign Lands and Their Marriage Customs

HAPPY bridal couple of Schwalm, Hessen, Germany. Natives of this region cling to their old folk costumes.

THESE Indian natives are leading a rich Hindu bride to the wedding ceremony. She wears a heavy veil which completely hides her face.

Oval—
BRIDAL party in boats on way to visit the bride's village, in Sumatra. This will be her last chance to shine socially before she begins work for her husband, who may have other wives, too.

URBANA ILL

DEMOCRACY is still upon trial. The civic genius of our people is its only bulwark, and neither laws nor monuments, neither battleships, nor public libraries, nor great newspapers, nor booming stocks; neither mechanical invention, nor political adroitness, nor churches, nor universities, nor civil service examinations can save us from degeneration if the inner mystery is lost. That mystery, at once the secret and the glory of the English-speaking race, consists in nothing but two common habits, two inveterate habits carried into public life—habits so homely that they lend themselves to no rhetorical expression, yet habits more precious, perhaps, than any that the human race has gained. They can never be too often pointed out or praised. One of them is the habit of trained and disciplined good temper toward the opposite party when it fairly wins its innings. . . . The other is that of fierce and merciless resentment toward every man or set of men who break the public peace.

CHRONICLER OF THE NEGLECTED TRUTH

# Why Women Buy Tires

Woman's concern about her family's safety, and the wise expenditure of money, has naturally led her to take a deep interest in tire buying. This has resulted in a wider appreciation of what Firestone engineers have done to provide the safest, most economical tire equipment for all cars, and has proved one of the big factors in making Gum-Dipped Cords popular.

In both high pressure and Balloon Cords, Firestone provides every benefit which fine materials and thorough designing can make possible—plus the extra strength, dependability and mileage of the special Gum-Dipping process. The Firestone Non-Skid tread grips securely when it is dangerously slippery under foot. The deep, tough gripping edges take hold — giving instant response to the brakes.

When your car is shod with Firestone Tires you enjoy confidence and a sense of security, whether or not you are at the wheel. The Firestone reputation for reliability insures you this safety, as well as the economy of greater mileage for the money. The Firestone dealer in your locality offers helpful advice and service, as well as the best tire values in town.

# THE ESSENCE OF THIS ISSUE

'The time I spoke my graduation piece'—that is the cover theme this week. No day quite ranks in memory with graduation day. The old town hall, or the church on the village square: white dresses: home-grown flowers: flushed faces: no robed procession of academic dignitaries on historic campus ever approaches that first accolade of learning. If hope for the future runs low, date yourself to attend a few country and city graduation exercises this June: it will brace you.

Mr. Ford's Page this week takes a very unusual slant on war debts. It would be a good thing if all war-makers lost their credit.

The Liberty Bond scandal *has not* been cleared up. President Harding ordered the mystery of duplicate bonds investigated. His investigator, C. B. Brewer, was shadowed by Secret Service men! The President ordered important records preserved. They were destroyed. He said Brewer was not to be interfered with. After Harding's death Brewer was discharged —*at the request of Secretary Mellon.* (p. 3)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

Success doesn't come in little packets like pink pills. Inspiration is not sold by the yard. Yet many people are persuaded by alluring advertisements that if they listen to a lecture or subscribe to a mail order series they will without further effort acquire happiness and power and personality and wealth—especially wealth. Here is a story about these hopeful, genial dupes, done in Tom Masson's best style. (p. 7)

Speaking of personality reminds me that streets have it as well as men. Take State Street, for example. State Street is as characteristic of Boston as cod or baked beans. In fact, it *is* Boston. It is sedate and venerable and—rare quality these days!—delightfully prim. One of the pleasures of Boston is a stroll on State Street. May Whiting introduces us to this old thoroughfare in her usual interesting manner. (p. 8)

Nobody likes articles or stories that are 'continued on page——' Even the editors don't. But there's no other way of good make-up in certain publications. The worst of it is that the real gist of the article is usually in the last 'jump.' I never boost an article in this page until I have read through the last 'jump.' Then I *know* whether it is good or not.

China, some one once remarked, goes from everlasting unto everlasting. So it seems. Its civilization began in the mists of the past whereof our records are lost. The centuries have marched by in unhasting, unresting procession; dynasties have risen and fallen and passed into oblivion, and still China goes on its imperturbable way. It is this very sense of *everlastingness* that propels China onward. (p. 6)

*Were $100,000,000 of Liberty Bonds cashed twice?* The public has a right to know. (p. 3)

Our readers are now asking for this or that choice old American dance. We are meeting these requests in the selections made on our dance page. This week there are two, a Plain Quadrille and a Novelty Two Step. Some persons who know good dances asked for them. How fascinating these Old American dances are! (p. 32)

Newport's 'golden age' has degenerated to the 'gilded age,' but traces of the earlier and better remain. There are the Redwood Library, oldest in the country, Trinity Church, with the crown and pennant still on the steeple, the Nichols House, once a tavern. And then, of course, there is Cliff Walk, where fishermen can, and do, gaze at financiers. (p. 14)

There are many interesting stories in this issue that can't possibly be given separate mention here. Just read them all. You will not, of course, overlook the installment of Charles Finger's absorbing story on Magellan. This time he tells of the part played by business men, while the nobles stole the glory. (p. 16)

And you will want to read William Moore Patch's article on Poland. Interesting news is coming from Poland these days; it is a rich country and various forces are contending for it. And, for sport flavor, we have a story on Polo, that liveliest of sports. Another story on Annapolis, where our future admirals are made, and another on Clovernook, homestead of the Cary sisters, whose poems you read years ago in schoolbooks.

There's an editorial in this issue which you should read, if you wish to know the truth about Muscle Shoals. It is beyond belief to what extremes of unpatriotic scheming some monied interests in this country can go. This magazine stands for Muscle Shoals as an important part of our national defense and as a source of fertilizer for the American farm. And when we see influences almost succeeding in defeating both these purposes, we intend to speak out. We are beginning to speak out in this issue. If more is required, more will be given.

# Scandal Never Was Cleared Up!

## Why President Harding's Investigator Was Hindered at Every Turn in $100,000,000 Liberty Bond Mystery

By PAUL PERRINGTON

AN ARTICLE in THE DEARBORN INDEPENDENT of August 22, 1925, cited charges made by a committee of Congress which were so remarkable that in former times—before we had been saturated with Daugherty, Fall, Doheny, and the like—Congress would probably have been reconvened in extraordinary session to purge the Government. Only a portion of the committee's findings were chronicled; enough, however, to show that the Government had sustained heavy indefinite losses through a gigantic gambling scheme in Government-owned Liberty Bonds, and one *definite* loss of $28,000,000 by clipping and cashing coupons from bonds which the Government had rebought and redeemed. Other *definite* losses swelled the amount of *known* losses to $110,000,000. The committee sought authority to recover these losses and to ascertain the amount of the unknown losses and to recover them also. The steam roller prevented Congress from seeing the report.

Suppose your board of directors reported:

1. Your checks have been fraudulently duplicated.

2. Your treasurer said it was error, but his answers were evasive.

3. Your bookkeeper had doctored his books.

4. The other officers knew it and did not care.

5. They knew you had a fat bank account and said in effect: 'The deuce with the law.'

6. They then destroyed your stubs overnight.

7. When, too, your by-laws said preserve them and you had personally warned your force to keep them—that you suspected something was wrong.

8. That auditing accounts from branch houses, by which the fraud has been disclosed, had been abandoned—that keeping accounts had been declared, by the treasurer, 'useless expense.'

9. That instructions had been ignored in the purchasing branch.

10. That this branch was using questionable methods.

11. That these methods were costing you substantial losses.

12. That the amount of your losses could not be found on the last night of the month, due to failure of records to agree.

In the circumstances *do you think your employes could induce you to forbid further examination of accounts simply because it was the end of the month?*

Before you permit your mind to answer the question, read the words in the photographic reproduction of the committee's summary of their report. And as you read, remember that the bonds *are* yours. That the treasurer *is* yours. That the bookkeeper *is* yours. That the law that was ignored is *your* law. That the destroyed stubs were *your* stubs. That the Congress whose will was overridden is *your* Congress. That the losses incurred were *your* losses. That the 'leaders' who smothered the inquiry, the Secretary of the Treasury who advised it and the President who permitted it are your *servants*, not your *masters*. When you reach that point it might be well to make a beginning on the letter to your Congressman to remind him that 'masters' went out of business in 1776.

The evidence discloses:

1. That there has been duplication of bonds, some fraudulent, the proportion not yet determined;

2. That the report of the Treasury relative thereto is incomplete, contradictory, and evasive, and the testimony it offered to show innocent error was refuted;

3. That records have been falsified, the extent of which is unknown to the committee;

4. That indifference to duplications has been prevalent;

5. That legal remedies have been neglected in the payment of duplicates;

6. That destruction of bonds was conducted in haste and that destruction records are not dependable;

7. That the bonds were destroyed in violation of law, of regulations, and of presidential order and evidence of duplication thus removed;

8. That under a theory of economy evidence not destroyed has been rendered useless and the Government also thus deprived of its main safeguard against future fraud;

9. That the will of Congress has been overridden in the repurchase and sale of millions of dollars' worth of bonds;

10. That questionable methods were employed in handling these funds;

11. That substantial, actual losses to the Government have resulted; and

12. That the extent of these losses has been rendered uncertain by failure of records to agree.

(From Report No. 1635, 68th Congress, 2nd Session. Also reproduced in full in *Congressional Record* of March, 1925, in speech of Congressmen King, of Illinois, and Steagall, of Alabama.)

FEDERAL RESERVE BOARD
WASHINGTON

July 20, 1923.

To the Governors
of the Federal Reserve Banks.

Gentlemen:

This will introduce Mr. Charles B. Brewer, one of the Special Assistants to the Attorney General, who is making some investigations by order of the President, as you will note from a letter under date of June 30, 1922.

This is to advise you that to my knowledge the President is very much interested in having the investigation made by Mr. Brewer, and he will appreciate, I am sure, any help you may be able to give him to bring light upon the matters which he is investigating.

Respectfully,

Governor.

Governor of Federal Reserve System knows that President is interested.

I. THE PRESIDENT STARTS MR. BREWER ON THE QUEST.

THE WHITE HOUSE
WASHINGTON,

January 4, 1925.

My dear Mr. Brewer:

I am enclosing you herewith a request which I have from the Attorney General for service at your hands. I am very much disposed to oblige the Attorney General in this matter. He has come to have a high regard for your services and he feels that you can be of very great assistance in a matter of deep concern to the Department of Justice. I trust this request will find you so situated that you can give him the service requested without serious interference with the important work you have in hand. I suggest that you report to General Daugherty personally.

Very truly yours,

Mr. Charles B. Brewer,
Department of Justice,
Washington, D.C.

II. THE PRESIDENT GIVES GENERAL AUTHORITY TO COLLECT INFORMATION.

WASHINGTON

June 30, 1922.

My dear Mr. Brewer:

It is well understood throughout the Treasury Department and by Secretary Mellon that you are to be permitted to secure all information you desire in making the investigations which have been committed to you. The presentation of this letter to any concern dealing with the government or with the Department will undoubtedly make available to you all necessary opportunity for investigation. If these credentials are not ample please report to me the specific case and a special order will be issued.

Very truly yours,

Mr. Chas. B. Brewer,
Special Assistant to the Attorney General,
Washington, D.C.

III. THE ORDER TO TRAVEL.

INITIALS AND NUMBER CBB.

DEPARTMENT OF JUSTICE
WASHINGTON, D. C.

September 6, 1922.

Chas. B. Brewer,
Special Assistant to the
Attorney General,
Washington, D.C.

Sir:

Proceed to various cities of the Federal Reserve Bank System and surrounding towns as necessary in connection with the investigation of matters verbally discussed.

You will be reimbursed for travel and subsistence expense in accordance with Departmental regulations.

Respectfully,

Assistant Attorney General.

An ardent admirer of the present Secretary of the Treasury recited to the writer the details of a board meeting of one of the companies in which the Secretary was a director before he assumed his present duties. 'It was a complicated affair,' said my informant, 'and there was much talk from various parts of the table. Finally "Andy" (meaning Andrew W. Mellon) spoke right to the point. Said he, "Oh! Ho! Somebody has been stealing." Real action soon followed.'

But no such action which hurt anyone's feelings followed Mr. Mellon's visit to the rooms of the Banking and Currency Committee last February, where he was shown indisputable proofs of deceptive reports to Congress made by the Treasury Department and signed by himself; where he was shown photographs of original *instructions* from heads of the Engraving Bureau to subordinates to falsify records and get credit for the destruction of securities which had disappeared; and photographs of other records showing *they did this very thing;* where he was shown photographs of a certification on Treasury books signed by the head of the destruction committee that millions of dollars' worth of securities had been destroyed in May, 1918, of which the committee then held in safe deposit vaults some $500,000 worth of these very securities described in detail by issue and individual numbers which the records had been made to show as having been destroyed years before. These securities are supposed to be in existence today. They were in the safe deposit boxes at Riggs National Bank on March 4, 1925, when the committee went out of existence and turned them into custody of Hon. Tyler Page, clerk of House of Representatives 'for delivery to the "next" Congress.'

Mr. Mellon must have used softer methods than the above anecdote describes him as using in private business. Other matters tend to show it. For example: In the *Congressional Record* of March 3, 1925, in a speech of Congressman Steagall, of Alabama, in which he was illustrating that 'there were quite a number of specific and serious charges which had been made by Mr. Brewer, attorney for the Department of Justice, which the Secretary of the Treasury had not answered,' he gave numerous examples which would seem to merit the attention of one looking for 'real action.' Mr. Steagall continued:

It was charged:

That Benjamin R. Stickney, one of the 28 discharged employees of the Bureau of Engraving and Printing had, as a principal with Ralph, the former director, in a bribe of $8,000 to a representative of the Mexican Government, in a patent scheme exploited the facilities of the Bureau for their joint private gain, which came to light in a suit between the parties and was evidenced by a memorandum signed by Chief Justice McCoy of the Supreme Court of the District of Columbia. Stickney was reinstated and is still employed at the Bureau of Engraving and Printing.

The report of the Secretary of the Treasury made no reference to this.

It was charged:

That James E. Chamberlain, another one of the 28 discharged employees made unrestricted use of the Bureau of Engraving and Printing as a salesroom for farm products, hauled from Virginia in Government machines; that he had been arrested for having a still on his premises made partly of Government material; of hauling the corn for making the liquor in Government machines; of taking from Government storehouses, without pay, other ingredients for making liquor; and of appropriating Government tires and various material for his private car—for none of which offenses Chamberlain was placed on trial, though the matters were duly brought to the attention of the District Attorney and that *Chamberlain was* subsequently *reinstated and is now employed at the Bureau of Engraving and Printing.*

*The report of the Secretary of the Treasury made no reference to this charge.*

It was charged:

That Thomas W. Goss, an employe of 37 years' service, had, on March 9, 1921, written a long letter to the Secretary of the Treasury detailing various charges against James E. Cham-

berlain, referred to above, and making other serious charges involving the integrity of the Bureau of Engraving and Printing, and that while Chamberlain had been reinstated, Goss had never received an answer to his letter, but had been demoted about $1,000 a year in his salary and transferred to a minor position in another division.

*The report of the Secretary of the Treasury made no reference to this.*

It was charged:

That various cases of vice and dishonesty reported to Mr. Wilmoth would be protected by packed committees; that G. A. Cole, J. Benjamin and Adam Ruth, 3 of the 28 employees, had been utilized on such committees; and that the 3 men had been reinstated at the Bureau of Engraving and Printing.

*The report of the Secretary of the Treasury made no reference to this.*

It was charged:

That uncanceled bonds which should have been canceled were received in great numbers, some 2,500 to the value of several million dollars, within a period of three months; that at least one clerk who had reported to her superiors that uncanceled bonds were passing over her desk had been reprimanded by them and by the Secret Service for so reporting.

*The report of the Secretary of the Treasury made no reference to this charge.*

The point to be made will be reverted to. We will let Mr. Steagall continue. He added: "The truth about the discharged employees of the Bureau of Engraving and Printing should have been made known by the officials of the Treasury Department in justice to the late President Harding, if for no other purpose. I am sure no thoughtful citizen could for a moment countenance the criticism that President Harding, with his conservative temperament and kindly heart, could have been induced to issue the order summarily dismissing employees of the Bureau of Engraving and Printing without full justification of his action.

The examination of the report of the Secretary of the Treasury shows that other charges which have been made were ignored or evasively answered or that an attempt was made to dispose of them by such statements as:

'Mr. Brewer's charges are utterly false in every respect.

'Primarily Mr. Brewer has not been interested in the truth!

'Just here let me emphasize the fact that the findings of the Committee set forth in the report submitted to the House are based entirely and exclusively upon the testimony of officials and employees of the Treasury Department, and official documents and records, and not upon the testimony of Mr. Brewer, the Attorney for the Department of Justice, though it is only fair to say that the Committee has the utmost faith in the character and ability of Mr. Brewer. In this connection I wish to say that the Committee found Mr. Brewer, the Attorney for the Department of Justice, to be a man of great industry, remarkable ability, scrupulously truthful, and his services were of inestimable value.'

Here indeed is a truly remarkable condition. If one of these men was guilty of bribery, another was a bootlegger and a thief and the rest guilty of packing 'committees' in order to suppress information about misdeeds, about the last place to employ them would seem to be in the money-making plant of the people. If they were not guilty, why did not Mr. Mellon say they were not? Why in any case stop the committee which was seeking to find out?

Again, if the demotion suffered by Mr. Goss and his transfer to a minor position in another division was for reasons other than that he had misguided notions about employes reporting abuses, it need have taken but small space in the 200-page defense of the Treasury to have said so. There was a complete silence as reported by Congressman Steagall—just as there was regarding the case of the clerk who was reprimanded by both her superior officers and the Secret Service.

For doing what? The charge is that this clerk thought it dangerous for millions of dollars of negotiable instruments, supposed to have been canceled, to be treated with no more safeguards than ordinary matter when the regulations regarding cancellation were most stringent.

And why the Secret Service? It will probably be news to the general public that Secret (Concluded on page 27)

## IV. SHOWING THE IMPORTANCE OF THE JOURNEYS.

ADDRESS REPLY TO "THE ATTORNEY GENERAL" AND REFER TO INITIALS AND NUMBER

DEPARTMENT OF JUSTICE
WASHINGTON, D. C.

JDH-REH

October 26, 1922.

C. B. Brewer, Esq.,
Special Assistant to the Attorney General,
Department of Justice.

Sir:

You are hereby advised that, inasmuch as you will be required to carry securities of considerable value when making official travel in connection with the investigation and prosecution of alleged liberty bond frauds, on which you are now engaged, you will be authorized to make such travel in drawing room when necessary. In this connection it is understood that a representative of the Treasury Department will accompany and occupy the drawing room jointly with you and will furnish the extra or additional ticket necessary to travel in a drawing room.

Respectfully,

For the Attorney General,

Assistant Attorney General.

## V. THE PRESIDENT WAS ANXIOUS TO DO THE RIGHT THING.

THE WHITE HOUSE
WASHINGTON

May 8, 1923.

My dear Mr. Brewer:

The matter of the destruction of accumulated cancelled securities and coupons has been brought to my attention by both the Secretary of the Treasury and the Register of the Treasury. We are getting to a point where we must either proceed with the destruction of cancelled securities or engage special storage room for them. I have instructed the Secretary of the Treasury to proceed with an order to destroy the cancelled War Savings Securities as a means of temporary relief. If you have reason to believe that we ought to proceed with the destruction of other vast accumulations I will be glad to have you advise me concerning the matter.

Very truly yours,

Mr. Charles B. Brewer,
Department of Justice,
Washington, D.C.

## VI. WHERE THE SECRET SERVICE GOT INTO THE PICTURE.

WM J. BURNS.
DIRECTOR.

Department of Justice,
Bureau of Investigation,
Washington, D. C.

WJB:JBD

September 7, 1922

TO ALL AGENTS IN CHARGE AND SPECIAL AGENTS OF THE BUREAU OF INVESTIGATION, DEPARTMENT OF JUSTICE:

This letter will be presented by Special Assistant to the Attorney General, Charles B. Brewer, and should he call on any of the Agents in Charge or special agents at any time, you are instructed to aid him in every way possible and comply with his request, and to treat any matters submitted by him in the strictest confidence.

Mr. Brewer's signature is below, and he can be identified by it.

Yours very truly,

Signature:

Director

# In the Land of the Everlasting

## The Cause of the Everlastingness of the Chinese Is Consciousness of Eternity

By JAMES H. LEWIS

DOWN in the city of Foochow, 400 miles south of Shanghai, during the violent opposition to the twenty-one demands of Japan in 1915, there was formed a society with the engaging title, 'Kill-one-Society.'

The avowed and single purpose of this organization was to enroll a sufficient number of Chinese, each of whom would be willing to stake his life against that of an individual Japanese in death. 'A sufficient number' would be approximately 71,000,000, as that was the approximate population of Japan. The stunning idea behind this organization was that Japan was doing something to China which should not be done. There was an effective way of preventing it; to kill all the Japanese. There are about 450,000,000 Chinese. If, therefore, each Chinese and Japanese engaged in deadly combat would kill each other, all of Japan would be depopulated, but there would still be 320,000,000 left in China—plenty to carry on the business of the nation. The success of the society was simply a matter of arithmetic.

*Perhaps the Cradle of the Human Race*

Roy Chapman Andrews has spent quite a number of years in exploring Mongolia and is still engaged in that task. He believes that that area was perhaps the cradle of the human race, rather than the Valley of the Tigris and the Euphrates; and although many interesting relics are just now being discovered in the former habitat of the Sumerians, Andrews has found more dinosaur eggs and mastodon skeletons and indications of ancient life than have been found in Asia Minor.

When Abraham went out from Ur to pasture his flocks on the Plains of Hebron, the Chinese were dressed in silks and living in well-regulated cities. When Socrates, Demosthenes, Democritus and Plato were the great leaders of Grecian culture, the Chinese had been teaching the learning of their sages for centuries. When Rome succeeded Greece and conquered the Western World, the Chinese retained their culture and continued 'to multiply upon the earth.'

China used to be called an empire. About the only reason for calling it an empire was the fact that it had an emperor. The Chinese Empire was different from any other empire, except Japan, in that it was an empire of homogeneous people. They were of one race, one color, and fundamentally of one language. The empires of Egypt, Greece, Rome, France, Austria, Russia, Germany, England, all contained diverse populations, often with utterly contradictory ideas and ideals. Indeed in most empires one part at least of the empire existed not for itself so much as for the benefit of another and exploiting part.

Why is it that China has so long endured? Why does she not break up today? The primary cause of the everlastingness of the Chinese is their consciousness of eternity. China has never been permanently conquered. China has always swallowed her conquerors.

Genghis Khan came out of Mongolia with his mighty armies of Tartar horsemen and with the exception of India conquered the entire Eurasian continent from the Pacific on the east to Vienna on the west. He and his son rebuilt Peking and his dynasty ruled China from A. D. 1259-1368. But when his dynasty was succeeded by the Mings, the Mongols became subservient to the Chinese, and Mongolia today is largely a settlement ground for the ever encroaching Chinese.

The Manchus swept down over the Great Wall in 1643, put the pigtail on the Chinese head and ruled dramatically until 1911. When the Manchu dynasty ended, this people also had almost entirely lost its identity and become swallowed up by the Chinese mass.

The Chinese are gradually pushing up into Siberia, where they not only compete with the Russians, but outwork and out-trade the Russians in the 'coldest region on earth.'

For more than a quarter of a century the Chinese have been going down into the Federated Malay States, Java, Sumatra and Borneo, have intermarried and settled, and have become the business men, as well as the real laborers, among those millions of square miles of fertile land under the equator, and there they will remain.

*They Have the Very Rare Ability to Wait*

'Up and down the China coast' has been a romantic phrase of the West for many years. Today that coast extends beyond the simple boundaries of the Old Empire of China and stretches from three degrees below the equator on the south to the Amur River on the north. The eastern face of Asia is Chinese. The future of Eastern Asia and the Western Pacific will also be Chinese.

We are not going to debate here as to the relative military leadership of the Western Pacific. Japan is predominant today, but in the long run population is what counts. Science, general education, modern industry, all have their weight for a time, but these gradually become the common possession of all, and finally the balance of power swings back to the physical majority.

The preservative and irritant of the Chinese is their patience. Like all Eastern peoples they have the rare ability to wait. That is the cause of their slowness in scientific development. It is one of the causes of their progress. If an end is sought it becomes the ambition of the clan. When will this end be achieved? It may be next year, or in the next generation—it is all the same.

*Not Disturbed by the Civil War*

We in the West are greatly disturbed over the continued civil war in China since the death of Yuan Shi Kai. Are the Chinese disturbed? Not particularly. Of course they regret it and there is suffering for which they are sorry, but eventually—*eventually*, one side will win, and then there will be peace. If the warfare is not fought out completely, perhaps it will spring up again. But if it is fought to a finish now, then peace ought to be much longer.

To us in the West, this spectacle of nearly ten years of war, together with consequent loss of life and squandered levies for armies and munitions, seems almost beyond belief. But while our own Civil War was draining our resources from 1860 to 1865, the Chinese were just finishing up fifteen years of continual fighting in the Taiping rebellion, with a total loss of life estimated at between thirty and fifty million people!

In recent years in America we have come to speak so easily of millions of dollars that we are gradually getting an idea of how much a million dollars is. In thinking of China, one simply translates that idea into human beings. For example, the province of Chihli, in which Peking is located, is about the size of Ohio, but its population is equal to that of the following states combined: Kentucky, Indiana, Michigan, Wisconsin, Illinois, Missouri, Iowa, Minnesota, North Dakota, South Dakota, Nebraska and Kansas.

The western province of Szechwan alone has a population equal to that of the entire United States west of Pittsburgh.

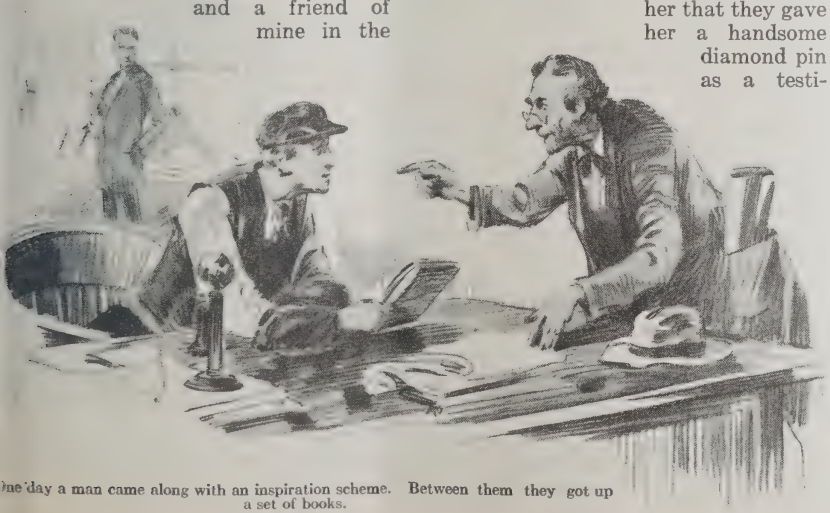
But you say that this great mass, though possessing homogeneous qualities, lacks cohesion (Concluded on page 23)

# "Are You an Optimist?"

## If You Are You Will Not Wait for Outside Inspiration, But Find an Idea for Yourself and Follow It Up

By THOMAS L. MASSON

ILLUSTRATED BY J. C. GRAHAM



FIRST let me tell an incident from the inside. I know of a young man who for many years grubbed along as a clerk in a publishing house on a small salary. He gradually learned how to write circulars, the follow-up system, and so on. One day another man he knew came along with an inspiration scheme. He had gathered together a mass of uplift material, a kind of mixture of Christian Science, New Thought, Character Building and other stuff. Between them they got up a set of books. Then, just as they were ready to launch this set, their money gave out. They went to another man who had money. Although I don't know the financial details, it is fair to assume that this man grabbed a majority of the stock. The sets cost them about seventy-five cents each. They sold for eight dollars, payable in installments. In telling me about this, a publisher said to me that he wouldn't dare say how much they had made, but it was well over $100,000.

Not long ago I received a circular from a concern in the Middle West. It was printed on pink paper and it offered me the key to the universe for a comparatively small sum. There wasn't anything that circular didn't say I could have, and all by just taking their course. On the back page were testimonials from all sorts of people, telling what grand results had been achieved for them: health and wealth, harmony and happiness, and all by just turning a master key which opened all the power there is. Anyone could get a master key.

Well, I sent this circular to the Postmaster-General in Washington to get his opinion on it, and a friend of mine in the post office wrote back from there telling me all about it. The gist of it is that these uplift people all keep within the law. They know just how far they dare go in their quest of suckers. In short, it is strictly up to the men or women who get these master invitations to use their own intelligence.

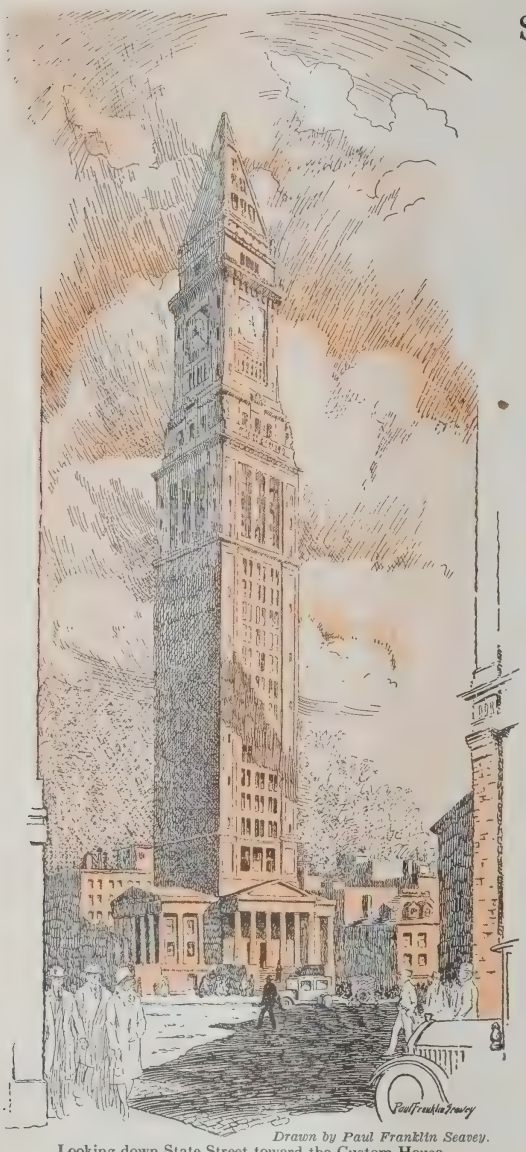
I am writing this not to make an attack on any particular system of either new or old thought, but simply to put it up to my readers, in the light of a few facts, to use their intelligence to combat what I believe to be a serious condition. It is by no means the people of the lowest intelligence who allow themselves to be victimized by inspirational sharks. On the contrary, some people of the highest intelligence seem to be the most gullible.

Not far from where I live is a city of twenty thousand inhabitants. A few years ago a woman came to this town, widely advertised in advance as a psychologist, a reader of character, a dealer in happiness. She had a very attractive personality. She began first with a lecture and then started a series of lessons, by the group system. She remained in this town less than a month, carried away ten thousand dollars—so I am credibly informed by those who made as close a calculation as possible—and when she left, the women of the place were so crazy about her that they gave her a handsome diamond pin as a testimonial. I know the people in this town fairly well and since then things have moved along about the same. I don't suppose that the aggregate of happiness has gone up even one-half of one per cent. How could it? If happiness could be manufactured in plants and dealt out in tin cans, there would be no occasion for advertising it.

One day a man came along with an inspiration scheme. Between them they got up a set of books.

The first thing to be noted about all this literature is that it deals almost exclusively with money. While they offer you personal charm, harmony, health and power, all of these things are merely thrown in as good measure after you have achieved that magic thing *success*, and success means dollars and cents. Now during the course of my life I have known personally a number of these success manufacturers. They were all poor, and one man in particular, whose books sold in the millions, was always hard up and—as one of his associates put it to me—'worried stiff most of the time.'

The second thing to be noted is that—and this is a very curious fact—all of them are sincere. The man I refer to—who was always hard up in private—was one of the gentlest and most lovable men I ever met. He once said to me: 'I don't see how you possibly get through with the work you do.' I smiled and replied: 'Why, don't I know you?' He appreciated the joke and laughed; yet he firmly believed that his 'message' was a true one! And who shall say that it was not? Each one of us has a set of ideals. We believe in them, live them in our minds, and if we do not actually achieve them in our practical lives, is this a case against us?



I size up most of these inspirational people just as I feel toward some Congressmen—they have tried everything else and this is the only thing left for them to do. Not being able to make money for themselves, they dream of making it for others.

Here is a man who sends me his photograph—the picture of a pasty-faced, middle-aged, somewhat cherubic individual, with an extremely fatuous expression. Now this genial bore writes and tells me that if I will subscribe to his treatment, he (Continued on page 22)

# Old Boston's Historic Highway

## State Street Saw Some of the Most Stirring Events of Revolutionary Days

By MAY B. WHITING

*Drawn by Paul Franklin Seavey.*
Looking down State Street toward the Custom House.

WE ARE not too young a country to have famous highways. There is Fifth Avenue, with its changing lure, waiting, impenetrable, for an interpreter, and there is the Lincoln Highway and the path from Concord to Walden. And then there is State Street in Boston, not very wide, nor very straight, nor very long, but bearing the marks of distinction that come from having a history all its own.

When it first began its career it wasn't a street at all, but 'the townsway down upon the flats.' Then it was 'market street' or 'water street,' for it led from the shore into the center of the town and at the lower end Long Wharf continued into the water. After a while it became King Street, and at the close of the Revolution it received the name of State. Mr. Wilson, pastor of First Church, lived here, and his land extended to the water's edge with little coves making up in where the fishermen sometimes dumped their refuse, to his great annoyance. Near his home was the meetinghouse, a box-like structure with a thatched roof, where service was announced by beat of drum.

It must have seemed rude indeed to Mr. Wilson, who was born in Windsor Castle and had been brought up in royal favor. Instead of worshiping in the dim arches of a cathedral, we see him trudging a two days' journey into the wilderness with Mr. Eliot to pray among the Indians, or, with his lantern, making his way through the tortuous lanes at night to visit the sick when smallpox devastated the settlement. Three times his own home was destroyed by fire, and he rebuilt on the same spot. Once a messenger went out to meet him as he returned from a journey.

'I have sorry news for you,' he said. 'Your house has burned down.'

'That is because God intends to give me a better one,' he replied quietly.

Mr. Wilson's windows looked out on the market place, and Crooked Lane ran through his orchard. Here was the store of Boston's first merchant, John Coggin, where shoes and yarn and other commodities were sold, and every ship brought over a larger consignment of 'Crooked Lane ware.' From his windows, Mr. Wilson could see, too, the building of the first Town House, set high on its pillars, with a 'pavement' beneath where 'the merchants do congregate,' and in front the sundial and the pillory.

But even this instrument of public weal could not remedy all evils. It seems that in 1638 the 'costliness of apparel' and the 'new fashions' were scandalous. The court ordered the elders to rebuke the evil, but they were not very successful, for, as Winthrop writes, 'divers of their own wives were in some measure partners in the general disorder.'

Quite different from the gentle Mr. Wilson were the Mathers with their ponderous learning, walking the streets on sterner errands, as attending in the Council Chamber, or wrestling with the soul of some malefactor condemned to be hanged. Cotton Mather kept a watchful eye on the signs of the times and in 1686 warned against the 'discourse to produce stage plays in New England now.' It was not until 1750 that such an event occurred, and then, in the British Coffee House on King Street, two Englishmen with several volunteers gave Otway's *Orphan or Unhappy Marriage*. There was a great rush for places so that a small riot ensued, and several derring-do Bostonians spent the night in jail, no doubt lamenting the eagerness and zeal which had brought them to such a sorry pass.

As the town grew, the aspect of King Street became more and more commercial. Along with the dwelling houses of Pastor Wilson, Captain Pierce, of the *Mayflower*, Governor Winthrop, Elder Leverett and his son, the Governor, there were numerous shops, among them two bookstores and a circulating library. The Town House had burned in 1711 and the State House had been erected on its site. There were also the Royal Exchange Tavern, the Admiral Vernon, the Marlborough Head, the Rose and (Concluded on page 30)

*Drawn by Stanley W. Woodward.*
Boston's old red brick State House.

# MR. FORD'S PAGE

THE people grow rather weary of the so-called 'war debts,' and the main source of the weariness is that the public mind has had so little material upon which to work. The intellect of man goes stale under the task of making bricks without straw, that is, considering events and policies without having basic principles to guide it.

The fact is rather commonly overlooked that the debts of war are paid, though perhaps not all the profits of war are paid, and it is doubtless better that they should not be. Every pound of every material used in the war has been paid for. Labor and material command cash, even though the entire fabric of war finance should be reared upon debt.

It is the finance of war that gives rise to wrangling among the nations, and this wrangling is not altogether the result of financial transactions between governments, but largely the transactions of international bankers—a class who will go on collecting war profits until the outbreak of the next war, if they are permitted.

No loss would come to the world if the whole edifice of war debts remained in its present confused state. It is not expected by either debtors or creditors that any of the debtor nations will continue for sixty-two years to pay increasing sums of money to the United States. No one now living can visualize the world of 1988. Two generations will have passed, all conditions will have changed, human views and attitudes will be materially altered, and purely financial arrangements made today will wear then an aspect impossible for us to forecast.

We have only to consider the difference between the world of today and that of 62 years ago—say, in the year 1864—to see how wide-reaching is the possibility of change. But even that comparison with the past is not sufficient, since the momentum of change has been incredibly accelerated during the past fifteen years beyond that of ten times the period before. We now accomplish in five years what formerly required a century, and with the increase of means has come an even greater speed in the development of thought.

The statesmen of today have not the strength or wisdom to bind the future. If they serve as a bridge over which the best of the past can be transferred intact to the service of the future, they have done their utmost. The impression is unavoidable that what the statesmen have really done in the matter of debt settlements has had merely the effect of shunting them on to the shoulders of the future which, let us hope, will find some more original way of dealing with them than merely collecting them. This generation of statesmen lacks imagination and moral courage, a lack which the future doubtless will abundantly supply.

In the meantime two kinds of good may be observed. There is a destiny which brings good even out of the stupidity of men. During the present troubled time overseas, the pressure of debt demand, even if not the strain of debt collection, may have the effect of restraining the amount of war preparation and the haste with which it is made. Money owed for the last war cannot very honorably be used in preparing for the next. At least, the importunity of creditor nations may furnish an excuse for statesmen who wish to unload the burden of war armaments from their people. So that even a blind policy which sees no further than the money involved may have the immediate effect of preserving the balance in favor of a longer period of peace.

> *NO HARM would come to the world with the repudiation of war debts; on the contrary much good might be expected. The nations least inclined to face their war debts are the more warlike nations anyway, and if they lose their credit it will simply mean that their power of creating mischief will be curtailed. The war is paid for anyway. All the debts are paid. Maybe all the profits are not yet paid, and it is just as well that they should not be. No depth of degenerate savagery was ever so low as the practice of making profit out of war. Profits trace back to persons. And if these persons are traced, the sources of war are found.*

The other good which we may reasonably expect is that future war credits will be withheld from the warlike nations. It is to be observed that it is the nations which at the moment are most busy breathing threatenings and slaughter, that have been most remiss in facing the question of their war debts. This situation is not devoid of hope. On the contrary, it would be an excellent thing for the warlike nations entirely to lose their credit by slowness to pay or by definite repudiation. The forces of destruction have heretofore had a too ready command of the resources of the world. Credits for war have always been greater in amount and easier to obtain than credit for peace. If it should appear in a future crisis of the world that the trouble-makers are also the debt payment evaders, and the judgment of the world should be that their credit is no longer 'good,' that would not be a cause of despair to the lover of peaceable and constructive activity.

It is a good thing to talk for peace, but it would be a much better thing for our people to get a clear view of the interests which work for war. War has causes which can be traced to the deliberate intention of persons. The fact is too hideous for some people to believe. And so they go forward with a kind of pacifism that refuses facts.

## Farmers Not Fooled, But Buncoed

A SERIES of victories by the Power Combine over agriculture and the national defense at Muscle Shoals constitutes the history to date of that great Government war and peace enterprise. Muscle Shoals was planted by Congress in the geographical heart of the country to supply munitions of defense in time of war, and fertilizer for farms in time of peace. The Power Combine has been successful until now in defeating both of these objectives of Congress.

It first employed the method of demanding that Muscle Shoals be scrapped. 'Not a nickel,' said the Power Combine to Government requests for bids on the valuable property—'Not a nickel. Scrap it.' The teamwork of the Combine was perfect. On every hand the great works at Muscle Shoals were belittled and condemned. The Power Combine, in answer to the Government's request for bids on Muscle Shoals, in 1921, said that neither 'private capital nor the United States can afford to invest additional public money to complete the dam and hydroelectric power at Muscle Shoals, Tennessee River.' The Fertilizer Combine joined with its chorus 'Fertilizer cannot be commercially and profitably produced at Muscle Shoals.' *Then*, in response to the Government's request, Henry Ford made an honest offer, which at one stroke proved that Muscle Shoals could be completed by private or public capital, and *he guaranteed to produce fertilizers.*

Mr. Ford's offer saved the Government's investment at Muscle Shoals, so that even a small auxiliary plant sold for $3,472,487.

Then the Combine which said Muscle Shoals was 'not worth a nickel' and wanted it scrapped began to fight the Ford proposal that made it worth millions and worth putting into production. Their purpose was the same in both instances. That purpose was to *eliminate* a great works which, under competent management, *could break the Power Trust, the Chilean Nitrate Trust and the Aluminum Trust in the United States.* This had to be prevented at all costs.

To prevent Muscle Shoals from being used to expose the gross overcharge made for power; to prevent exposure of the gross robbery of the farmer in fertilizer, the Power Combine strained every resource. It would not permit Muscle Shoals to be operated *except* as a component part of the system of super-power exploitation now practised upon the American people. That explains the long fight made against the Ford offer.

Note now their present tactics. Unable longer to say Muscle Shoals is 'not worth a nickel' (the Ford offer has given irreducible value to the great works), the Combine now seeks so excessively to overcapitalize it by usurious interest payments to the Government that the people served by Muscle Shoals will *be paying more for power trust finance* than for actual power or actual products originating at the Shoals.

Between these extreme and contradictory attitudes, which yet agree in the main purpose of preventing Muscle Shoals being used for the people as against the trusts, there is much history that need not here be repeated. The cry of 'scrap it' five years ago has changed to the cry of 'exploit it' today. Behind both cries is the determination of the Power Combine to keep the economies of Muscle Shoals away from the people. Its importance to the national defense has been absolutely lost sight of; its unity has been imperiled by weasel amendments inserted by the Senate in House Concurrent Resolution 4. Congress spends days talking about farm relief, while Muscle Shoals, a great source of practical relief to the American farmer, goes neglected. The Power Combine has succeeded in putting it over President Coolidge and the Congress.

Such a sweeping victory for such a sordid program finds no comparable instance save the initial negotiations for Teapot Dome.

The situation at present has two aspects: First, the contentment of the Power Combine that no final disposition of Muscle Shoals shall be made, because right now the Combine is the beneficiary of the power that is being produced at the Wilson Dam power station. The Government sells the power to the Power Combine at a price which makes it almost a gift. Second, the present offer and bid of the Power Combine, recommended by a majority of the Joint Committee, proposes to charge all that the running water will bear regardless of its cost, and this financial arrangement is designed, not to produce economic fertilizer at Muscle Shoals, but to defeat its economic production.

The Power Combine's fertilizer offer, favorably reported by a majority of the Joint Committee, *does not guarantee to make fertilizer at Muscle Shoals.* The Power Combine is bound to

nothing more than an experiment in making fertilizer. The language of the proposal is very clear on this—if the synthetic process does not work, 'some other' method may be tried, and no limit is placed on the number of methods they may try nor the amount of time they may spend in experimenting. *This does not promise fertilizer.* The Power Trust which is preventing Muscle Shoals from reducing the cost to the power consumer is not going to injure its sister trust by reducing the cost of fertilizer to the farmer.

It has long been accepted by those at Washington who stand for national defense and the production of fertilizer at Muscle Shoals, that no offer except one 'as good or better than the Ford offer,' should be considered. The Ford offer was based on the principle of the *largest use* at the *lowest cost.* It reduced interest charges to the minimum. It was, in fact, an *engineer's* proposal, not a *banker's* proposal. Mr. Ford never could understand, and does not understand today, why bankers should be permitted to *collect interest from power consumers on the regulated flow of a river.* In Henry Ford's proposal sinking fund payments were placed at four per cent interest, compounded annually, which would return to the Government at the end of 100 years the capital cost of the Muscle Shoals dams. The offer by the Power Combine to pay a maximum of $1,800,000 at these two dams on account of headwater improvements can be considered as the Power Combine's sinking fund plan and compared with Henry Ford's sinking fund plan. The saving between the Ford plan of amortization and the Power Combine's plan is the difference between $81,000,000 and $3,232,000, or $77,768,000. *The public pays the difference.* Henry Ford proposed to produce *power* and *fertilizer;* the Power Combine proposes to produce *watered stock* and *dividends.* Worse than that; it asks the Government to go partner in the scheme and the majority of the Joint Committee on Muscle Shoals actually agrees!

Thus, it is clear that under the Power Combine's plan, Muscle Shoals is removed as a factor compelling the Power Trust to reduce the price of power, and the Fertilizer Trust to reduce the price of fertilizer. Watered stock, interest charges, dividends and high cost of power now have the right of way IF the uninterrupted victories of the Power Combine continue.

President Coolidge once said, in anticipation of a lower bid than the Ford offer being made: 'While the price is an important element, there is another consideration even more compelling. The agriculture of the nation needs a greater supply and lower cost of fertilizer.'

Does the President not know that with the higher price offered by the Power Group for Muscle Shoals power, 'a greater supply and lower cost of fertilizer' is impossible?

Does not the President know that breaking up the unity of Muscle Shoals by substituting 'leases' for 'lease' is an unpatriotic destruction of Muscle Shoals as a great defensive unit?

Does not the majority of the Joint Committee on Muscle Shoals know that the acceptance of grossly excessive capitalization at Muscle Shoals means a disgraceful betrayal of the farmer?

It all comes to this:

Those who failed to scrap Muscle Shoals by saying it was 'not worth a nickel' are now trying to hamstring it by loading it with interest-bearing Government capital. Either way, it comes to the same thing so far as the establishment of the electrochemical industry at Muscle Shoals and the production of fertilizer for farmers are concerned. The farmers can go to Chile for their nitrates as in the past, and the electrochemical industry can go to Canada and Norway as it has been doing, and the water power on the Tennessee River can go on to waste by non-use, until the Power Combine gets ready to exploit its use.

## *Scott Nearing as Prophet*

THE *Columbia Spectator,* official newspaper of the students of Columbia University, New York City, discovers, in its issue of May 11, that during last February, in a speech given before some students at the University, Scott Nearing prophesied a social revolution in England in the near future. The *Spectator* staff was thrilled. In a two-column heading, on May 11, it announced, 'Scott Nearing Predicted British Revolution in Address Given on Campus Last February.'

And then, line by line, the prophecy was dug up. Scott Nearing had prophesied, what all the world knew, that the coal miner's subsidy expired May 1. He prophesied what everyone knew, that this termination of the arrangement would cause discussion and probably strikes—'strikes which would be serious and far-reaching.'

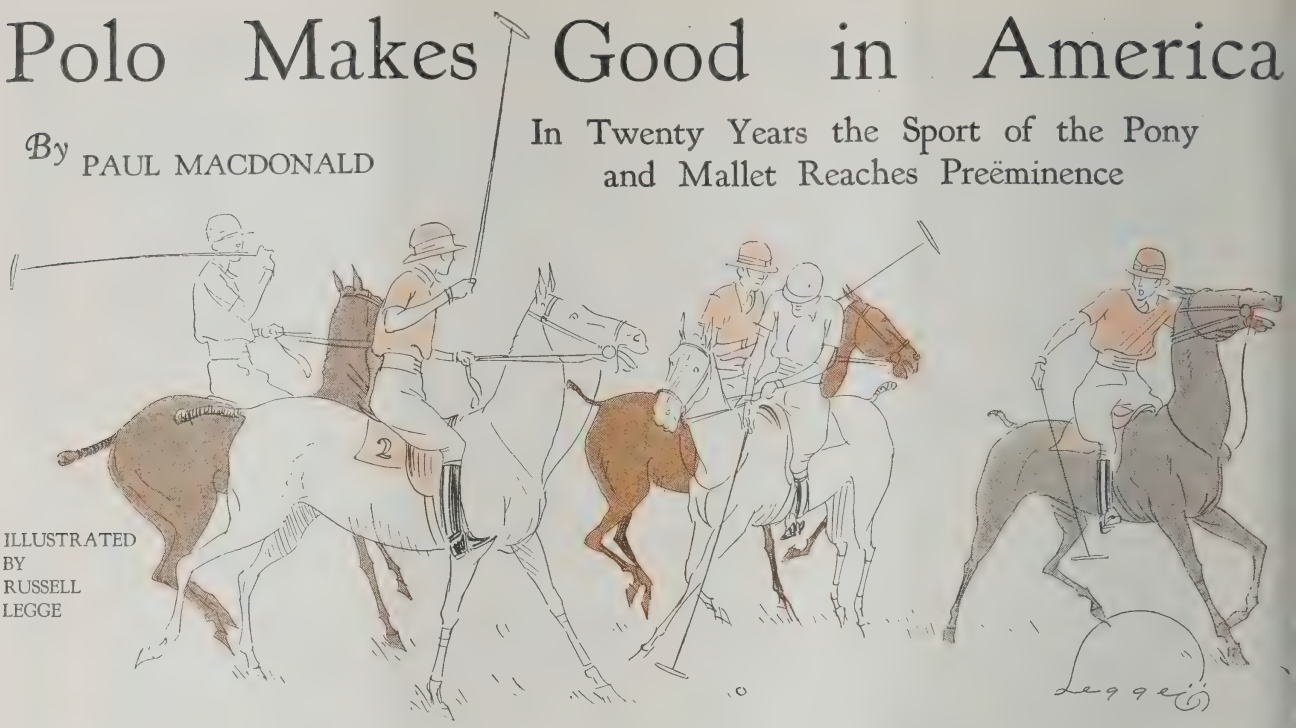
'Then,' said the prophet, 'either the laborers will back down or else they will fight.'

There is foresight for you; they will either do something or they will not. Truly the nation is blest that possesses men of such preternatural vision into the likelihoods of the future.

**'And if they do fight, it will be a fight with guns.'**

Unfortunately for journalism and prophecy, the strike was hardly commenced before it was over. The day after this quoted issue of the *Spectator,* the strike was over.

*There was no social revolution.*



**Not a shot was fired.**

Scott Nearing lived with the alien mind so long that he forgot his own people.

# Polo Makes Good in America

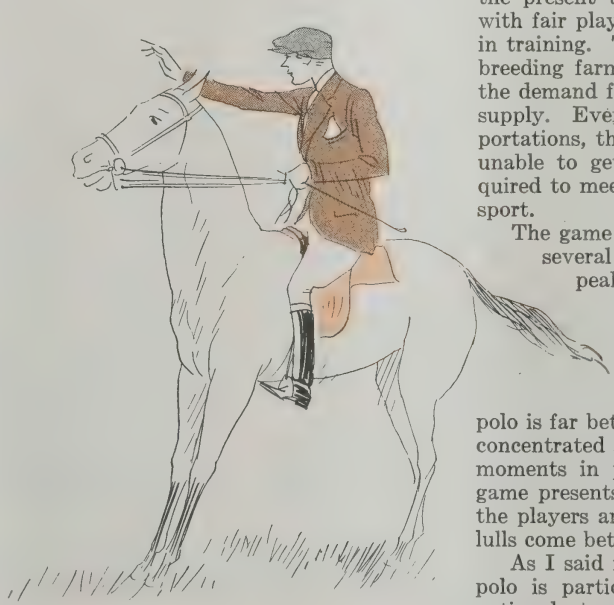
## In Twenty Years the Sport of the Pony and Mallet Reaches Preëminence

By PAUL MACDONALD

ILLUSTRATED BY RUSSELL LEGGE

POLO is a sport and a spectacle. It is one of the most thrilling of sports and, in many ways, the most spectacular. What finer picture can the mind imagine than a polo match on a clear summer day? The colorful crowds gathered around the stage of level turf; the uniformed riders; ponies, well-groomed and highly trained; hoof beats; swinging mallets; a bamboo ball painted white, bounding and rolling over the grass surface; horses and men; men and horses!

It is a game that demands speed, strength, endurance, dash, quickness of decision, courage, self-restraint and teamwork. All these qualities are almost constantly brought into play. It is a game that we imported but that, due to its strong appeal to our national temperament, we have come to look upon as one of our own.



Twenty years ago polo was hardly known in the United States. Ten years later only a few cities had a glimpse of the sport. Today polo is played from ocean to ocean and border to border.

The best way to show the tremendous growth of polo in recent years is to resort to statistics. In 1922 there were exactly 50 clubs affiliated with the United States Polo Association. In 1924 there were 81 clubs and 150 playing fields. This year there are 135 clubs, 540 teams and 300 playing fields.

In the space of four years the number of clubs affiliated with the governing body of polo in the United States was tripled and in two years the number of playing fields was doubled.

But these statistics, as well as the figures that follow, relate only to the clubs officially recognized. There are a large number of clubs and playing fields that have not acquired memberships. These have sprung up in the last two years and their playing strength is not yet sufficient to warrant membership and official recognition by the governing body. In another two years there will be twice as many polo clubs affiliated with the association and twice as many playing fields as there are today.

The game is fast being accepted as a college sport. Early in 1925 the Intercollegiate Polo Association was formed with eight charter members: Cornell University, Harvard University, Norwich University, Pennsylvania Military College, Princeton University, United States Military Academy, Virginia Military Institute and Yale University. While the charter list of the college association numbered only eight members, polo was played last year in fifteen colleges, all of which recognized the game as an intercollegiate sport. This number will be doubled by next year.

Polo is played in all the army posts. The war office has a department devoted to polo in the army. Nearly every regiment of cavalry and infantry has a team. There are about 1,500 soldier players given handicaps.

Outside the army there are approximately 2,000 players of some standing in the United States today and it is impossible to present figures on the number of beginners who have taken up the game in the last year or two.

There are owned in this country at the present time about 15,000 ponies with fair playing qualities. Others are in training. The number of polo pony breeding farms is ever increasing, but the demand for ponies still exceeds the supply. Even with the numerous importations, the United States has been unable to get all the polo ponies required to meet the development of the sport.

The game is on the rise. It will be several years before it reaches its peak and in the future there may come a day when polo will supplant baseball as our national pastime.

As a sport of thrills polo is far better than baseball. It has concentrated action. There are no dull moments in polo. Like hockey, this game presents continuous action while the players are on the field. The only lulls come between chukkers.

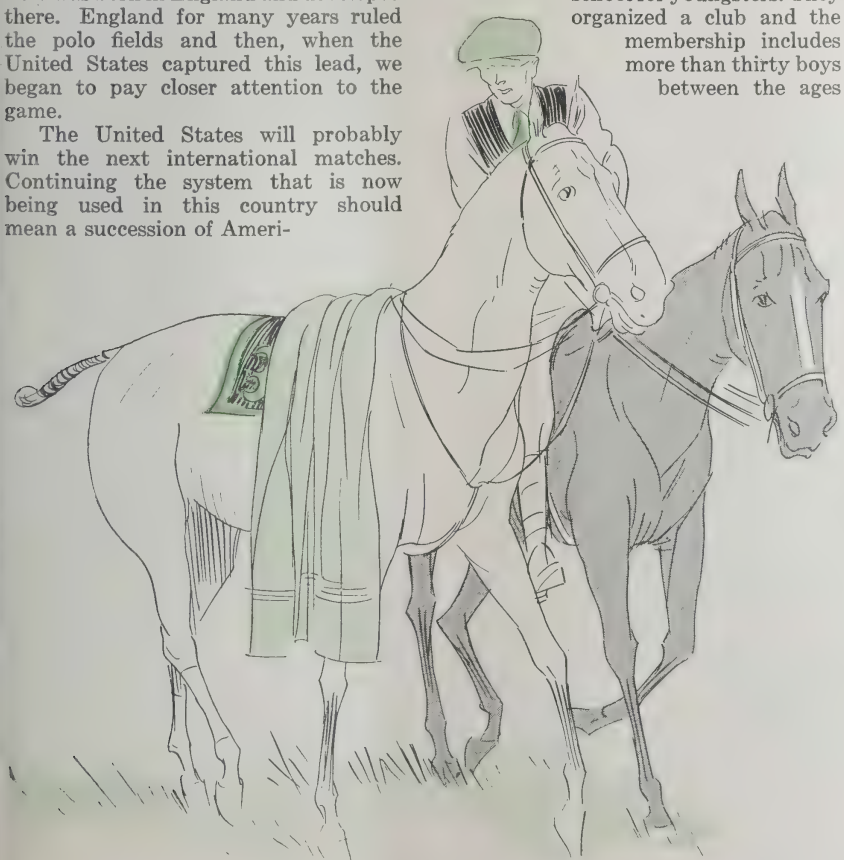
As I said in a foregoing paragraph, polo is particularly appealing to our national temperament. We crave

plenty of action. Polo provides it. We like speed, dash, quickness, daring and color. Polo has all that. It is true that every able-bodied man can play, or try to play, baseball, but that not every able-bodied man can learn to play polo. Many also cannot afford it.

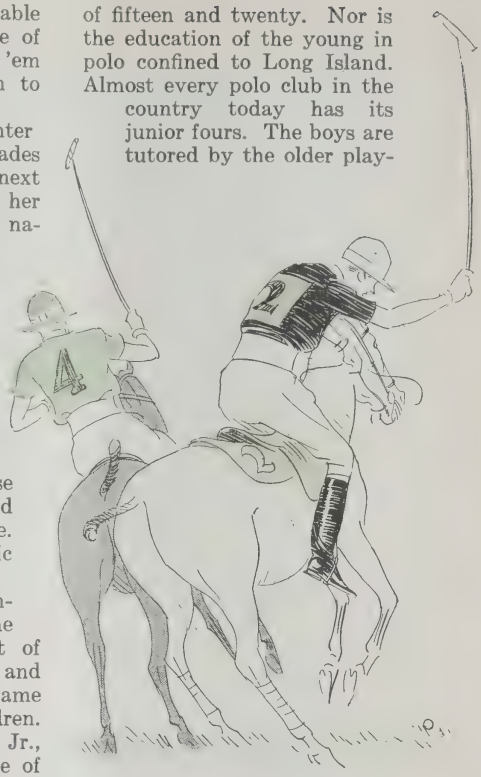
Polo costs more money than golf, although the difference, all items considered, is not nearly so great as you would imagine. Still, the fact that everyone cannot play polo for one reason or another does not signify that polo will not draw. Consider football, as an example. Comparatively few men play football, and yet none of the mammoth stadiums is large enough to take care of all those demanding seats for a big game. Football draws millions each year because it is a spectacle. Polo will draw for the same reason.

No one has to play polo to appreciate it, and when you get right down to it, polo is much easier to understand than football. Anyone that watches a polo match can comprehend the game. The entire play is in the open. That, as a sport spectacle, is the game's chief virtue. It is likewise the chief virtue of baseball. Polo has infinitely more action than baseball and other elements of sport drama that baseball does not possess.

The overwhelming victory that the United States scored over England in the last international matches unquestionably aided the rise of polo in this country. It fed our national pride. Polo was born in England and developed there. England for many years ruled the polo fields and then, when the United States captured this lead, we began to pay closer attention to the game.



The United States will probably win the next international matches. Continuing the system that is now being used in this country should mean a succession of American victories. It is an unbeatable system. Reduced to the language of the streets it is simply this: 'Get 'em when they're young and hold on to 'em.'



We are today preparing for international matches one and two decades removed. It is certain that the next time the United States defends her polo honors against a challenging nation her lineup will not be the same as the one that defeated England in 1924.

The boys of today will be the champions of tomorrow and in polo the policy is farsighted. The polo center of the United States is located on Long Island, and here, within a radius of fifteen miles, can be found nineteen polo fields. Twelve of these grounds are privately owned and kept up at their owners' expense. They are thrown open to the public when matches are played.

Mr. and Mrs. Thomas Hitchcock have undoubtedly been the chief factors in the development of polo in this country. Both Mr. and Mrs. Hitchcock have played the game for years and taught it to their children. They developed their son, Thomas Jr., into the best No. 2 on either side of the broad Atlantic, and in the history of American polo he has had but one superior; that was the brilliant Devereux Milburn

The Hitchcocks use their Long Island home as a training school for youngsters. They organized a club and the membership includes more than thirty boys between the ages of fifteen and twenty. Nor is the education of the young in polo confined to Long Island. Almost every polo club in the country today has its junior fours. The boys are tutored by the older players. They are provided with mounts, uniforms and all needed equipment. Some of the English players who came with the international team in 1924 remarked, after watching the boys' teams play in this country, that many of the American Junior teams play better polo than a considerable number of representative club teams in England. While they lack the strength of the mature players they have a much better tactical knowledge of polo.

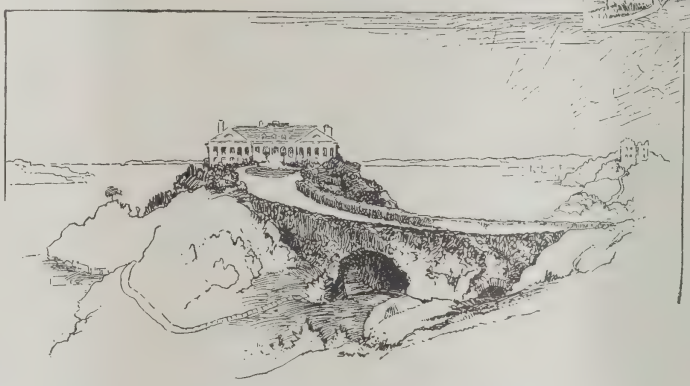
Americans are past masters in organization in any branch of sport they undertake and their detail work is unrivaled, according to the observations of an English poloist. Their forethought and careful preparation eliminates, where humanly possible, the risk of defeat.

While we were a bit tardy getting into polo, we have managed to do fairly well since taking up the sport. Today America rules the game, but America will show still better teams than the great combination that crushed the invaders on the Hempstead Plains at Meadow Brook back in 1924. That team was regarded as the best ever mounted on a polo field, but there will be even better teams in the future with polo played by high school and college boys, for, after all, we are just getting started in polo.

Polo is the most ancient of games with stick and ball. Hockey, and possibly golf and cricket, is derived from polo. The earliest records of polo are Persian. It spread to India and thence to Britain, where it was first played by the 10th Hussars in 1869. It was then taken up by other cavalry regiments in different parts of the world.

# Newport, Our 'Social Capital'

## A Sumptuous Array of Palaces by the Sea

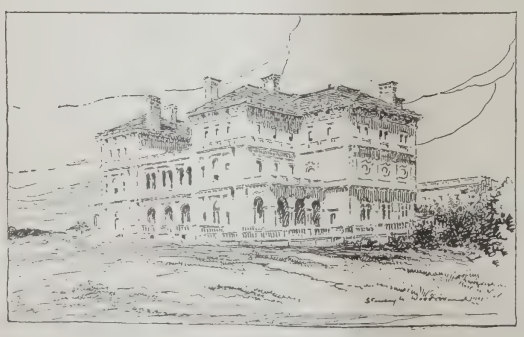


By ALICE YOUNG

PERHAPS you can recall a time when the drop curtain at the theater was in your eyes the acme of art. In comparison with its glories the most famous masterpiece became childishly futile, and, between the scenes, you conjured up romance and melodrama for which it would be the ideal setting. That is Cliff Walk at Newport, a succession of drop curtains, each more prodigal of its beauty, more bewildering to the imagination, than the previous. There are no reserves, no half tones. Shimmering marble, ruddy brick, exotic decoration—for more than three miles the view extends, shifting at every turn in the path, but always with the saving grace of the sea sweeping across the foreground, dashing its white spray upward as a sign that it is still unconquered. There is no other walk like it in the world. It is as great a marvel in its way as the Chinese Wall or the catacombs of Rome.

You may wonder how it is that wealth, commonly so jealous of its rights, permits such an infringement of its privacy as a public walk across its lawn. It does not permit; it submits. Years ago a provision of the town gave the fishermen perpetual right-of-way along the cliffs, and every effort to revoke that ruling has proved fruitless. Yet society is really the gainer, although it probably does not care a fig for its blessing. Seen from the avenue on the other side, the sumptuous array of palaces is not altogether pleasing. At times it is almost messy. A scant minute and a half is not enough time in which to be rolled from one period to another five hundred years away.

Gateway of 'The Breakers.'



'Beacon Rock,' residence of E. D. Morgan.

But from Cliff Walk, where the open stretches of the sea give breathing space, everything takes on a more harmonious perspective. With the soft marine tints in the foreground, the 'Marble Palace' rises in loveliness almost ethereal, and the magnificence of 'The Breakers' no longer oppresses, but exhilarates. The French chateau, copied from one of Henry IV, and designed for the soft river country of the Loire, seems to adjust itself to the crags of its New World setting, as the eye, bewildered by so much splendor, loses its critical faculty and gives itself up to sheer delight in beauty.

But a Cliff Walk, however marvelous and enchanting it may be, cannot exist by itself, and what about the rest of the city? Does the proximity of so much gorgeousness lend a little elegance and inspire some love of beauty for beauty's sake? Alas, no. There seems to be a scant sense of spiritual values in Newport streets. You may walk the length of its main thoroughfare, Thames Street, and inquire vainly in every shop for a view, even a penny post card, of such a treasure as the Redwood Library, the oldest library building in the country, and for many years housing a collection second only to that of Harvard. In most places a surprised shake of the head will be the only answer, but occasionally there may be a comment, 'This is all folks here want to look at,' with a deprecating glance toward a picture of the Casino, decked out in lurid colors.

For Newport had her 'golden age,' as President Faunce, of Brown, happily puts it, before her 'gilded' one. Here was established the first public school in the country, perhaps in the whole world. In 1728 there was a flourishing Philosophical Society, and in 1747 enough general appreciation of culture to raise money by popular subscription to build a library. Abraham Redwood, a Quaker, gave his personal collection, and a fund for the purchase of new books in London, and an uncle of Sir Walter Scott became the first librarian.

The building, severely classic in line, with Doric portico, was erected on land which was formerly the

'The Breakers,' residence of Cornelius Vanderbilt.

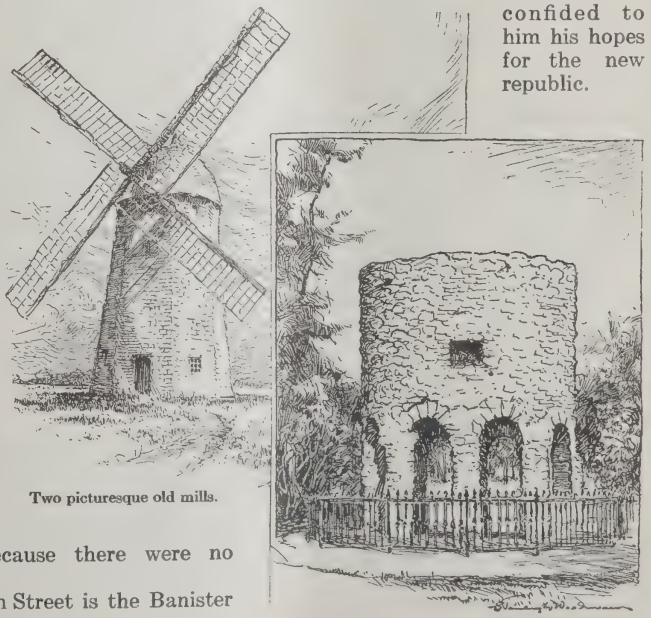
Church Street, showing spire of Trinity.

bowling green. Shading its entrance is a tree, which for loveliness, I think cannot be surpassed by any in America. It is, or so it is claimed, the first of its kind, the product of grafting a fern on a beech. The long drooping branches, with fern-shaped leaves, make a canopy across the street on one side, and sweep the library lawn on the other. During the Revolution, in British occupancy, many valuable books were destroyed, and the handsome interior so mutilated that, at the request of Tory citizens, a sentry was placed at its door to prevent further destruction. In later years George IV sent a contribution of money as a peace offering to repair in some measure the havoc wrought by English troops.

In fact, the only building of any importance in Newport which was not damaged by British hands was Trinity Church, which was saved by the crown and pennant which still glitters on the top of its slender spire. The interior, save for the intrusion of modern stained-glass windows, through which the sunlight blushes to steal, retains its colonial appearance, with boxed-in pews and a pulpit which is probably the only three-decker in use in the country, with reader's desk above the clerk's, and, on a level with the galleries, that of the rector. About the walls are numerous cenotaphs, ranging in scope from that of Admiral de Ternay, commander of the French fleet, to that of Alfred Gwynne Vanderbilt, 'lost at sea' in 1915.

Trinity still has in its possession some of the communion silver given by Queen Anne, and, resting mutely on a table in the vestibule, the bell sent over in 1702. But the chief treasure is the organ, at least the front of it, for the pipes have been replaced, presented by Bishop Berkeley when that distinguished Irishman paused at Newport, on his way to educate the natives of Bermuda, and became so enamored of its beauties that he lingered two years, leaving the heathen to rage as they were wont. The cottage which he built and christened Whitehall in memory of his sovereign is still standing and a jut in the rocks bears the name 'Berkeley's chair.' It was here that the Bishop wrote an uncommonly long and dull poem which has been saved from oblivion by one immortal line,

'Westward the course of Empire takes its way.'



Trinity Church.

On the old Parade Ground, renamed Washington Square, are many reminders of colonial days. At the head of the Square is the State House of 1743, perhaps not great architecturally, but certainly distinguished in appearance. From its little balcony on the second story many portentous events have been heralded. Here was proclaimed, amid more or less indifferent huzzaing, the accession of George III, and here, in the solemn hush of a great resolve, was read the Declaration of Independence. Only a short way distant, on the corner of Malborough Street, is the Nichols House, famous in 1740 as the White Horse Tavern. Just below is the old jail, delightfully hospitable looking, and where, it is said, the prisoners of colonial days grumbled because there were no locks.

In Pelham Street is the Banister House, the headquarters of General Prescott when he tyrannized over the town and made himself especially obnoxious to the Quakers by forcing every woman to curtsy and every man to doff his hat when he passed by. His soldiers employed their spare time in digging about the gardens and at the roots of apple trees, searching for treasure which the inhabitants who had fled the city might have buried there. Their greatest find was the press of the *Newport Mercury*, a paper which was founded by an elder brother of Benjamin Franklin.

Of more genial and romantic memory is the Vernon House in Mary Street, the home of Rochambeau when his fleet rode at anchor in the harbor. There were gay times in Newport then, fêtes and torchlight processions, and balls. Even the neighboring Indians flocked in to see the goings-on. But there were sad hearts in the midst of the gaiety. Only a few days after their coming Admiral de Ternay died, and his funeral cortège, which landed at Long Wharf, fairly thrilled the city with its brilliancy. Here languished, too, the youthful Count de Fersen, lifelong friend of Marie Antoinette.

After the pomp of Versailles, the Vernon House seemed ridiculously inadequate, and Rochambeau lost no time in building an adjoining hall where he might entertain. That has vanished long ago, but the Vernon House met a happy fate in being purchased by the Charity Organization. Its north parlor, with white paneling and wide fireplace, is the same as when Washington visited the French leader and confided to him his hopes for the new republic.

Two picturesque old mills.

# The Voyage of the Victoria

*Fourth of a Series*

BY CHARLES J. FINGER
WOODCUTS BY PAUL HONORÉ

## 'THE PART PLAYED BY COMMERCE KINGS'

CUNNINGHAME GRAHAM, than whom no historian is better qualified to speak of the relations between conquistador and king, has said in his *Conquest of the River Plate* that Charles V, the King of Spain, had never money to assist any of the conquistadores, and the conquests of Pizarro, of Quesada and of Cortés were private enterprises. But history is silent where the names of those who really directed energies are concerned.

The world saw the glittering stage hero under the limelight, and forgot the playwright. In the case of the first world voyage, there has been an absurdly exaggerated estimate of the part played by the boy king, Charles, who had not attained his majority, who cared very little for Spain, and who was surrounded by men knowing what they wanted and how to get it. So in the preparation of the fleet we find on one hand an extraordinary lack of vision that amounts to criminal carelessness, on another hand a peculiar unity of aim and faith and mission. Because of that, those with a bent to hero-worship have eulogized Magellan tremendously as one whose lifelong devotion to his ideal somehow caused him to permeate order, and to move among adverse circumstances with stout cheerfulness. With such, there has been a Carlylean 'Saw ever the world one greater or unhappier?' but no recognition of those masters and backers of his who organized things; who directed, consolidated, systematically and quietly achieved.

Magellan was no soul like a star that dwelt apart, but a resolute man raised over others and backed by powerful supporters who furnished the sinews of war. He possessed indomitable perseverance, on occasion he was tyrannic, he could be cold and unsympathetic, he kept his strangle hold at all costs, and he made a valuable servant for his employers; so much so that before things had gone very far he could not be spared.

On March the twenty-second, 1518, the document bearing the royal signature that permitted the preparation of a fleet to 'go in search of *the* strait,' not *a* strait, was handed down, and from that time until September the twentieth of the year following, when the fleet sailed, there were arguments, intrigues, veiled enmities and jealousies. That was where there were appointments, or where officialdom clashed with Magellan's desire for complete mastery. In other places there was keen-eyed vigilance, and there was effectiveness, and that was where commercial advantage beckoned.

For instance, consider the matter of equipment. In the list of tools and appliances we find the absurdly inadequate equipment of five hammers, one for each ship. There were only two grindstones. There was only one hone. There were eight pairs of pincers and no more than five iron ladles for the handling of pitch for caulking purposes.

As for the ships themselves, there again organized government seemed to laugh at prudence and take reckless risks. For Aranda bought them at Cadiz and it was a case of an untrained man undertaking an important mission for which he was in no way fitted. We get some notion of their condition in a passage taken from a letter written to the King of Portugal, by his agent in Spain, Alvarez. He says: 'They are very old and patched, and I would be sorry to sail even for the Canaries in them, for their ribs are soft as butter.' But the royal influence was at that end of the preparations, for the King, or his advisers, had agreed that Aranda should purchase the ships, and that equipment should be bought here and there, some of it in Flanders, the King's country, as it was called.

But a different state of affairs is revealed when the list of articles intended for trading and exchange and barter is examined. There we get a feeling of businesslike energy doing things with proper foresight. In fact, the five ships with rigging and boats cost considerably less than the articles of trade and barter that went in them. And those articles were chosen in the light of the experience furnished by other explorers. There were colored handkerchiefs, pieces of velvet, cloths, brass bracelets, twenty thousand little bells, ten thousand fishhooks, copper rings, four hundred dozen little knives, pieces of colored glass to the weight of five hundred pounds, six hundred pairs of little scissors, two hundred red caps, the same number of little brass basins, a thousand looking-glasses, and much more. For that end was attended to by the Haros and the Fugger brothers, or their agents, who were men of abundant sagacity and knowledge and experience.

Compare that foresight with the ignorance of the other side, especially in the matter of the comfort and well-being of the crews. For the officials of the *Casa de Contractacion* considered one surgeon-physician and one medicine chest ample for the five ships, but gave each ship a drum and four tambourines 'to serve for their pastime.' And while they spent 13,027 *maravedis*, a little over $30, on 'medicines, unguents and salves,' they furnished Luis de Mendoza with 15,000 *maravedis* to spend in the Canary Islands on 'various necessaries,' unspecified.

By agreement and royal instructions, two of the ships were to be of 130 tons each, two were to be of 90 tons each, the remaining one of 60 tons,

and the aggregate tonnage of Aranda's purchase came approximately near to that. Thus:

| | |
|---|---|
| *The San Antonio* | 120 tons |
| *The Trinidad* | 110 tons |
| *The Concepcion* | 90 tons |
| *The Victoria* | 85 tons |
| *The Santiago* | 75 tons |

Supposing the word tons to be the generally accepted one, that is, the measure of cargo which the vessel might carry in safety, an idea of the capacity of the ships may be formed by remembering that a modern railroad freight car has, on an average, a load limit of fifty tons. For the description of the ships, how they were rigged, what masts they carried, what length of service they had seen, there is no record. We know, reading de Herrera, that they carried, fore and aft, tall castle-like structures in the fashion of the day, and we assume that they were decked. If we go by de Bry's picture of Lisbon Harbor in which such ships are shown, we assume that they were so low in the waist that the head of a man standing in a boat alongside would be well over the bulwarks. But de Bry is not a safe guide and his work was written some seventy years after Magellan's death.

The tale of the contentions and jealousies and hatings and harryings and misdoings that befell in the year of preparation would fill many books. Those with ulterior motives who sought place or enrichment by contracts or profit-mongering sprang up like weeds. Shrewd men with an eye on their own security and their own material and political advantages were as prompt to appear as in our own day. There were spies and special reporters everywhere, some engaged by the investing merchants to watch their interests, some by the *Casa de Contractacion*, some by the King of Portugal, some by those at court. There were unseemly controversies and bickerings and little riots. There were criminations and recriminations, and those who were appointed to serve under Magellan often denounced him to their masters as a violent, self-willed and quarrelsome man.

By way of instance, there is the case of Luis de Mendoza to whom the money was given which was to be spent as he saw fit in the Canaries. He was a Spaniard, appointed by the King to be treasurer of the fleet at a yearly salary of 60,000 *maravedis*, some $165 calculating in our money. By the same order that gave him his appointment, a Juan de Cartagena was appointed overseer-general and captain of the *San Antonio*, at a salary of 110,000 *maravedis*, or $300 odd.

On the heels of that, another king's man, Antonio de Coca was made accountant or auditor at a salary of some $138. But there had been an understanding at the outset that Magellan was to choose his own men, 'on account of his experience.' And every one of those appointed held himself to be superior to his commander in birth, education, family and rank, not to mention nationality. As Alvarez wrote to Dom Manoel, the Castilians held Magellan for a 'low person and of no breeding.' So soon there was friction, with Magellan complaining to the King that Mendoza had been insolent; in return, Mendoza was rebuked by King or adviser. In that seeds of dissension were sown that bore bitter fruit later. Similarly there came trouble through Juan de Cartagena, who suspected Magellan of favoring Portuguese over Spaniards, whereupon, after some wire-pulling, Magellan was summoned before the officials of the *Casa de Contractacion*, and appeared defiant. Those of the *Casa* mated his move by approving payment of all Spaniards employed, but not of Portuguese. So there was discord active and potential and things petty, sordid and mean were afoot.

Nor was all smooth between Magellan and Faliero, who had been appointed to command equally with his partner. Magellan held that a creature with two heads was a monstrosity; wanted sole command and fought for it. Alvarez reports Faliero as having told him in confidence that once afloat he 'was not going to follow Magellan's lantern' but would navigate to the south and follow his chosen course. For Magellan, it seems, had it in mind to follow the course of his predecessor, the navigator sent out by Christopher de Haro. So with one thing and another Faliero was doomed. Soon the King, or some one near him, deprived Faliero of his command, promising him the post of admiral in a second expedition to follow Magellan. That promise came to nothing, and after a time Faliero returned to Portugal, where he was imprisoned as a traitor.

There are on record two letters which he wrote from prison urging the sending of a second expedition and asking that his promised pension be paid him, as he was in want, and with that he passes out of history, dying, presumably in Seville, in 1523. But Magellan had all that he wanted from Faliero, including the one copy of the book of thirty chapters made by the geographer, it being invaluable for the taking of observations.

To come to the end of what might be a long matter, Magellan was the center of much trouble and the center of much order. In him was something of the rascal and something of the hero. He was the victim of jealousy, but he was also a faithful

(Concluded on page 29)

In the preparation of the fleet we find absurdly inadequate equipment, and as for the ships themselves, the government seemed to take reckless risks

# Where Our Admirals Come From

## Annapolis, a Sea School on Shore, Which Trains Officers for the Navy; Paul Jones Suggested It

By WILLIAM JOHNSTON MADDOX

Indian figurehead from the U. S. S. *Delaware*, built in 1817.

TRAIN sailors on shore! Old sea dogs laughed at the idea. Some of the greatest sailors of all time, like Farragut, began their sea careers at the age of ten on board ship. Hard knocks in the rough-and-tumble life at sea produced some of the best officers and finest traditions of the Navy. But George Bancroft, the historian, then Secretary of the Navy, took another view of it. Only very unusual characters, he thought, could stand such training and come out on top. What was needed was a school on shore to train boys for officers in the Navy. John Paul Jones had first suggested it, but it remained for Bancroft to put the project through in 1845 and become the founder of the United States Naval Academy. He chose Annapolis as the site.

The Academy is more than a school; it is a tradition. Here, if anywhere, the Navy keeps green the memory of its heroes. John Paul Jones, Stephen Decatur, James Lawrence—all that glorious company become intimate figures. Reminders of their exploits are all about. The very names of the streets and walks call the roll of the Navy's great ones. Each building, athletic field, and drill ground commemorates some one of them. At every turn are trophies and memorials of the Navy's achievements on every sea, in every clime, from Salem to Canton, from the Arctic to the South Seas, from the Revolution to the World War.

It is a quiet, restful spot—two hundred acres of great trees, shaded walks, stately white buildings, and drill fields. Most of the buildings have been built since the Spanish-American War, when what is commonly called the New Navy had its beginnings. They are of marble or white faced-brick. Beyond is the Severn just merging into Chesapeake Bay. Nothing could be more peaceful. On the land side it is surrounded by one of the most curious old towns in the United States, Annapolis More people undoubtedly know Annapolis as the home of the Naval Academy than as the capital of Maryland. It reposes calmly undisturbed even by a steam railway.

This is the atmosphere in which our future admirals are nurtured.

Each year about 900 youths between sixteen and twenty from every state and territory in the Union come here to start their four years' training as midshipmen. With but few exceptions, the appointments to the Naval Academy are made, according to law, by Congressmen. A few appointments are allowed the President and the Secretary of the Navy. Provision is made for admitting 100 young men each year from the enlisted ranks of the Navy and the Marine Corps. They all have to come up to the same mark mentally and physically, though. The educational requirements are about those of a high school graduate.

Midshipmen drilling with 'half-raters.'

The minute the newly sworn-in midshipman enters the Academy gate the 'whittling-down' process begins. Little rough places like being unduly puffed up over the write-up he got in his home paper before starting out are quickly smoothed down—and he is on his way toward the proper state of humility considered necessary for discipline. He finds, maybe for the first time, that he has come there to be moulded into an educated gentleman—in the naval sense.

Honor, uprightness, and truth are set up as the cardinal virtues of the naval officer. Implicit loyalty to the country is, of course, a necessity. 'My country, right or wrong—my country,' was Commodore Decatur's toast after the Tripoli War, afterward to become famous. Then, as the naval officer is essentially a man of practical aims and methods, the training at the Academy is designed to develop a practical rather than an academic mind.

Four years at the Academy doesn't make a finished naval officer by a long shot. And it is not expected to. This only comes with years

*Photo—White.*

The chapel with its golden dome is a feature of the Academy grounds. It contains the sarcophagus of the naval hero, John Paul Jones.

of actual service at sea. The work at the Academy merely lays the groundwork—just a preparation for the real schooling aboard ship. This does not mean that the course of study is not stiff. It has to be intensive to cover in four years all the subjects necessary for the groundwork of a future naval officer. And in spite of this, every midshipman is required to interest himself in some form of athletics, physical fitness being held a prerequisite for sound study. A healthy mind in a healthy body is the aim.

Each summer the midshipmen, with the exception of the graduating class, are sent on a practice cruise of about three months. The life of the Academy centers about the yard with its stately trees and its paths along which the midshipmen march to and from their recitations to the roll of a drum. Through it winds Lover's Lane, sacred to upper classmen. Here stands the big Japanese bell brought back by Commodore M. C. Perry from his memorable cruise to Japan.

Facing upon the yard is the chapel. It has large bronze doors and a golden dome. Two guns captured by the Navy during the Mexican War 'protect' it. Inside the chapel are three stained-glass windows dedicated to Farragut, Porter, and Sampson—two Civil War heroes who were rewarded with the highest rank in the Navy, and the victor of Santiago, July 3, 1898.

In the crypt of the chapel is the imposing mausoleum of our first admiral, John Paul Jones, the father of the American Navy. During the Revolution, Jones made raids in the *Ranger* and in the *Bon Homme Richard* on the British coast, raids remarkable for their daring and achievement. For more than a century after his death Jones slept in an old forgotten cemetery in Paris. Here the body was found after much effort by the American ambassador, Horace Porter. It was identified and brought back with great ceremony and pomp and deposited in the magnificent sarcophagus in the crypt.

Across the south side of the yard stretches an imposing group of granite buildings, comprising Dahlgren, Bancroft, Macdonough, and Luce halls. The first is the armory of the Academy, named after Rear Admiral Dahlgren, inventor of the first large-caliber naval gun and commander of the South Atlantic squadron during the Civil War. Because of its great floor space, the armory is the scene of the formation of the whole regiment of midshipmen for infantry drills. In 'June Week' each year it is used for the graduation exercises and the 'farewell ball.' Here, in the morning, the President of the United States hands out the diplomas and at night ten thousand persons dance in honor of the newly made officers.

*Navy Official Photo.*

Worden Field and Chesapeake Bay as seen from an airplane.

Probably the most interesting of the buildings is Bancroft Hall, the dormitory, named in honor of the founder of the Academy. The rotunda is open to visitors. From the large wooden statue of Tecumseh—the figurehead of the U. S. S. *Delaware*, whom, by the way, the midshipmen call 'the god of 2.5,' the passing mark at the Academy—may be had a good view of the north façade of the great building. The floor space covers some twenty acres. There are nearly three miles of corridors. It is capable of stowing 2,500 midshipmen, the present enrollment.

Flanking the entrance are two bronze cannon that were taken as prizes by the Navy at Vera Cruz and California during the Mexican War. Inside the great doors and up the ornate stone stairway one sees, on the opposite wall of Memorial Hall, Perry's battle flag at Lake Erie upon which are the inspiring words of the dying Lawrence, 'Don't give up the ship.'

*Photos—White.*

Above (right)—Infantry drill on the Academy grounds during 'June Week.' Below—Quarters of the Superintendent of the Academy.

Along the walls of Memorial Hall are many portraits of naval officers famous in American history such as Bainbridge, victor in the *Constitution-Java* fight; Cushing, who torpedoed the ram *Albermarle;* Decatur, hero of the Tripolitan War and victor of the *United States-Macedonian* fight; Farragut, our greatest sea fighter; Hull, victor of the *Constitution-Guerriere* duel; and Worden, commander of the *Monitor* in its fight with the *Merrimac.*

There are also on the walls a fine collection of Washingtoniana and the vigorous paintings of Gribble of the American destroyers in the World War. The windows overlook Farragut Field, the drill and football grounds, with the harbor and bay in the background. In the foreground, on the terraces, are the figureheads of the U. S. S. *Trenton, Macedonian, Franklin,* and *Constitution.* On the floor below is 'Smoke Hall,' the recreation room of the dormitories. Below this is the huge mess hall and kitchen, where the 2,500 lads are fed at a clip.

Adjoining Bancroft Hall is the gymnasium, Macdonough Hall, named for the victor of the battle of Plattsburg on Lake Champlain in the War of 1812. As reminders of the victory two 24-pounders, taken from the British flagship *Confiance,* flank the entrance. One of the cannon has a dent on the muzzle made by a ball which caused the piece to recoil and kill the British commander, Downie.

The other building is Luce Hall. It is named after Rear Admiral Stephen B. Luce, founder of the War College at Newport, Rhode Island. It, too, has its collection of relics and trophies, including the raft used by Hobson in the perilous expedition that brought him fame—the sinking of the *Merrimac* in the entrance of Santiago Harbor in an attempt to bottle up the Spanish fleet.

At the waterfront lies the famous old yacht *America,* presented to the Naval Academy by a group of American yachtsmen. The *America* on August 22, 1851, won at Cowes, England, the international race and thus brought to this country the trophy ever since known as the America's Cup.

Probably the most interesting monument in the Academy grounds is the Tripoli Monument. It is the work of the Italian sculptor Micali, and was designed as a tribute of brother officers to the midshipmen—Somers, Caldwell, Decatur, Wadsworth, Dorsey, and Israel—who lost their lives during the Tripolitan War.

# Poland—Country of Possibilities

## New Angles on a Reborn Nation Rich in Natural and Spiritual Resources

By WILLIAM M. PATCH

THE writer recently dined with a prominent New York banker and had the pleasure of sitting next to his wife. The conversation, leading from one point to another, finally drifted to Poland. The writer informed his hostess that he was planning to go to Europe in the near future and while there, to visit Poland. Whereupon she exclaimed:

'Poland? Why, I didn't know anybody lived there!'

The writer then timidly asked: 'Do you really know where Poland is?'

Alas and alack! This charming and otherwise intelligent American lady didn't know where Poland was. She read once upon a time somewhere that Poland was a part of Russia. To the best of her knowledge and belief she still thought—if a vague feeling may be called thinking—that Poland was located somewhere in Russia, or at least in that general section of Eastern Europe. She was surprised to learn, as the conversation proceeded, that white people lived in Poland; that its cities were among the most beautiful in Europe and some of them centers of learning for many generations before the establishment of 'fair Harvard'; its culture centuries old and its resources such as to make the country self-sustaining.

The knowledge of thousands of otherwise intelligent Americans on the subject of Poland and the Polish people is as deficient as that of this charming hostess. Yet the history of Poland extends back for a thousand years. Within that period Poland, on many occasions, occupied a position second to none on the continent of Europe; her territory extended from sea to sea and her power and influence even further. Polish cities attracted merchants, and Polish educational centers—notably the Jagiellonian University of Krakow—attracted scholars from all over the then known world. Polish soldiers went wherever their duty called them, in defence either of their own country or of Christian civilization.

Everyone has read about Jan Sobieski and his winged knights, who routed the Turks at Vienna. The cause of liberty, even from across the seas, appealed to the valiant Polish soldiers. Who has not heard of Pulaski, who made his supreme sacrifice at Savannah on behalf of our independence? Or of Thaddeus Kosciuszko, hero of two continents, who fortified the battlefield of Saratoga and the Heights of West Point and who contributed no small share to the siege of Yorktown? Yes, the Poles have a past not to be ashamed of. But it is of the present that the writer intends to speak.

For a century and a quarter prior to the World War, Poland was divided among the three partitioning powers—Russia, Germany and Austria. In this war (1914-1918) the Poles were arrayed brother against brother and were made to fight for all three oppressors; a prospect which meant everything to lose and nothing to gain. Whichever side won, the Poles were bound to lose. But it came to pass that all three oppressors lost out one by one, and Poland won.

Revised map of Poland, including Vilna and neighboring territory

In 1918, Poland was again a free nation, and her independence was recognized not only by the Treaty of Versailles but by the whole civilized world.

With political independence came the problem of setting up her national housekeeping on the ruins of the war and out of the remnants of material made to fit the schemes of other households. It was a stupendous problem. She had practically nothing to start on and every obstacle in the way of getting started. Her neighbors had a more or less unified administration in the shape of a corps of trained officials, capable of thinking in terms of national needs. They also possessed police, a system of transportation and communication, capital and some sort of a monetary system. Poland had none of these things. Her territory was ravaged by every invading and retreating foe and everything in sight was destroyed or carried away.

Competent authorities unite in saying that Poland's plight was even worse than that of Belgium. For whereas Belgium was invaded by one army, Poland was invaded by four. The destructive howitzers and the efficient troops of Germany, as well as those of Austria, Russia, and later the Bolsheviki, all had their turn. They burned, pillaged, destroyed and laid waste almost every section of the land. To all of which was added general antipathy to any kind of government and unwillingness on the part of the masses to pay taxes—exactly the sort of thing we Americans inherited from our Revolutionary days. Domination, to say nothing of oppression, does not foster civic virtue.

But there are resources that neither age-long oppression can destroy nor hostile armies carry away—the natural resources of the Polish land and the spiritual resources of the Polish people. We see here a vast territory, comprising an area of 150,000 square miles and a population of 30,000,000. Taking Great Britain into consideration, Poland is the sixth largest country in Europe from the point of view of both territory and population. The first five are Russia (about 100 million), Germany (58 million), Great Britain (47 million), France (39 million), and Italy (36 million).

Poland's chief industry is agriculture: no less than two-thirds of her population earn their living by the cultivation of the soil. At present the chief agricultural products are rye, oats, wheat, barley, potatoes and sugar beets. Due, unfortunately, to unfavorable economic conditions which have hindered the development of agriculture ever since the re-establishment of the Republic and which made the export of Polish agricultural produce very difficult, Poland has not attained that important position in the world markets which it rightly deserves. Yet Poland stands second in the production of potatoes, third in barley and oats, and fourth in beet sugar. With regard to livestock, she is preceded only by Germany in the production of horses and hogs.

Timber forms one of the most important items in Polish production. The area occupied by woods and forests comprises about twenty-three per cent of the total. Although forests are not being exploited on a large scale, the production of timber, besides satisfying the needs of the country, leaves a comfortable margin of 8 to 10 million cubic meters for export annually. The value of timber exported in 1924 amounted to 150,000,000 *zlotys*, and it doubled that of 1922. The exports of timber are growing and their importance for the Polish trade balance is correspondingly increasing. The quality of some of

the Polish timber is beyond competition, especially Volhynion oak and Eastern Polish pine. Germany, for raw materials, and England, for half-finished products, constitute the chief markets. So far only small quantities have been sent to the United States.

Poland has also salt, petroleum and coal resources. The Silesia-Moravia-Krakow coal basin is one of the richest in existence. The products of Wieliczka salt mines are considered the best in Europe. Recently large strata of potassium salts were discovered.

But above all, reborn Poland possesses the spiritual resources of the Poles—their rich traditions, their patriotism, their capacity for hard work and boundless courage. Forces such as these are no less powerful than material forces. With these resources Poland, within the few years following the Armistice, has organized her administrative machinery, her police system, her educational system, her system of transportation and communication. Economically, she has developed her productive capacity to a normal pre-war level along many lines and exceeded it along others. She has reformed her currency and placed it on a gold basis; has balanced her budget and achieved in recent months a favorable balance of trade and established for herself an international credit.

All who have been in Poland recently report that in the face of almost insurmountable difficulties the country has made remarkable progress; probably greater than that of any other country under like conditions.

All this has been made possible because of the boundless capacity for work the Pole possesses. And when I say the Pole, I mean the real Pole, the Christian Pole. Hard work has solved the Polish problem—at least for the Poles. The Pole works from early morn till late night; and as he works he sings unceasingly, for he feels happy.

Whatever else Poland lacked at the start, she has this great productive capacity of her peasants and workingmen as a foundation upon which to build.

In an industrial age like ours, four factors are indispensable to a progressive national economy: natural resources (land, forests, minerals, water, desirable climatic conditions, etc.); strong hands willing to work; capital (especially in the form of equipment and tools); and an organizing or directive genius. Poland has great abundance of the first two, but lacks to a large extent the third and fourth.

In the course of time she can accumulate her capital and produce her own organizer of industry, the *entrepreneur*, the man, as we learn in our elementary principles of economics, who takes the factors of production (land, labor and capital) and organizes them in the most effective way. But her economic progress would be greatly accelerated by the infusion of large doses of capital from countries that are better off in this respect.

Among the needs of Poland today are substantial credits from abroad and the business brains to administer them properly. Why not American credits? Why not American brains? America has plenty of both. Poland has done wonders already along lines of economic reconstruction, and has demonstrated her ability and her capacity. She has proved that she may be trusted.

Anti-'Red' elements have lately been steadily gaining the upper hand at Canton, China, with the result that elements among the civil population who are always ready to back the winning side have now become definitely Anti-Bolshevist. It is maintained, and it appears with considerable justice, that had the Powers intervened in the Canton situation these elements would have immediately become pro-Chinese, regardless of whether Canton was 'Red' or 'White.'

The successes of Chang and Wu, although they may act as a severe setback to Russian and Bolshevist intrigues, cannot, however, be looked upon yet in the light of a settlement of the Chinese Civil War. The various warring generals, who are temporarily allied against a common enemy, have yet to settle their mutual differences.

---

the origin of the law against gambling had nothing to do with anything so visionary as morals. It was purely a matter of worldly wisdom. The governors of England one day announced that citizens had been found playing at (to quote the statute of 33 Henry VIII, c. 9) 'many and sundry new and crafty games and plays, as logetting in the fields, slide-thrift, otherwise called shove-groat . . . keeping houses, plays and alleys for the maintenance thereof.' Then followed the objection to all this, which had nothing to do with ethics; gambling was wrong solely because 'by reason whereof archery is sore decayed . . . and divers bowyers and fletchers for lack of work gone and inhabit themselves in Scotland and other places out of this realm . . . to the great comfort of estrangers and detriment of this realm.' Therefore these houses and games were declared unlawful.

That is, certain games were made crimes in England, not because they were considered morally wrong, but for the very materialist reason that if men and boys sat about playing shove-groat they were not practising with bows and arrows, and so getting ready for the next war. It would be a difficult matter for the modern Puritan to decide whether, on the whole, it is not a more moral thing to play pitch and toss than to learn to kill one's fellowmen. Anyhow, such is the foundation of the legal crime of gambling—it stopped archery practice!

---

the fact that birds sing after the breeding time is over shows clearly enough that love is not the only well-spring from which their song arises; what these other emotions may be is bound to be largely a matter of supposition. Besides weather conditions and a plentiful supply of food, alarm is a powerful song stimulus. I once saw a kestrel stoop at a skylark: the hawk missed its quarry by a fraction of an inch; immediately the skylark soared up and burst into full song. A fisherman friend once saw a hawk attack a dipper, which fell, partly stunned, into the water. He scared off the hawk, and the dipper floated downstream till it came to a stone, when it crawled out, gradually recovered, and finally broke into music. It is, of course, possible that the stimulus in both these cases may have been relief from danger. Birds which are good singers are volatile in temperament, and therefore likely to be easily influenced by environment—in fact, to possess in some measure the esthetic sense; hence they respond readily in song to any stimulus, pleasurable or otherwise. A stone thrown into a reed-bed makes all the sedge and reed warblers hysterical—'when the little heart is big, a little sets it off.'

actions in response to light are called 'phototropisms'; where they are caused by the direct influence of the sun's rays they are known as 'heliotropisms.' These actions are compulsory; the animal under the influence of a tropism acts mechanically, but when once the action is accomplished the tropism weakens, or probably other stimuli prove stronger. Certain animals which are said to be attracted by curiosity to light—a fact which has been made use of in many instances to bring about their destruction—are thus proved to be under the influence of positive phototropism. The attraction of light for moths is very well known, and anyone who has lived in a neighborhood where glowworms are abundant must have been distressed by the reckless manner in which the winged males in the breeding season will commit suicide in candles and lamps. The reason for this attraction is obvious, thanks to Loeb's experiments; the unfortunate males develop a strong phototropism for the purpose of being guided thereby to the light which the female exhibits, and he is automatically drawn away from his mate to be destroyed by her more powerful rivals.

---

Peking's poverty and misery grow apace, says the *North China News*. There has been a veritable epidemic of suicides in recent weeks and dog-eating is becoming so increasingly common that all dogs of worth are kept off the streets and are guarded by their owners. A recent season of mild weather was followed by a few cold nights during which the police found many dead men, women and children in all quarters of the city—dead from weakness and physical exhaustion.

# 'Are You an Optimist?'

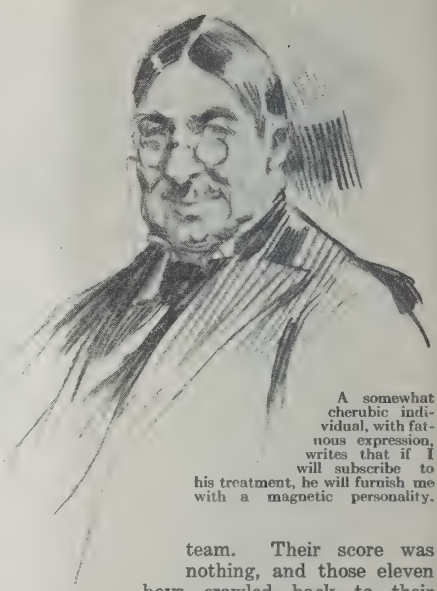
(Continued from page 7)

I have known a number of success manufacturers. They were all poor, and one 'worried stiff most of the time.'

will furnish me with a magnetic personality, complete in all parts. But what would I really do with a magnetic personality? Indeed it is getting to be so that if you have any personality at all, you are in danger. I have been getting rid of mine for years and it is the only real road to happiness that I know.

Yes, these people are sincere. They believe in *achievement*, in *concentration*, in *realization*, in *dominion*. And they are so unselfish that they don't bother to get these things for themselves; they wish it all for you and me.

This does not mean for one moment, however, that they are all unsuccessful. On the contrary, just as I have stated about the lady psychologist who took ten thousand dollars out of my neighbors, so I know one large concern whose annual profits run into hundreds of thousands of dollars, and it is all supported by voluntary contributions.

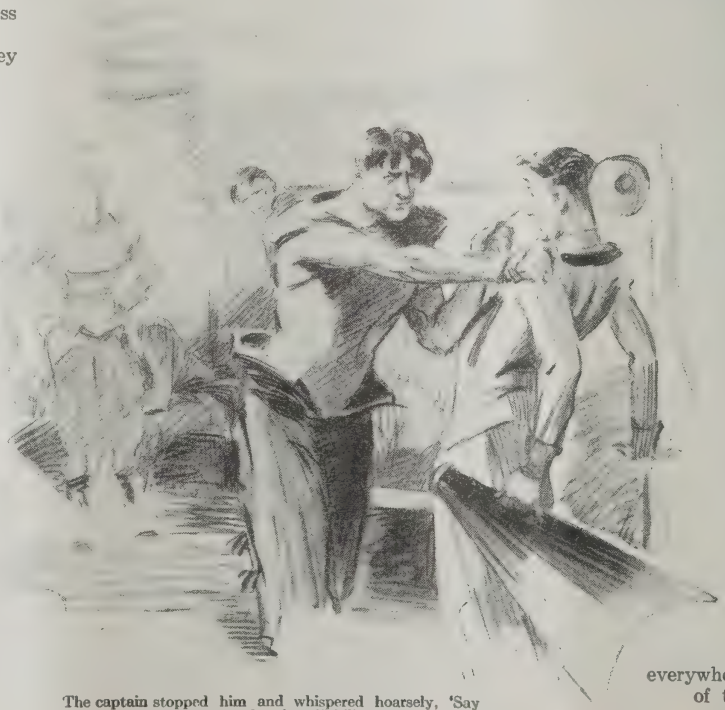


You send them what you want to. This method is such an easy way of making large profits that it is worth while to analyze it for a moment.

If you are feeling depressed over some turn in your affairs, and have been quite possibly brooding over it, and a friend comes along and slaps you on the back, tells you a cheerful story and flatters you by saying that you have all kinds of ability, what happens? For the moment, at least, or for a much longer time, you are jarred out of your morbid mood. You experience a sense of relief. You suddenly realize that you had become twisted up mentally and that most of it was just such stuff as nightmares are made of. You are grateful to your friend. I know several men who make a fine living just by being cheerful. They are provided with meals just because the providers like to have them around.

Now if you will apply this simple principle to our inspirational friends, you will see how it works. A man I know told me he had been trying to sell his house. He wired the inspiration plant for help. The next day a man came around and bought the house. He thought the I. P. had done it and voluntarily sent them a large check. After all, human beings are not all pikers. But in this instance, mark the sequel, for I know the man. He is a mediocrity. He has tried for many years to 'get good' as they say. Why has he not succeeded? Because he is looking for outside inspiration.

We know, if we know anything, that this country was first settled by men and women who depended entirely upon themselves. Fancy William Bradford, the original John Smith, Cotton Mather, or any other Pilgrim or Puritan leader, taking a correspondence school for *success* before they sailed from England, in order to have magnetic personalities enough to fight Indians! Also, we know that we have been running along for some years on the original courage and initiative of those same early settlers. That we have it still is shown by the following incident:



You know what a cheer leader is? Well, a certain university football team was badly defeated by another university football team. Their score was nothing, and those eleven boys crawled back to their quarters dripping with gloom. While they were changing, the cheer leader came in, and jumping up and down as a preliminary, and putting on a cheer leader's grin, shouted: 'Now fellows, all together!' The captain of the team stopped him. Going over to where the cheer leader was beginning to cheer, he crushed him down and whispered hoarsely: 'Say another word and we'll kill you!'

A somewhat cherubic individual, with fatuous expression, writes that if I will subscribe to his treatment, he will furnish me with a magnetic personality.

That is the real thing, because it is based on the big idea that when we get licked, we are not going to spare ourselves anything that will teach us not to get licked again. What the inspirational people are trying to do is to offer to spare us everything, at a price.

But that is not all. A proportion of them, who appeal to our intelligence instead of to our emotions, suavely tell us that if we will follow their lead, they will teach us how to think. The fine art of thinking has been played up now in every conceivable form. It is first assumed—although this of course is put in a very gentle manner—that the whole American public is a mass of morons, or more vulgarly, stupid asses, and that it never thinks at all. Now the truth is that there has never before been gathered together on this globe so many people with such a high standard of intelligence. This does not appear on the surface, quite possibly, but the signs of it are everywhere. For example, one of the leading landscape artists of this country,

The captain stopped him and whispered hoarsely, 'Say another word and we'll kill you.'

a man who has studied abroad for years and whose pictures command the very highest prices ranging up into the thousands, told me only the other day that there was better art being created in this country than any other country in the world. The same thing is true in inventiveness, in architecture, in music and even in religion.

If you doubt that the American people think, talk to the first man you meet on a subject in which he is interested. He will tell you all about it in a minute and he will tell you straight. He will, quite naturally and properly, be a dumbbell on a subject in which he is not interested. It is just here that so many wise crackers are fooled.

Our fault lies precisely here: we think so easily, we are so quick on the trigger, and we have developed such enormous natural resources, that we get mentally lazy, or soft, and believe we can pay for something that will get us ease in living, just as we get gas from a station. The only trouble is, when you get your inspiration from the outside, your engine goes dead on you if they turn off the supply.

Please note further, *there is no such thing as new thought*, and what all the inspiration and success and new thought folks are trying to sell us has nothing to do with real religion. That is quite plain enough to the simplest mind, because, frankly, they are interested in securing your success in this world, and not in the next. It is all personal, material, immediate; from the inflation of your will power to the adjustment upon you of a magnetic personality, it means earthly harmony, earthly dividends. And the new thought is as old as the hills. They had correspondence schools in Babylon on the development of your inner cadences, but they said it with bricks instead of pink circulars.

Are you an optimist? It is a matter of temperament. Your temperament is something that comes with YOU. You cannot trade it off for another. It sticks by you through life. If it is the temperament of an optimist, then you are an optimist, and—if you don't get too cheerful—people will ask you to eat up their good food. If you have the temperament of a pessimist, you may, under pressure, try to conceal it, but you will always be one.

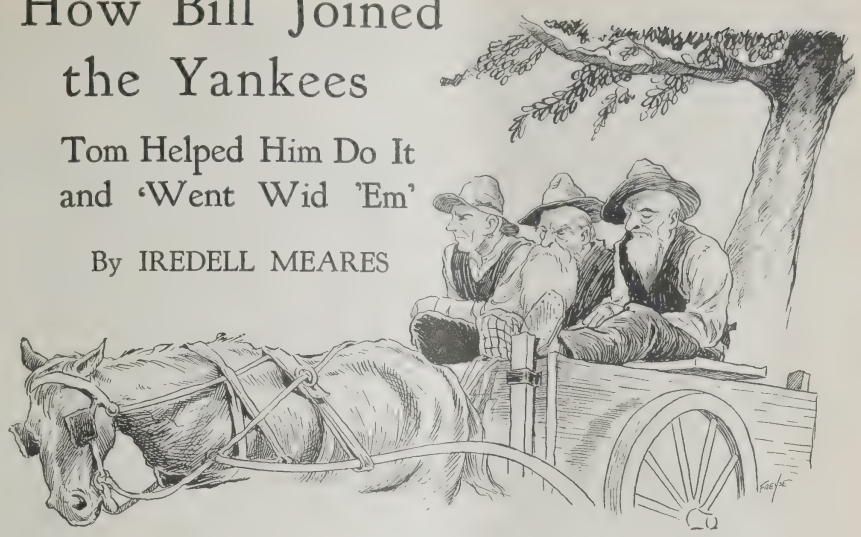
## The Last Laugh

OVER a slowly burning, well concealed mosquito camp fire in Arizona, I have contemplated the patriarchal and convincing features of Joaquin Miller, and listened to real music, as the soft, undulating voice rolled out the warranted embellishments of a personal narrative.

I suggested: 'Miller, tell us tonight what kind of a scrape you had been in when you wrote in your *Sierra Nevada:*

'I would some things I've done and said,
Were dead
Well dead
And buried deep as hell
With recollection dead as well
And as for resurrection,
God forbid.'

Those forceful blue eyes, with closing lids, acquired only by those who have lived where they shoot first and then find out their mistake, looked earnestly at me. With a touch of asperity in that entrancing voice, he said:



'You tell us what kind of a scrape you had been in that led you to memorize that paragraph, and quote it so feelingly.'

—*By One Who Knew Him.*

# How Bill Joined the Yankees

## Tom Helped Him Do It and 'Went Wid 'Em'

By IREDELL MEARES

THREE old cronies lived in North Carolina. Each had a five-acre farm and a log cabin. Their farms adjoined. Together they owned a two-wheeled cart and an old gray mare.

Bill and John had a fight. Tom was the only witness. John in the mêlée bit off a small piece of Bill's ear. Bill brought suit for mayhem—personal injury.

'We bin to town,' said Tom, the sole witness, 'and hear'n de speakin' we started back in de car. I had de reins driving de old mare. Bill, he sot on de right oner me on de seat. John, he sot on tother side. Me was in de middle. Bill and John dey was argufying about politics. I keeps on drivin', payin' no attention much kase dey didn't know nuttin' about what dey was talkin' and fussin' about no ways. Torectly John, he 'lowed, he was gwine to take offen his coat to it.'

Now, in local parlance, that meant he would back up what he said by fighting about it. It is a challenge.

'Bill,' continued the witness, 'when John said dat, Bill he jist gits offen de cart and pulls off hisen coat. John he done de same. Den de fight started.'

'What did they say, either of them?'

'Nuttin' what I hearn.'

'Were they mad—did they get mad?'

'Nope.'

'Did they use any angry words?'

'Nope.

'How long did they fight?'

''Bout a bit.'

'Anybody get hurt?'

'Bill he git a piece of his ears clipped.'

'Who did it?'

'John.'

'What did they do when they quit fighting?'

'Gits in de cart and I drove on.'

'And nobody said anything till you got home?'

'Nope and not when we gits home nudder.'

'Bill complained about his ear, didn't he?'

'He jist grouched about it kase hit was bleedin'.'

'How long have you known the plaintiff, Bill?'

'Pretty nigh all me life.'

'Do you know his general character?'

'Yep.'

'What is it?'

'Wa'al, it's pretty good, except for not speaking.'

'Not speaking, what do you mean?'

'Wa'al, tother day he passed me on de road and he nebber speak. He gits dat away sometimes—in a sorter grouch.'

'Well, you were in the Confederate Army—same company with Bill, weren't you?'

'Yep.'

'Bill was wounded?'

'Yep.'

'You brought him home?'

'Yep.'

'On furloughs, I suppose?'

'Yep.'

'You say, you were in the army with Bill, he was wounded and you brought him home on furloughs?'

'Yep.'

'Where was Bill wounded?'

'Sorter here (placing hand a little front of side).'

'Put your hand on the spot.'

'Sorter here (moving his hand little back of side).'

'Oh—put your hand on the exact spot. You can do it.'

'Wa'al, here it be (placing his hand on his back next to spine).'

'Then Bill was wounded in back?'

'Yep.'

'Was he running, back to Yankees?'

'Wa'al, I guess so; none of us be walkin' that day.'

'Well, Bill got well?'

'Yep.'

'Did he go back, or either of you, after your furloughs expired?'

'Nope.'

'Did the provost marshal get after you to send you back?'

'Yep.'

'Did he get either of you?'

'Nope.'

'Why not?'

'Kase he didn't.'

'Now, as a matter of fact, don't you know that Bill, the plaintiff, after he got well, ran away, deserted and joined the Yankees?'

'Yep.'

'Take the witness, gentlemen.' Whereupon plaintiff's attorney, chagrined at the disclosure, turned upon the witness, and, in sarcastic tone, angrily asked:

'And, pray tell us, how do you know that the plaintiff deserted and joined the Yankees?'

'*Kase I hoped him do it. I went wid 'em.*'

Plaintiff did not recover.

# Chats with Office Callers

'They say Germany is busted,' said ***the man from the South,*** 'but she is today shipping nitrogen products into the United States. Before the war Germany was importing from 700,000 to 800,000 tons of Chilean nitrate annually. Now, by the use of her war-built plants (like our Muscle Shoals) she is not only supplying her domestic needs but is selling her surplus to the United States. Funny, isn't it? Take the dye situation. Before the war we were dependent largely on Germany for our dyes. Then came the war and stoppage of importations. Germany had taken out patents on dye manufacture in the United States but she had purposely left gaps in the formulas. Without the missing links we were helpless. Later on a manufacturer imported two skilled German dye workers who filled in the missing portions of the formulas and we are today independent of the German supply. It takes a crisis to bring results in the United States, but no crisis seems sufficient to call the United States to free the farmers of the country from their dependence on Chile for nitrates. Resting over every acre of our land, in the atmosphere, are 33,800 tons of nitrogen. And yet with processes for fixing the nitrogen of the atmosphere commercially we dawdle along at Washington and seem to suffer no humiliation of national pride that Germany is shipping us air nitrogen fertilizer. Meantime, eight years after the war, one of the largest air nitrogen plants in the world, built by the Government at Muscle Shoals during the war, remains idle and the only thing at work at our air nitrogen plant at Muscle Shoals is rust.'

❦ ❦ ❦

'It is difficult to believe,' said ***the man from New Zealand,*** 'but there are settlers and even townships beyond the reach of wheels in New Zealand. The inhabitants use saddle-hack and pack horse for transport. The Maori horses are tough little beasts, ill shaped and hard mouthed. But they can carry a heavy load without halting. I've had them go thirty or forty miles a day over rough hill country, carrying a good load. Pedestrians are rare in the back country of the islands. Even the native rides. Tourists in New Zealand too often see only the show places. There are innumerable side trips to be made off the beaten path where the tripper will find new scenery and much hospitality. The whites in the more isolated portions of the islands welcome the traveler, for it is seldom they see a strange face.'

❦ ❦ ❦

'About as serious a piece of work as I have recently seen,' said ***the man with a sociology bent,*** 'is the work of an American priest of Irish extraction who is in charge of an Hungarian parish. Finding his parish filling up with Hungarians, he decided first to understand them. But in doing so he would not concede them everything. He mixed the English language—50-50, as we say—with his parishioners' native language. Then he set about to find how best they could be fitted into their new American life. He studied their pedigrees, their family histories. He found out from what racial branches they had sprung, what was their background. He obtained data concerning their relatives in Europe. Then, armed with 2,000 names and addresses, he went to Hungary and studied the background, both racial and physical, from which his parish had sprung. He now feels as if he knew a little more about his people. The Hungarians, you know, are really fine people. It is rarely if ever you see their name connected with the alien crime wave that has swept over the country. The Hungarian communities are industrious and peaceable.'

❦ ❦ ❦

***A Yakima Indian*** came into The Office and added to our information by saying that the famous Yakima apples and other Yakima fruits are raised on the reservation of his tribe. But the raising is done by the white farmer on lands leased from the Indian. 'We have a saying on our reservation,' he said, 'that "most of the best eighties are married off." Worthless white men marry our girls to get the land, and then skip out. The Government is putting a stop to that, however. I do not join in the Indians' complaint against the Indian Bureau; we are not in any position to indulge in criticism yet. But I sometimes think the Government's educational policy is narrow. Our people are artists, as you know, yet no provision is made for music or art in the studies offered our children. I know a Hopi Indian boy who is a master of color, but nothing can be done for him; not a dollar can be found to use in his development. It seems a great pity. There were 12,000 of us Indians who enlisted for the defense of the country in the World War, but when we were mustered out we had to go back as wards of the Indian Agent. In seventy-five years the Indian will be landless, and it depends on the educational policy now pursued whether he shall then take his place in society or become a gypsy race. Individually the Indian does well where he has a chance, but tribally we do very poorly.'

❦ ❦ ❦

'I see you had a reference in your paper to the expression "Keep your shirt on,"' said ***the Friendly Reader.*** 'Your author explained it passably but not accurately. The origin of the matter goes back pretty far—back to the time when they say that our forefathers were savages. Of course, that is untrue. We of Anglo-Saxon origin were civilized when Rome was a wilderness. The ancient Briton was thought a barbarian because he stripped for battle. Every British schoolboy, every British sailor does the same today. You see the dockmen stripped for action. The Anglo-Saxon soldier in battle has an irresistible propensity to get rid of every incumbrance that hinders his hardest blows. This was so foreign to what the Romans did that they thought the Britons barbarous. Indeed, in no other race will you find the propensity to strip for action. Taking off the shirt is, therefore, the sign of battle. It is a deep-rooted instinct in our people. Thus, when reference to this habit crops up in modern slang the expression "Keep your shirt on," it simply means, keep your fighting temper down.'

❦ ❦ ❦

'I was riding in the diner between Pittsburgh and Washington,' said ***the Man from Washington,*** 'when Andrew Mellon, Secretary of the Treasury of the United States, rose and left a table.

'"Do you know who that was?" I asked the negro waiter.

'"Ah sure do: that's Uncle Andy Mellon of Pittsburgh."

'"You see him often then, I take it."

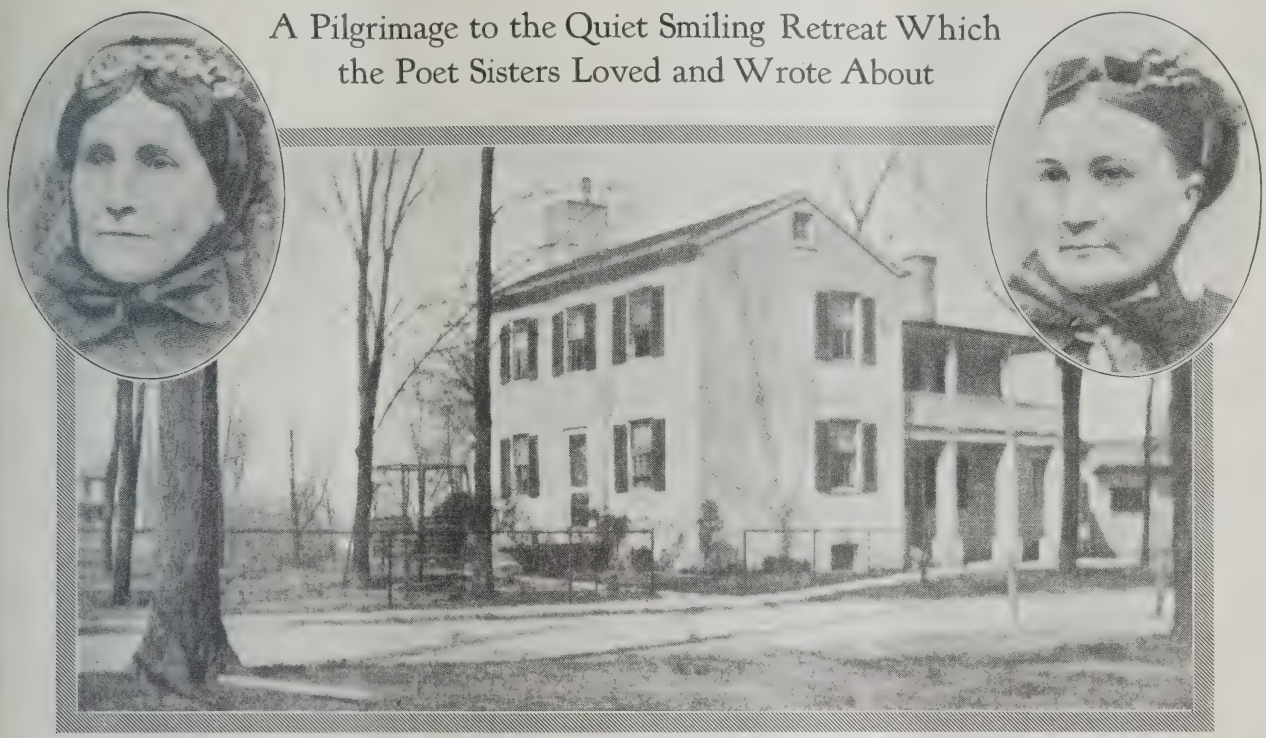
'"Oh, yes sah, yes sah. He always comes in about this time for some crackers and milk, and then about eight o'clock along he comes for his dinnah."

'"Pretty liberal tipper?"

'"Oh, yes sah: las' time he give me $1.75. But the real tipper is Harry Thaw. He's a Pittsburgh man too, just like Mistah Mellon. Yes, sah, Mistah Mellon and Mistah Thaw both Pittsburgh men. Pittsburgh's a great town. Lots o' big men there. Mistah Thaw he tips everybody, even the steward.

'"But things ain't as good as they were," continued the waiter. "The rich people don't travel like they used to."

'"Don't travel?" I said.



'"No, sah, they all go in motor cars now."'

❦ ❦ ❦

The conversation centered on those recent books of fiction which picture American farm life as drab and foul and depraved. 'The chief fault with our callow young realists,' remarked ***The Newspaperman,*** 'is that they are trying to raise up a peasant class in American literature whereas there is none on the American land. Because Russia has a peasantry, our young literary lights think that America should have a peasantry too. So they invent an American peasantry in their novels. They have failed to comprehend that America is not Russia, nor are Americans Russians. The difference is a matter of race. *The American is not a peasant, he never has been, and he never will be.* He comes from the yeomanry and thanehood. The peasant type of other countries is quite recognizable, but even the literary industry of our New York youngsters has not produced anything like an American type on paper. The reason is that it does not exist in life. One poet like Robert Frost, who truly understands and sympathizes with and interprets the American farmer, or one writer like David Grayson, is worth a thousand of the self-styled "realists," who, failing to Russianize American life, want to Russianize American fiction.'

# Clovernook, the Cary Homestead

## A Pilgrimage to the Quiet Smiling Retreat Which the Poet Sisters Loved and Wrote About

Clovernook, the Cary homestead at Cincinnati, Ohio. Oval (left)—Alice Cary. Oval (right)—Phoebe Cary.

By FRANCES HIGGINS

'OF COURSE you will want to see Clovernook, the Cary homestead,' we say in planning the itinerary for our guests at Heighholme. It is more a habit than a suggestion. The tone of voice is that used in Washington in referring to Mt. Vernon; half reverence, half nonchalance from much repeating.

'Clovernook? The Cary homestead?'

'Yes, the old home of the poets, Alice and Phoebe Cary,' we explain, with what we deem a proper inflection in pride and voice, knowing it to be our city's, our county's chief literary shrine.

A reply in the affirmative—and it is invariably—arrangements are made and we are on our way. Blessed is the day when our guests prefer to walk and we may venture forth in true pilgrim fashion from one Ohio hilltop to another. Thus journeying, by winding country lanes instead of the much-vaunted auto highways, we circumvent the farthest confines of the city and more nearly approach the age and atmosphere we seek. Yes, blessed is the day and the pilgrimage and the guest who inspires it!

There is a charm in the smiling, intimate landscape that instantly transports us to the days when the poet sisters loved and wrote of it. With the exception of huge cylindrical silos, modern woven-wire fences, and roadside telephone lines, it is the country of their books and poems still—a homely yet lovable country that does not swallow up the modest farmhouses, barns, and haystacks as a vaster scenery does, but seems rather to enfold them.

'Woods and cornfields, a little brown,' such as the sisters knew, alternate along our twisting thread of road. That is, if it be September, the most delectable time of all for our pilgrimage.

The woods may be somewhat less extensive and less frequent now, but none the less enchanting with their dim aisles marked by native growth of oak, elm, beech, maple, locust, sycamore, and buckeye, and carpeted by myriad native flowers. Here and there, along the margin of a stream—creek is the proper word, no doubt—reigns a monarch of the beeches or such an elm as might have served as model for Corot.

The corn, most majestic of all cultivated crops, thrives as in a virgin soil and would inspire a poet still, if such there were among our company. Gay, rosy tangles of morning-glories cling to its ripening stalks; goldenrod and blossoming artichokes touch the fence-rows with color; tall, graceful ironweeds purple the hillsides above like heather.

Setting our pace to the moods of our company, we come at last to the ancient water mill—now converted to steam and grinding rhythmically—near the head of Mill Creek. It may be the very structure to which Robert Cary, father of the poets, brought his grist a century and more ago. The thought remains while we turn from our pleasant country way on to the smooth stretches of the Cincinnati-Hamilton Pike, which brings us promptly to the site of the first Clovernook.

A venerable snag of a tree well hidden by a rank growth of wild grapevine is all that marks the spot where once the wee house stood. But pausing there before it we seem to see the veritable story-book dwelling, of which Alice Cary wrote:

> Low and little, and black and old,
> With children many as it can hold.

Nor is this mirage to be wondered at. Few houses in all the country have been so honored as this most humble dwelling which Robert Cary built with his own hands in the pioneer days of 1814. It is referred to again and again, immortalized, in the verse of the talented sisters—Alice, born beneath its roof in 1820, and Phoebe whose centenary was celebrated two years ago.

It had no rival in the hearts and verse of the Cary family, though it came in time to have a successor, a second Clovernook. The neat gray brick farmhouse, standing close beside the road a few rods south of the site of the original dwelling and likewise facing west, inherited its name and at least the shadow of its fame.

Robert Cary, thrifty farmer that he was, lifted the last cent of indebtedness from his farm after nearly twenty years of hard and patient labor. It was then, in the early thirties, when Alice was twelve years old and little Phoebe only eight, that he was enabled to provide a larger, better home for his rapidly growing family.

Not that the wee, brown house was not very fine in its way, It was frame and a whole story and a half in height, while many a neighbor boasted no more than a rude log cabin in those days. But Robert Cary could now afford to build a much more commodious home, and he prepared to do so, making the bricks from the bank of glacial clay in his own fields. That it was a busy, happy time for the little family, watching the molding and baking of the bricks, cooking for the laborers and the masons, washing dishes, we may be sure.

However, we may better judge their pride and satisfaction in it by inspecting the house itself, the object of our journey. We turn from the brick-paved highway where automobiles and traction cars are making their noisy way from city to city and enter the grounds of Clovernook. We approach not the neat gray farmhouse that might have been borrowed from a New England landscape, but the large, modern brick building on its right.

Clovernook is now the property of the Cincinnati Association for the Blind. The administrative offices are in the new building. It is here we make known our request.

'Certainly you may see the buildings. Wait here in the living room until I send for some one to take you through,' says the matron.

We obey, admiring the pleasant living room whose inmates may not see its charms but are none the less aware of them. We turn from quaint chairs and tables in the antique style to the piano and the phonograph and the radio of the present day. It is the library, however, that proves most interesting, shelves of immense volumes, the Bible in Braille and New York point, and a few other books. *Mother Cary's Chickens* is one of them; the very brief story fills two volumes! The Bible fills two shelves; we shall have to count.

*The Rosewood Desk With the Indian Shawls*

But here our guide, who is an inmate of the home, enters, calls our attention to the features of the sunny living room, which she has never seen, and to the still brighter solarium beyond the French doors. She directs us to the guest book on the old mahogany table, asking that we register. We write our names on the page for the day, adding to a list both long and varied.

She leads the way to the office across the hall. The quaint furniture of the living room does not belong to the Cary régime, being merely the gift of friends of the association, as she has patiently explained. But here before us are the real treasures of Clovernook—the Cary desk and the Cary table.

It is hardly Alice's rosewood desk that held the famous collection of India shawls in the New York home, nor Phoebe's which was an exact counterpart, but it is a very lovely desk, a camouflaged chest of drawers, when closed, and it actually belonged to the sisters or their family. We like to think of it as belonging to that happy pre-New York period when Robert Cary moved with his wife (a second one and not overly sympathetic, as our guide explains) to still another home, leaving Clovernook to the sisters and to peace.

Perhaps it is the desk that witnessed the preparation of the first small volume of 1849, that shared the full delight of assembling and arranging the best of ten years' unpaid labor, hitherto published in the Boston *Laaies' Repository*, in *Graham's Magazine*, in the *National Era*, and in the dailies and weeklies of the age, to be set before the world as the *Poems by Alice and Phoebe Cary*. If so, dear desk! There was never another hundred dollars like that first—from the Philadelphia publishers—we know.

It may be that these pigeonholes—they are still in daily use—once held the treasured letter of appreciation from Whittier, or correspondence equally complimentary from the far-famed Greeley, who came to visit the sisters in their western home, falling into lifelong friendship. The happy thoughts linger while we follow our guide to the guest room above for a view of the mahogany four-poster lately rescued from the old gray Cary barn; they accompany us across the graveled driveway to the door of the shrine, Clovernook.

*Where the Family Gathered About the Hearth*

The parlor—it is a parlor still where the inmates of the home receive and entertain their guests—seems smaller than we had expected. It is low-ceilinged, quaint, papered in a small-flowered design that suggests a former day. It is not difficult to see honest Robert Cary and his family assembled about the hearth, nor to picture their pride in the room. The beginning of all good things, the Carys deemed their fine new home. But it was not to be. Did they, we wonder, when their short years of happiness had passed and a stepmother ruled at Clovernook, give up sitting in the pretty parlor and only look in sadly, longingly?

'The portrait, the gentleman, above the mantel is Mr. Proctor, who bought Clovernook and presented it to the Blind Association,' says our guide, breaking in upon our reverie.

'The oval portraits above the organ are the poets, Alice on the right, Phoebe on the left.' We pause before the portraits. These are not the Alice and the Phoebe Cary of the trying, formative Clovernook days, when friends were all too few and fame undreamed of. They are, we judge, the mature poets, whose names were household words, whose 20th Street drawing-room was the center of the New York literary world. Alice, the author of one of the most musically perfect lyrics in the English language! Phoebe, the wittiest woman in America!

Now our guide indicates the framed Greeley letter, the shelf of Caryana, the woodcut of the first, the wee brown Clovernook. We pass into the front hall where beneath the narrow, winding stairs she opens the door of the manuscript closet.

'This is where the poets hid their manuscripts from their stepmother, who was unsympathetic,' is her explanation.

Dear little Cinderella girls, motherless Alice and Phoebe, toiling and drudging by day, studying and writing by night, denied even the luxury of a candle, but making your own lamp of a saucer of lard and a rag! America, we think, has no other story quite like yours. The tears are always very near when we gaze into the shadows of your manuscript closet. In the hall above is the child's ladder-back chair, still boasting some of its gay red paint and the stenciled initials P. C. (Phoebe Cary) on the back. It would seem to belong to an earlier, happier day. Flashing, black-eyed Phoebe was thirteen, we recall, and done with childish things, when she began her career as a poet, sending verses to far-away papers and rejoicing as she was never after to rejoice when the home papers copied them.

*Just Like the Spider's Winding Stair*

The bedrooms on the second floor are occupied by the present inmates of the home. One has been converted into a bathroom. Otherwise they are much as they must have been in the beginning; low-ceilinged, quaint, with convenient built-in presses near the mantels. We cross by way of the second-floor porch to the rear bedroom and thus down the winding stairs which have not their equal anywhere unless it be in the poetry of Ann Taylor.

Yes, we are sure, the spider's winding stair was no more perilous than this. Such narrow, narrow treads! Our guide warns us to be careful, and we fain would lend her a helping hand. This she scorns, however, asking only that we close the protective gate. We descend into the pleasant dining room of Clovernook, now a sewing room. Yes, a sewing room! And we are to see still greater marvels.

We make our exit by way of the side porch, note the cylindrical pillars of brick—brick designed and fired by Robert Cary for that special purpose. We take our leave of the shrine sacred to the poet sisters, who strove and wrote, alone, in secret, for ten long years until their names were known through all the land.

There is the deep-walled well, the orderly garden, the old gray barn to remind us of that far-away time when Clovernook was new and its inmates young and happy. But here is the shop, a modern building, where our guide takes leave of us with a few parting words to 'Mademoiselle.'

Within are the looms—hand looms dating back to the Cary régime, though not of it, gathered from all the country round that the patient blind folk might here earn their daily bread. Clovernook is not a charity but a self-supporting institution and proud of it. From the heaping boxes and baskets of riotous color, such as would delight an artist's eye, are woven rugs of rare beauty and design that find a ready market in our own and other cities.

A teacher directs and the rugs take shape under the skillful hands of her pupils. Here are the old-time hit-and-miss patterns, fashioned of gay cretonnes from the mattress factory; here are all shades of bright ginghams with borders unknown, undreamed of by the pioneer crafters; here are tiny doll rugs for a New York emporium. It is difficult to choose between them and the patterned couch covers and pillows and the hand-woven linen scarfs.

*Sabbath Evening Receptions in the Library*

But we take our leave of them at last, proceed to the second department of the shop, where the Clovernook books for the blind are made. Those who do not see are patiently at work transposing into Braille and New York point. We see the brass plates made and the printing—stamping, rather—of the pages done. The books completed will find a sale in all parts of the country. All our leading libraries now have departments for the blind, where they are in constant use.

Clovernook was inexpressibly dear to the Carys, as it is inexpressibly dear to all who know their story. They left it, it is true, in the early fifties, when at the very threshold of their careers, but all their after-life, their thoughts and poems were colored by that sweet, sad chapter lived at Clovernook. In New York, in their more pretentious 20th Street home, the world of art and literature and music paid them homage, but they were still the poets of the country and the farm.

Their Sabbath evening receptions in the library—a library boasting a thousand volumes in place of the meager seven they had known in childhood—were the *Who's Who* of the fifties and the sixties. There always was Mr. Greeley, of the *Tribune*, Mr. Bonner, of the *Ledger*, Mr. Bowles, of the Springfield *Republican*, Colonel Knox, of the *Sun*, Dr. Field, of the *Evangelist*, Mr. Elliot, of the *Home Journal*, Mr. Gilder, of *Hours at Home*, Mr. McCarthy, lately of the London *Morning Star*.

*Whittier Was Always a Welcome Guest*

Whittier, when in the city, was a most welcome guest; likewise Bayard Taylor, Thomas Bailey Aldrich, and the Stoddards, poets all. Women writers, actors, reformers of the day, were represented by Kate Field, Mary L. Booth, Mary Mapes Dodge, Anna Dickinson, Elizabeth Cady Stanton, while Mr. Chambers, of Edinburgh, of *Information for the People* fame, Ole Bull, the divine Norwegian, and Lord Adare, of Scotland, made a cosmopolitan note in the gatherings.

It reads like the veriest romance, the story of these self-taught poets who went forth to win fame and honor among leaders of their day. Theirs is a literary heritage to be treasured with the rest. Taste in poetry has changed, we know, but love of courage and fortitude remains the same, we trust.

# Scandal Never Was Cleared Up!

(*Continued from page 5*)

Service operatives assume to have authority over civil service clerks conscientiously doing their duty and also that such service is charged with suppressing instead of seeking information.

Aside from the mystery thrown around the sudden dismissals of the twenty-eight heads of the Bureau of Engraving and Printing, caused by the refusal of President Harding to explain his action, though the Senate stormed and the country wondered, the opposition of the Treasury Department to the investigation from beginning to end and its unsympathetic manner toward the new appointees of President Harding, directly under it, have been the most puzzling feature of the whole matter.

Something of an understanding began to dawn soon after Mr. Coolidge became President. Investigations became the order of the day. The Daugherty investigation was being clamored for and the particulars of the Teapot Dome which involved two other Cabinet officers were known among the Senators. Senator Caraway renewed his demands for reinstatement of the Bureau employes whose discharge had been attributed to politics, and it was stated in the press that he threatened a wholesale investigation of the Treasury unless the employes were reinstated without further delay.

Whether and why any department should fear an investigation was not touched upon, but it is the fact that Mr. Louis A. Hill, the director of the Bureau, who had refused the reinstatement and whose resignation was also being daily predicted in the press, was sent for by Mr. Mellon and told in practically so many words that he could remain if he would withdraw his opposition. He did not accept the offer and his resignation was immediately requested, no reasons being given, although he had just been commended by the head of the Appropriations Committee for his efficient administration in saving about a million and a half a year in his bureau. Simultaneously the deposed heads were reinstated. The Treasury had apparently escaped the threatened investigation. This was in December, 1923. Remember the date.

It has been necessary to devote much space to the Engraving Bureau to give a proper perspective. In reality the Bureau of Engraving formed but a small part of the investigation of the duplicate bonds. *It was, however, so constantly played up in the press that it soon became apparent that the purpose was to obscure the real issue.* Smoke screens had become the order of the day.

In the papers filed in the Supreme Court of the District of Columbia in the case of Charles B. Brewer, plaintiff, vs. Andrew W. Mellon, Harry M. Daugherty and their assistants, defendants, in which the court was told that much of the evidence in the case had been destroyed by the Treasury Department and was asked to prevent the defendants named from taking from him the bonds and other evidence which he stated both President Harding and President Coolidge had ordered be held in his custody, and from destroying it as they had done with other evidence, an incident is related in which a quotation is given from President Harding which furnishes a connecting link to an important turn in the whole matter.

This incident is referred to in the record of the court by Mr. Brewer, the petitioner, as follows:

'During this investigation, your petitioner, acting on the authority vested in him withdrew from the office of the Register of the Treasury certain duplicate bonds, which had been paid and surrendered, and after having ascertained that the numerals on said bonds, although identical as to figures, had been impressed on said bonds from type of entirely different fonts, your petitioner submitted these bonds to the President of the United States for his inspection.

'Upon presentation of said duplicate bonds to the President, the President called the defendant, the Hon. Andrew W. Mellon, to the office of the President at the White House and then and there, and in the presence of your petitioner, the President of the United States said: "Mellon, they call this man a 'nut.' It takes a 'nut' to bring me such things as you see there (referring to the duplicate bonds spread before them). *They are after this man good and hard, and I do not intend to let a thing happen to him,*" to which statement of the President of the United States the Secretary of the Treasury made no response, but nodded his assent.'

The italics are the writer's. Mr. Brewer was asked particularly about this part of the statement—as to its meaning, if he knew. He stated he knew this much. He had been the victim of a 'whispering' campaign intended to dislodge him and he knew that as a part of that the president of a large banking house with influential New York connections had visited the President and attempted to do his part in the campaign of whispering and that the President remained unmoved.

This was in the summer of 1922.

The court record shows that whoever the 'they' were to whom the President referred, they *kept* 'after this man good and hard.' The 'whispering' changed into full speech and ripened into an open attack by the press which periodically prophesied Mr. Brewer's 'immediate' separation from the service of the Government. It was without avail as long as President Harding lived. He wanted the truth without fear or favor, to secure which he had given Mr. Brewer the following credentials:

The White House,
Washington, June 30, 1922.

My dear Mr. Brewer:

It is well understood throughout the Treasury Department and by Secretary Mellon that you are to be permitted to secure all the information you desire in making the investigations which have been committed to you. The presentation of this letter to any concern dealing with the Government or with the department will undoubtedly make available to you all necessary opportunity for investigation. If these credentials are not ample please report to me the specific case and a special order will be issued.

Yours very truly,
Warren G. Harding.

Mr. Charles B. Brewer,
Special Assistant to the Attorney General, Washington, D. C.

The record shows that President Harding was evidently fearing that the investigation would encounter opposition, for at an earlier date he had said to Mr. Brewer: 'Go out and get the truth, and if there are any blocks put in your way, let me know.' The record also shows that *the only place where such opposition developed was within the Government.* And it shows, too, that the only place at which a refusal to honor President Harding's credentials was met was in the office of the Treasurer of the United States and that it was met at the specific direction of the Under-Secretary of the Treasury, Mr. S. P. Gilbert, now honored with the position as representative of the Dawes' Plan in Germany. The following memorandum speaks for itself:

November 2, 1922.

Mr. Charles B. Brewer, attorney of the Department of Justice, called at this office today, being introduced to Mrs. Turner, confidential clerk, by Mr. Warner in my absence and in Mr. Ellis's absence. He asked for the date of a shipment of bonds from New York in 1919, saying Mr. Mellon had authorized capital heads to permit him to examine records if accompanied by a representative of a division.

I telephoned Mr. Gilbert's office and Mr. Gilbert stated that Mr. Brewer's authority extended only to the Public Debt Service.

C. H. Hearst,
Assistant Chief Division of Securities,
Office of Treasurer of the United States.

On the witness stand Mr. Hearst afterward admitted that before seeking Mr. Gilbert's permission he had been shown a photostatic reproduction of the President's letter of June 30, 1922, but pleaded that it was as much as his position was worth to take the orders of even the President of the United States without consulting Mr. Gilbert.

Mr. Brewer testified that having learned early in his investigation that destruction of bonds, which would be needed to prove or disprove duplication, duplication of payments and certain thefts from Treasury vaults were in progress, he sought Mr. Secretary Mellon with a request from the Attorney-General that such destruction be stopped, as the bonds would be needed as evidence—and that he saw Mr. Mellon at his residence, having been warned against probable interference at the Treasury. That was the first intimation that the Treasury had of an investigation; and within a day or so three witnesses had been threatened by a Treasury Secret Service operative if they 'talked to that man Brewer.'

The visit to Mr. Mellon's residence was in June, 1921 (nearly a year before the President took charge of the investigation). In December it was learned that destruction had never stopped; in fact, the force had been doubled. The acting Attorney-General was consulted and word got to the President, who immediately wrote the following to Mr. Mellon:

(Personal and confidential)

The White House,
Washington, D. C., December 19, 1921

My dear Mr. Secretary:

I talked with you this morning over the telephone about suspending the destruction of bonds which have been exchanged for new ones etc., and was very greatly pleased to have your assurance that this destruction would be permanently suspended. I think this administration ought to take that course as the surest manner of self defense.

These bonds will not require any very

extended storage space, and we will have a very valuable refutation of neglect on the part of this administration if these exchanged securities and other questionable cancellations are preserved for future reference and inspection.

I trust you will make the order a very explicit one and allow no variation therefrom.

Very sincerely,
Warren G. Harding.

The Secretary of the Treasury,
Washington, D. C.

The record shows that the President's telephone message, or his letter, or Mr. Mellon's 'assurance,' if given as stated, *did not stop the destruction.* It was found to be in *full progress four months later* when, in April, after the discharge of the officials of the Bureau of Engraving, the Bureau was opened to the investigation. The report of the Register of the Treasury for 1922 on page 5 fixes the date that the destruction stopped as April 22, 1922.

The record also shows that between June 27, 1921, the date of the visit to Mr. Mellon, and April 22, 1922, over forty-five million securities, of a value of about ten thousand million dollars, were destroyed.

Mr. Brewer's testimony, before the committee of Congress which investigated the subject until stopped, connects in a curious way the ignoring of President Harding's credentials and his letter to the Secretary of the Treasury, ordering destruction to cease, which was dated *December 19, 1921.* He testified that on November 2, 1922, at the Treasurer's office, where the President's credentials failed to be honored, he was seeking information relative to one hundred and ninety $1,000 bonds referred to under the subject of 'Spurious Bonds,' all belonging to the same thousand and being numbered between 2,338,110 and 2,238,911, and that subsequent investigation gave the record date for the destruction of $87,000 worth of these then paid and in the Treasury as *December 19, 1921*—the very day the President, in the 'morning' ordered destruction to cease. Affidavits of two officials of the Bureau of Engraving in charge of numbering bonds declared duplicates of these to be spurious.

These two officials have since been demoted, it is understood.

When the committee of Congress was appointed and the management of the Bureau had been changed, two other officials pronounced the bonds to be genuine.

These two officials have since been promoted, it is understood.

Several attempts of Mr. Brewer to get possession of the bonds to have the numerals shown by enlarged photographs had not been successful on March 4, last. On that date the life of the committee was allowed to expire. Or, rather, extension of its life was refused, though requested by the committee.

All securities, duplicate bonds and evidence were turned over to the clerk of the House of Representatives for delivery to 'next' Congress

Mr. Brewer was discharged as of March 31, 1925, by Attorney-General Sargent the first or second day he took office, at the request of Mr. Mellon and with the consent of Mr. Coolidge, it was remarked to members of the Congressional committee who remonstrated and filed a letter signed by the three majority members pronouncing such action as 'a travesty on Justice.'

Mr. Brewer had previously been discharged as soon as the mourning party returned from President Harding's funeral. He wrote a vigorous letter to President Coolidge, who overrode the action of his Attorney-General and revoked the discharge. The investigation was ordered to proceed. An almost prohibitive time limit was set for its completion; within three months, January 15, 1924. About all that was accomplished was that Mr. Brewer was able to remain long enough to have a committee of Congress save his reputation, which had been assaulted with a brutality scarcely believable because of his exposure of certain Treasury practices.

Now that his credibility *is* saved and the evidence all saved, the 'next' Congress (the one now sitting) has done nothing toward recovering the $110,000,000 losses already shown and ascertaining what else there is to the questions of fraud raised by the committee which expired.

## In the Land of the Everlasting

(*Concluded from page 6*)

as a power. If by power you mean armies and navies, as you probably do, then you can rule out China now, and perhaps for decades, or even centuries, to come. Napoleon once said that if he could draw upon the millions of Chinese, he could rule the world. 'Chinese Gordon' who led an army in the Taiping rebellion, once said that the Chinese soldier, with proper training and equipment, was but little inferior to the British soldier.

However, the fact is that the Chinese is not naturally a fighting man. For five thousand years the soldier has been considered the lowest in the scale of professional occupations, and my own conviction is that the low rank of the soldier was so placed originally not because of inferior fighting abilities to peoples of other races, but because of a natural aversion to physical combat itself.

On the other hand, if *power* in a people is meant to describe an inexhaustible supply of raw materials, coupled with an equally inexhaustible supply of cheap labor, then China during the present century will be one of the prime economic factors in international commerce. The combination of these two factors—materials and labor—makes China the greatest competitor against the rest of the world.

China has been a conglomerate mass of homogeneous particles with sedan chairs, wheelbarrows and carts, forming the loose ties of economic cohesion. Now telegraph and telephone lines knit together every great city and all the provinces in the nation. Steamer lines, railroads, 700 daily papers, with scores of weekly and monthly magazines, are gradually pulling together these particles of China into one organized mass. Of course it will take years. But with modern methods of achievement, it will not take too many of them.

There are those who say that the day of achievement is too close. Certainly the course which is taken by these fifty-century-old people will be the really great news of 1950 and after, for in what direction they do move they will gradually and eventually *smother* resistance.

We of the West have a few short centuries behind our work of today. The people from the Middle Kingdom walk out irresistibly upon the stage of the 20th Century with millenniums at their backs and with the light of future centuries in their eyes.

## Presidents Should Live in Style

IN THE campaign of 1900, the democratic candidate for Congress in an eastern district of North Carolina addressed an audience of simple country folk in the country court house.

The speaker was seeking reëlection after one term in Congress. He made a vehement attack on the Republican administration for its extravagant appropriations, and, in the course of his remarks, exclaimed:

'Why, my countrymen, it has been my fortune to attend some of those great McKinley receptions yonder in the White House! Do you know what they remind me of? They remind me of those historic accounts of which you have read (of course none of his audience had ever heard of them) of the royal court of the French King, Louis XIV, when the King, sitting on a raised platform, received the homage of his courtiers. Yonder in that great reception hall of the White House, its walls tapestried with the finest of tapestry, its floors carpeted with the finest of carpets, in a blaze of electric lights—all paid for my countrymen, with *your money*—Mr. McKinley stands in swallow-tail coat, with a ribbon tacked in front of him, indicating thus far you can come and no further. There are women who attend those receptions who wear $20,000 dresses! Think of it!'

The reaction to a speaker's appeal is often the unexpected; particularly so with an American audience.

There sat next to me an elderly man, large and portly, with round and flushed face, who wore a homespun shirt, unbuttoned at the collar, and who, with eyes intently directed at the speaker and mouth wide open, had been listening closely. I knew he was a great friend of the Congressman and a Democrat proudly boasting at all times that his father was a Democrat, he was a Democrat, and his eleven grown sons were all Democrats. I think he would have voted for the late Booker Washington, despite his innate southern prejudices, if, perchance, he had been nominated for President on the national Democratic ticket.

I nudged him. 'You are a friend of the speaker and a great Democrat; how do you like that Republican extravagance and picture of the McKinley receptions?' I asked.

'Wall, I'm a Democrat and so is them sons of mine, and thar grandaddy before 'em, but I thinks that picture is *all right! I wants the President to live in style!'*

You might talk forever socialism, bolshevism, sovietism or communism to this type of old-fashioned American, and there are thousands of them, and he will listen attentively, but he would never be led away from his inborn and inbred spirit of American ideals. You might tell him of how the Government provides the *Mayflower* for junketing trips of the President, because he is Commander-in-Chief of the Navy; that it costs $500,000 annually to maintain the yacht which would be of no more use to the Navy in war times than an animated bathtub; but he will sit on the banks of the Potomac, watching the beautiful ship gliding down the river, with the President and his guests aboard, and, instead of protest against the useless extravagance, feel proud of the fact that the 'President lives in style.' Not because of the man, whether Republican or Democrat, but because he is the 'President.'

# The Voyage of the *Victoria*

(Concluded from page 17)

servant. There was an intense egotism about him which made him regardless of the feelings of others. We gather that from his dealings with Faliero. All during the year of preparation there was an endless waste of combat, and men were at one another's throats on the pettiest occasion of dispute, yet, because of that quality of vigilance in him, for one thing, Magellan kept his ground and went about his business full of determination to do what had to be done on his own terms. That is shown very clearly in his employment of men. For, because of that anti-Portuguese sentiment, in royal messages great emphasis was placed upon the reduction of the number of Magellan's countrymen in the fleet, and the irreducible minimum was placed at one for each ship.

Nevertheless, one way and another, Magellan managed to put into service seven times that number, many of them in positions of lesser command. There was his cousin Martin Magellan for one. There was Barbosa, his brother-in-law. There was Alvara Mesquita, his cousin. Then there was Joao Serrao, brother of that Serrao who took service with the native monarch in the remote East. There was a Goncalo Rodriguez and an Antonio Fernandez, two hard-fisted adventurers who did effective work when the proper time came. And there was a pilot, Carvalho, who had been to Brazil and lived there in indolence for a time, until the *wanderlust* seized him.

But objectors to the employment of Portuguese had not so much to say when came the time to get men together, because in spite of public criers and trumpets and banners and slogans and men-at-arms who persuaded and promised, the quota could not be mustered. So there was a turning to wilder and more adventurous spirits, and a motley crowd joined at the end. One lone Englishman, a Master Andrew, of Bristol, sailed, to leave his bones in the Ladrones. There was a Maestre Ance, a master gunner, who proved to be a German named Hans. He was the first of his nation to circumnavigate the globe, though he died in a Lisbon prison at the end. There were negroes, a Malay or two, several Frenchmen, a few Sicilians, Greeks, Genoese, and some who had private reasons for keeping their origins secret. Some forty young men of good family accompanied the fleet, joining at the last moment, but they sailed for adventure's sake and without pay, and were known as *sobresalientes*. At the end, roughly, the ships' forces ran thus:

When came the time to get men together, the quota could not be mustered. So there was a turning to more adventurous spirits, and a motley crowd responded.

| | |
|---|---|
| *Trinidad*, Captain Magellan | 62 men |
| *San Antonio*, Captain Cartagena | 57 men |
| *Concepcion*, Captain Quesada | 44 men |
| *Victoria*, Captain Mendoza | 45 men |
| *Santiago*, Captain Serrao | 31 men |
| (Unattached to any particular ship) | 29 men |
| Total | 268 men |

At last came Wednesday, August the tenth, 1519, when Magellan was given the royal standard, when the people of the town swarmed on quays and housetops, when men-at-arms arrayed themselves under their banners, when flags were a-flutter on the five ships, when bombards roared and men shouted, as the little armada dropped down the river with a fair wind on the first round-the-world cruise.

Much good ink and paper has been used in telling of the pageant, much has been said of the glory that was Spain's, much praise has been given to church dignitaries and rulers and functionaries who are supposed to have thrown into the cause zeal and genius and labor to further the cause of civilization, but precious little emphasis has been placed upon the fact that the whole expedition was made possible by men who were after business, men like the Haros and the Fugger brothers and the Roths of Augsburg. It has been the fashion, indeed, to talk about ignoble commerce with flippant jests. But still, behind all the noise and glitter and ceremonials, there were the useful and influential men of commerce, and in their ranks, doing their bidding, were men of character, men of well-trained minds who attended to their own affairs and worked patiently for real and enduring results. Glory and fame did not enter into their schemes. Philanthropy they left to others. Nor did they talk of their self-sacrificing zeal for the public welfare. They were commercial-minded men who found their work attractive, and the sending out of conquistadores was part of the great game that began and ended in the countinghouse.

## Intimations Are Dangerous

THERE was nothing in the appearance or manner of a certain judge who presided over a criminal courts bench of a Southern state, which would invite familiarity. His countenance was stern, his manner forceful and his speech emphatic. The gravity of his judicial bearing was a matter of indifference, on one occasion, to a crack-brained negro woman. She had charged her husband with assault and battery with a deadly weapon and, while on the stand, the court examined her.

Court: 'You say your husband tried to kill you?'

Witness: 'Yas, mass jedge, dat's what he done. De ole rascal ub a nigger done *his bes'* to kilt me. He done try to shoot me dead.'

Court: 'What did he try to shoot you with?'

Witness: 'What he try shoot me wid? Now, what you ax me dat fur? Doan' you knows when a man goes gunning, dat he don't tell de bird dat he's got a five shooter, or a six shooter, or a seven shooter! And de bird don't care noways, if he done gits kilt!'

Court: 'Sheriff, you can remove the witness. The woman is evidently crazy.'

At this intimation the woman, who had become very talkative, turned upon her husband, with glaring eyes, excited manner and wrathful ejaculation, and said:

'You ole becurious, cracked-brained debilt, I's gwine to tuck dat six shooter and blowed de top of'en dat kinky head of your'n—do you h'ar me?'

Then, with quiet manner and courtesying to the judge, she said:

'And mass jedge, you can't do nutten wid me nudder, *kase you done say I's crazy!*'

# Old Boston's Historic Highway—State Street

(Concluded from page 8)

Crown, and the Bunch of Grapes, where 'elegant' dinners were served and which was reputed to be 'the best punch house in Boston.'

The last Friday in September, 1768, the British troops landed at Long Wharf and marched up King Street into the heart of the inhospitable city. No one would rent them property, not even tumbledown warehouses, and they finally took possession of Faneuil Hall, the State House, and the Common. From then on, the red coats of the intruders were a constant irritation to Bostonians. The officers made themselves at home in the taverns, especially the British Coffee House, and here occurred that unhappy affair which put an end to the career of James Otis.

Otis had spoken his mind about the revenue officers in the *Boston Gazette*, and a few days after the article appeared he was seated in the Coffee House when Captain Robinson, commissioner of customs, entered and accosted him. A heated argument followed in which Robinson seized Otis by the nose. Then there were blows, and Robinson's followers joined the fray, so that Otis would undoubtedly have been killed had not John Gridley, who chanced to be passing, come to his defense. Both men were seriously injured and Otis never recovered his health. Robinson was ordered to pay a fine of 2,000 pounds, but when he wrote a contrite letter of apology, Otis generously forgave the debt.

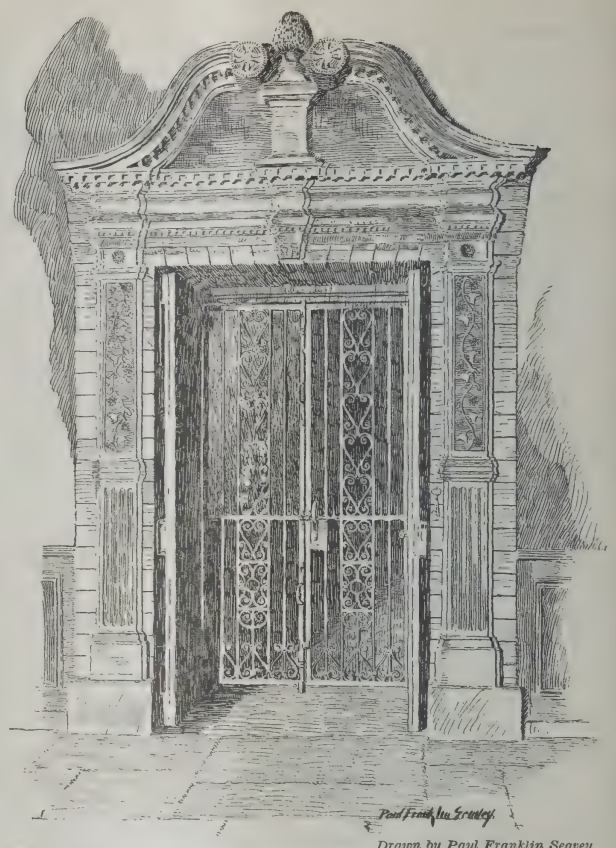
Such broils were all too common in those days and sometimes the shoe was on the other foot. John Malcolm, collector of customs, had added to his unpopularity by ill treating a lad and some one suggested the 'new punishment.' That meant tar and feathers, and, thus decorated, he was carried to the Customs House on King Street, where he was flogged and then paraded through the town for an hour or so. Malcolm considered England a better place than Boston in which to get redress for his wrongs, but the Revolution broke out and his case was never settled.

*It Was the Scene of the Boston Massacre*

The most disastrous of these quarrels was the Boston Massacre. On a bright moonlight night in early March two young men were passing through Boylston's Lane where a sentry was stationed, amusing himself by hitting his sword against the wall and 'striking fire plentifully.' The young men refused to answer his challenge, a fight ensued, and he called for aid. Two soldiers came running out of the barracks, one armed with a pair of tongs, the other with a shovel, while brickbats served the Bostonians.

Soon the inevitable crowd gathered, and not wishing to be left out of anything, they began harassing the sentry in front of the Customs House so that he shouted for reinforcements. Six soldiers came to his aid and they formed a semicircle with drawn swords about the door. Rumors were carried to Captain Preston that it was a plot to murder the soldiers and he arrived in great excitement, courageously placing himself between the soldiers and the crowd, hoping to ward off trouble. There was a great deal of shouting and confusion, no one could tell whether orders were given or not, but the soldiers fired a volley, the mob withdrew, and there were five men, dead or mortally wounded, on the ground.

The morning after the massacre the citizens assembled in Faneuil Hall and sent a committee, with Adams as spokesman, to wait upon Governor Hutchinson in the Council Chamber of the Old State House and secure the removal of the troops. The Governor beat about the bush, suggested that one regiment might go, but yielded before the stern command, 'Both regiments or none.' Lord North, in England, always called these troops thereafter 'Sam Adams's regiments.'



Newspapers had not yet invented the 'column,' but busy diarist of the time recorded the sayings of the town wits, chief among whom was Mather Byles, pastor of Old North Church, and a Tory. He chanced to meet Adams the afternoon that the troops were removed to the 'Castle' and asked him if he had not as soon be governed by one tyrant 3,000 miles away as by 3,000 tyrants one mile away.

On Thursday morning in July, 1776, State Street and its tributary lanes were crowded with anxious citizens. On the stroke of one the solemn figure of Colonel Crafts appeared on the east balcony and, in resounding tones, he read the Declaration of Independence. When he had finished, bells clanged out over the city and cannon roared across the harbor. The thoughtful withdrew to their homes, but the mob proceeded to tear down signs from Tory shops, pull down tavern emblems that purported to bear a resemblance to George III or his minions, to build bonfires with them, and otherwise disport themselves merrily.

Seven years later peace was proclaimed from the same balcony, but it was to a different city. Hancock was governor in the Old State House and Adams lieutenant-governor, but the stronghold of the Puritans had bowed before war, the overthrower, and cast away many of its gods, some of the true along with the false.

In 1793, to honor the French Revolution, a strange procession passed up King Street, now proud of its new name of State. In the place of honor was a cart twenty feet high, drawn by fifteen horses, and bearing an ox weighing 1,000 pounds, roasted whole, with gilded horns. There followed two hogsheads of wine drawn by six horses, and a van containing 800 loaves of bread.

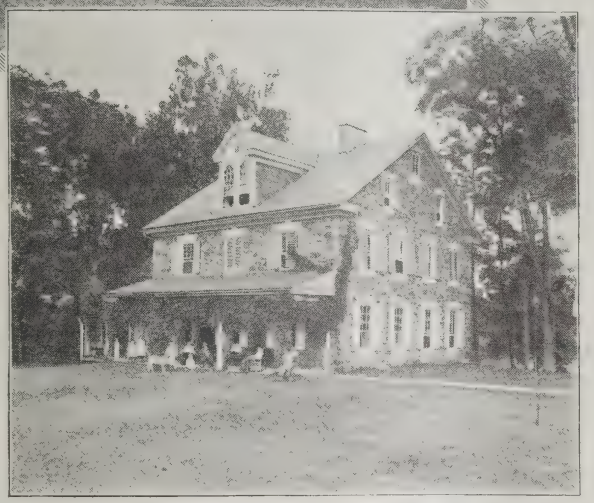
Tables were spread in front of the Old State House, although it was January, the ox cut up, and its horns, decorated with the French and American flags, nailed to the top of the liberty pole. But Boston was not cut out of the same piece as Paris, and before long crusts of bread and bones were flying through the air, and the 'civic feast' was a failure. In a few days news was received that Louis XVI had been guillotined, and the city repented of its unseemly revels.

*Drawn by Paul Franklin Seavey.*

Old door from Hatfield, Massachusetts, now in the offices of the State Street Trust Company.

There had been more dignified and worthier processions up State Street. When Lafayette returned to visit America, the whole country was wild with enthusiasm and nowhere was his greeting warmer than in Boston. The State House looked its very best, and all the street was gay with banners as the hero marched by. Lafayette had a yearning to remain near the 'lovely fields of New England,' as he called them and he wrote regretfully to his wife, 'We only want the first dollar to buy our farm with.'

But all those splendid ovations pale in comparison with the *cortege* that escorted Anthony Burns, a penniless slave, down State Street. Shops were closed and the flag, draped in mourning, was hung from the windows. Across the street, near the Old State House, swung a black coffin bearing the legend, 'the funeral of liberty.' Two cannon from the head of the street faced the crowd, the light dragoons made a passageway, and, surrounded by an escort of infantry and artillery sufficient for a czar, the slave, with unmoved countenance, proceeded to Long Wharf where a vessel was waiting to take him back to servitude.



State Street has by no means lost its character of former days. The water has been pushed back somewhat, but there is still Long Wharf at its lower end, overshadowed by the graceful tower of the Customs House, Boston's only skyscraper.

# Pennsylvania's Land of Goshen

## A Fertile Tract Where Crop Failures Are Almost Unknown

By JOHN DAVIS ANDERSON

Above—Scene on a farm in Southern Pennsylvania. Below—Typical of the dwellings in the Pennsylvania farming belt.

EMBRACED in that section of Pennsylvania with Philadelphia at the southeast corner, then extending northward to Reading or beyond, and thus toward the southwest and covering a part of Maryland, we have bounded one of the finest farm sections in the United States. The reason for this is not far to find.

It must be remembered that at the time when the early settlers were coming to North America—during all that time previous to the Revolution—virtually all of them were farmers. There was no manufacturing. The farming industry, in one form or another, represented nearly the only occupation until villages grew into towns and small cities, and even then the articles of commerce were products of the farm.

Only a small portion of that part of Pennsylvania which is described within the area first mentioned was settled by the Quakers. Penn and his followers formed Philadelphia in 1681. This was almost two centuries after Columbus discovered America. There was not a sufficient number of Quakers who came with or followed Penn to form a colony sufficient to occupy that large grant of land which had been allotted to him by virtue of the services which his ancestor, as an admiral in the British Navy, had rendered to his country.

A number of trips to Europe brought Penn closely in touch with the situation as it then existed upon the Continent. There was unrest everywhere—in Holland, in Germany, in Switzerland and in the Scandinavian countries. Penn induced many of these people to emigrate to his colony. Perhaps the most thrifty of them all, and certainly the ones who achieved the most success after arriving, were the Pennsylvania Germans.

No matter whether the German settler landed in Pennsylvania or in the colonies to the north or south, he always showed the same aptitude for agriculture, and here, today, in this broad region we find the culmination of the thirty generations through which his ancestry can be traced. The raising of potatoes, the cultivation of tobacco, together with dairy products, show the wisdom which the Pennsylvania Germans displayed on first coming to this country. Instead of locating close to the river banks, they chose the uplands—the limestone soil which is the source of their agricultural success.

It is difficult to estimate the number of Germans who came before the Revolution. From 1727 forward records were kept of the emigration at the port of Philadelphia, and we know that upward of 68,000 arrived between 1727 and 1775. These were the ancestors of those who moved westward, cleared the land and started the large and productive farms which we find in the southern belt of Pennsylvania. In those early days they represented probably one-third of the population of the state. A good many had gone into Virginia and North Carolina. This was commented upon by Benjamin Franklin. The principal settlements which they had made were in Germantown, on the outskirts of Philadelphia, and the nearby counties of Montgomery, Lancaster and Berks, and later they pushed northward and westward into Lehigh, Lebanon, Dauphin, Northampton and Monroe counties. The Susquehanna River did not bar their moving westward, and we soon find them in York, Cumberland and Adams counties and following the slopes of the mountains they went southward into the Shenandoah Valley and in the Harpers Ferry region and as far west as Lexington, Kentucky. Later we find many of them in Tennessee.

What we see in traveling through this Southern Pennsylvania region today is the result of the thrift of these people and splendidly cultivated land, immense barns and evidences of prosperity. Dr. Benjamin Rush said that the Germans did not look so much to the river valleys as they did to the limestone land, and land rich in forest growth, and because they were in a position to pay cash, frequently displaced the native-born settlers from the best farm lands. Their methods of farming were thorough and they put their land under a good state of cultivation by patient labor. They believed in the rotation of crops so their land did not become exhausted.

Very few of these old farms in Pennsylvania today are worked out and with little effort are made very productive. The German was always economical. He saved even the wood which seemed so abundant, and used stoves instead of the huge fireplaces. In his mode of living he was frugal, his diet was simple, his furniture plain but substantial, his homespun clothing of the best material and calculated to last a long time. His standard of living was somewhat lower than that of the native population, but was suited to insure his success in farming.

Everything about his place was in good order; fences, gardens, implements, buildings. As in all good farming regions, the barn was more imposing than the house and the particular style of architecture of many of these German barns first built in Southern Pennsylvania made their way later along the line of the Ohio River and may be seen today even as far west as Wisconsin.

Before the coming of the railroads the German farmers used the Conestoga wagon and this formed a familiar sight from the valley of the Mohawk to Carolina, and later, in the days of progress westward, its descendant crossed the plains in the form of the prairie schooner. In a journey through this Pennsylvania region I have found that these people have made it a pride to keep their farms in their own family generation after generation. This has been especially true of the Mennonites in Lancaster County. They have not only kept their own land but have purchased land from other nationalities. A century ago they kept the Irish moving and they have done the same with the native population. It has been no uncommon thing in this region for the Scoto-Irish to give way to the Amish in Lancaster and other counties, because of the latter's extraordinary success as farmers and the tendency to purchase land from other old families.

Lancaster County has ever been looked upon as the most fertile of all; it is claimed that within the memory of the oldest inhabitants there had never been an entire failure of all of the crops. Six-sevenths of the entire area, or 463,000 acres, is farm land.

# A Dance a Week

## Presenting Two Old Favorites—

## Plain Quadrille and Novelty Two Step

Readers of THE DEARBORN INDEPENDENT have made written requests for their favorite old American dances. We are glad to announce that these requests will be fulfilled in this department during the season.

This week we are submitting, upon request, a description of a Novelty Two Step; also another Plain Quadrille, the latter containing a description of the movement of the Dos a Balinet. This latter movement is also described by request. In studying the Dos a Balinet, it is well to practise with the complete set of eight people. Any of the quadrille music already published in THE DEARBORN INDEPENDENT may be used for this quadrille.

The Novelty Two Step is worth knowing by hosts and hostesses, dancing instructors or masters of ceremonies, because of its adaptability for entertaining either a large or small assembly. The music used should be lively, such as reels and jigs.

## PLAIN QUADRILLE

### FIGURE 1

ADDRESS PARTNERS, THEN CORNERS

First four forward and back ..... 4 bars
Circle four hands around ..... 4 bars
Right and left with right hand couple ..... 8 bars
Ladies chain with left hand couple ..... 8 bars
All join hands forward and back ..... 4 bars
Turn corners ..... 4 bars

Sides the same. Play twice.

### FIGURE 2

WAIT FIRST EIGHT MEASURES

Head lady swing opposite gentleman with right hand ..... 4 bars
Side gentleman with left ..... 4 bars
Opposite gentleman with right ..... 4 bars
Partner with left ..... 4 bars
All forward and back, turn partner ..... 8 bars
Grand right and left ..... 16 bars

The next lady, etc. Play four times.

### FIGURE 3

WAIT FIRST EIGHT MEASURES

First four lead to the right ..... 4 bars
Dos a balinet ..... 2 bars

The leading couples join nearest hands with their partners, and lead to the right, pass through that couple, and balance. Two couples are now standing back to back.

Gentlemen contra balance ..... 6 bars

From the above position, each gentleman joins left hand with his partner's left, and right hand with the right hand of the other lady. Gentlemen are now facing each other, and should balance. The ladies are standing back to back. Both gentlemen drop hands with the other couple, and turn their own partners, with the left hand, forming a circle. Gentlemen are now facing out, and ladies facing in, balance. Gentlemen then turn and stand beside partner ready for

Half right and left to places ..... 4 bars
Side four lead to the right ..... 4 bars
Dos a balinet ..... 2 bars
Gentlemen contra balance ..... 6 bars
Right and left to places ..... 4 bars

Repeat with the sides. Then call 'First four to the left,' etc. Play four times.

### FIGURE 4

Eight hands circle to the left ..... 8 bars
Grand right and left ..... 16 bars
All balance partners, and turn ..... 8 bars
All chasse ..... 8 bars

Ladies to the left, gentlemen to the right. Ladies slide four steps to the left side, gentlemen slide four steps to the right side. Each meet new partner on corner, and turn. Then chasse back to place and turn partner.

All promenade ..... 8 bars
Ladies grand chain ..... 8 bars
All join hands, circle to the left ..... 8 bars
Balance corner, turn partner ..... 8 bars
All promenade to seats.

## NOVELTY TWO STEP

This is a kind of marching dance. It includes circling the hall, frequent change of partners and executing various movements in line.

The formation is as follows: two couples in a line. As many of these lines as possible should be formed to increase the variety and fun of the dance.

The line marches round the room, pausing only to execute the dance movements which the prompter may announce.

Sometimes the call will be given: 'Ladies Forward Four,' or six or eleven—any number. Which means that the line of gentlemen halts; the ladies move forward four (or any given number) of places, counting the gentleman ahead as one. If the call is given 'Gentlemen Forward Four'—or six, or any number—the line of ladies halts, and the gentlemen move forward through the required number of lines, finding their new partners. This permits constant variety of partners during the dance. The two ladies in the line, of course, will always be together, and the two gentlemen will always be together; but their opposites, or partners, will be changed upon these calls being given.

The dance may begin with a preliminary ALL PROMENADE, followed by FORM A CIRCLE. This circle may then do a TWO STEP TO THE CENTER AND BACK. This may be followed by ALLEMANDE LEFT (each gentleman turns the lady on his left with his left hand, then his partner with his right).

Or, more simple, the dance may begin with double couples in line. At the call, ALL PROMENADE, they march, circling around the hall to the left.

During this promenade many dance movements may be called, such as LADIES CHAIN. At the call the march stops, each line goes through the movement to the music; upon the completion of the movement the march resumes. FOUR HANDS ROUND: the two couples in the line join hands, whirl once around the circle, link arms again and resume the march. BALANCE AND SWING PARTNER: the line stops, the movement is executed, the march is resumed. RIGHT AND LEFT; this, like the others, is executed in line, and the march resumed. Any of these changes may be called as often as desired; the gentlemen or ladies may be ordered forward to as many places as many times as desired. These three elements—the continuous promenade, the movements in line, the change of partners—make this a dance of pleasant variety.

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions, and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Please order by number.

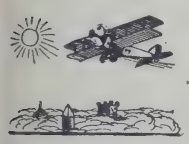
EDGAR ALLAN POE received only $52 for 'The Gold Bug' and only $10 for 'The Raven.'



ALASKA, FOR WHICH the United States paid $7,200,000 in 1867, exported $62,223,735 worth of products in 1925 alone.

ARTIFICIAL FOGS ARE being used in Norway to prevent the freezing of crops.

THE COMMON GARDEN snail has 1,500 teeth while the great black slug has more than 30,000 of them. The snail's teeth are found in rows on its long tongue and are replaced when worn out by other teeth growing just beneath.

A SMELT-LIKE FISH found in the Pacific Northwest is so fat that when dried and threaded with a wick it is used as a candle.

TO PREVENT ITS destruction by moths, Paganini's famous violin has been removed from the glass case in which it has been kept since his death in 1840, and is to be used more frequently.

TIRED OF THE darkness and gloom of London's thick fogs, six residents of that city chartered an airplane for an hour's ride high in the air where they could see the sun.

ST. LUKE'S EPISCOPAL CHURCH, known as 'The Old Brick Church,' at Chuckatuck, Virginia, built in 1632, is the oldest building of English construction still standing in America.

THE AVERAGE WEEKLY movie attendance in the United States is estimated at one hundred and thirty million.

INDIA ABSORBED HALF of the world's output of gold last year.

A BANKABLE CHECK for $1,000 was transmitted across the ocean by cable from London to New York, where it was indorsed and honored at once.

ONE PERSON OUT OF twenty-three in the United States is illiterate. There are five million residents in America, chiefly of foreign birth or extraction, who cannot read or write.

A MILLION DOLLARS in pennies is fed into vending machines each day by the American public. Each machine registers profits of $3 to $5 a month.

MOSQUITOES CAUSE ANNUAL damage amounting to one hundred million dollars, or ninety-one cents for each person in the United States. Three million cases of chills and fevers were directly attributable to these pests last year.

IRELAND IS MINTING her own coins for the first time in one hundred years. The first Irish coins were struck by Danish kings in the 10th Century.

A DECREASE OF 1.2 per cent in the number of farms in the United States between 1920 and 1925 is reported by the Census Bureau.

BUTCHER KNIVES fastened to the table with a thirty-inch chain are the only eating utensils in a restaurant at Lockhart, Texas.

THE LAST MAN'S CLUB, with a roster of thirty-four Minnesota Civil War veterans four decades ago, has dwindled to three men. A bottle of wine which has reposed in the bank vault since the first meeting will be used by the last member to toast his departed comrades.

A BOOK ON THE care of the teeth, published in Paris in 1818, contains the oldest known illustration of a tooth brush. This pioneer brush had bristles at both ends of the handle.

A SEAPLANE WILL be used by large whaling companies for the first time in history when the season opens next winter in northern waters. The seaplane will go ahead of the fleet and signal when it spots a 'blow.'

THE AVERAGE MONTHLY pay of a farm hand is now $34.38, with room and board, as compared with $32.01 six months ago.

THERE IS ONLY ONE chance in 110 of a person who commits a deliberate murder in America being executed, according to figures compiled by a Chicago judge.

CANNED BEEF, ABANDONED in 1845 by Sir John Franklin, Arctic explorer, was opened by scientists and fed to rats in London. It caused no ill effects.

TWO ROUNDS OF FLAPJACKS and maple syrup so enthused Latin-American journalists in New York that they hastened from the table to cable their respective papers of their find.

FORTY-FIVE PASSENGERS who landed at New York on a French liner had no passports. A steward throwing away waste paper had picked up the envelop containing the passports and by mistake dumped them overboard.

THE GRAND LAMA of Tibet has issued a ukase forbidding further attempts to reach the summit of Mount Everest, because of the death of native porters on former expeditions.

WHEN CONGRESS REFUSED to build a new post office at St. Mary's, Ohio, the citizens raised $45,000 by popular subscription to construct the building.

THE GRADES OF SOCIETY in China are classified by custom in the following order of importance: Scholars, farmers, artisans, tradesmen. Soldiers, no matter what their rank, have no social position.

A CARRIER PIGEON bearing a message to the naval station at San Diego arrived there perched on the running board of an automobile, where it had ridden for forty miles, according to the driver.

FARMS IN THE UNITED STATES represent one-fifth of the total national wealth and contribute one-sixth of the national income.

A MORAVIAN VILLAGE attempted to kill off its cats with poison gas to stamp out rabies. The cats were merely joyfully intoxicated by the vapors.

LOCAL TRADITION relates that in 1610 a British frigate sank a pirate vessel near Tangier Island, Chesapeake Bay. The other day Spanish dirks, battle axes and cutlasses were brought up from a submerged wreck.

EXCEPTING THE BIBLE, *Pilgrim's Progress* has been translated into more languages and dialects than any other book. The number now exceeds 107.

THE GREATEST EARTHQUAKE disaster in all history occurred in China in 1556. More than one million persons were killed. Chinese tradition refers to it as "the time when the mountains walked."

THE BIGGEST PIECE of mica ever found was taken not long ago from a North Carolina mine. It weighed 3,332 pounds and was worth approximately $5,000.

THE BOSTON MUSEUM of Fine Arts recently declined to exhibit five nude paintings, part of a collection of Italian art sent to America for exhibition.

THE DEBT OF THE United States Government at the end of 1925 was four per cent less than at the end of 1924, according to Department of Commerce figures.

A WORLD FLIGHT was planned by a Belgian as early as 1804. The project included the construction of a huge aërostat, but it was turned down by scientific societies of Europe.

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

BOOKS are chiefly useful, as they help us to interpret what we see and experience. When they absorb men, as they sometimes do, and turn them from observation of nature and life, they generate a learned folly, for which the plain sense of the laborer could not be exchanged but at great loss. It deserves attention that the greatest men have been formed without the studies which at present are thought by many most needful to improvement. Homer, Plato, Demosthenes, never heard the name of chemistry, and knew less of the solar system than a boy in our common schools. Not that these sciences are unimportant; but the lesson is that human improvement never wants the means where the purpose of it is deep and earnest in the soul.

—*William Ellery Channing.*

'ON THE WHOLE I should say America stands first in the kind treatment of animals. Now that is a fine feather in the American cap, for the treatment of animals is a sure gauge of national character.'—*John Galsworthy.*

DURING NORMAL SLEEP the electrical response of the human body increases from 50,000 ohms to 500,000 ohms.

BETWEEN $15,000,000 and $25,000,000 worth of goods, mostly textiles, hides, leather articles and silks were smuggled into Russia last year, according to Soviet authorities.

A PASSENGER LINER plying between Seattle and the Far East publishes a paper in Chinese for the benefit of the Chinese passengers.

THE BIRTH RATE of the United States has declined more than 30 per cent in the past thirty years and is still declining.

CARRIER PIGEONS WILL be used by truck drivers hauling ice into the Imperial Valley of California this summer. In case a driver needs assistance he will release a bird with a call for help on the home office.

AN APPARATUS INVENTED by two Swedish youths, which, they declare, will produce gold by the combination of two simple gases in an artificial refrigerator, has been sold for the highest price ever obtained in Sweden for patent rights.

A GEORGIAN WHO has a hen that produces 'double' eggs, each egg containing two yolks and measuring seven and one-half to seven and three-quarter inches in oval circumference, is endeavoring to evolve a new breed of fowl that will regularly produce such eggs.

BY MEANS OF active radium injected into the body, the rate of blood flow in the human system has been measured accurately for the first time.

MORE THAN 800,000 girls employed in the factories of Japan receive an average pay of less than 20 cents a day.

CANADA RANKS SECOND among the countries of the world in value of exports per capita.

WAR BETWEEN SWEDEN and Denmark is definitely outlawed by an unlimited arbitration treaty signed by the two nations.

SKIN ON THE FEET of Binghi natives in Australia is said to be the thickest found on any human beings. The Binghi have been known to put hobnails in the soles of their feet and proudly exhibit them.

A CHICAGO BOY, hailed into court on a disorderly conduct charge, was sentenced by the judge to read good books. The sentence was carried out under supervision of a court official.

SEVERAL CHINESE generals have issued edicts imposing the death penalty on any soldier found smoking opium.

OPERA SINGERS ARE entitled to a 10 per cent increase in salary when the performances are broadcast by radio, a Berlin court has decreed.

THE MOST RECENT estimate of the world's population gives a total of 1,849,500,000, of which 725,000,000 are Caucasians, 680,000,000 Mongolians, 210,000,000 Negroes, 100,000,000 Jews, 104,500,000 Malays, 30,000,000 Indians.

FOUR MILLION people in the United States moved into new homes May 1, at a moving cost of $68,000,000.

MOOSE TALLOW was recently used for motor oil in an airplane operated in Alaska. The aviator obtained the tallow from a trapper, melted it, and poured it into his engine with satisfactory results.

THERE WERE 20,820,393,746 cigarets produced in the United States in the first quarter of 1926.

FORESTS COVER NEARLY 25,000,000 acres in France, or one-fifth of the total area of the country.

A TAME ELEPHANT eats more than one thousand pounds of green fodder and twenty-five pounds of unhusked rice daily.

AN ARTIFICIAL SALT water lake, 500 acres in extent, has been formed on the Island of Zeeland, near Holland, for the purpose of raising edible eels.

EACH FAMILY IN the United States uses an average of eighty pounds of soap a year, at an approximate cost of ten dollars.

BLIND BEGGARS OF Hull, England, are given twenty-five shillings a week on condition that they stay off the streets. Free tram rides are provided blind and aged pensioners.

THE AMOUNT OF FOOD consumed in New York City in one year would fill a freight train extending from Cuba to Alaska. There are 15,000 restaurants in that city, catering to some 3,000,000 persons daily.

THE NAME OF THE famous bridle path, 'Rotten Row,' in Hyde Park, London, is believed to be a corruption from the French *Route du Roi* (King's Drive).

AMERICANS PURCHASE ANNUALLY $5,000,000,000 worth of goods on the installment plan.

THE ENERGY USED in dancing the Charleston is equivalent to that used in running a 440-yard race.

SO LOW ARE ARMY salaries in France that officers in crack cavalry regiments and professors of the War College are working at menial labor to augment their income. Many are in dire want.

THE AVERAGE LIQUOR EXPENDITURE for every non-abstaining family in England last year was $175.

WHEN PERSIAN WOMEN walk abroad at night a servant carrying a primitive lantern precedes them through the unlighted streets, just as was done in medieval times.

DITCH DIGGERS, FACTORY hands, clerks and stenographers of Leningrad eat their meals from the tableware of the former Czar when they go on their frequent vacations to the 'Workers' Sanitoria,' established by the government.

AMERICAN FARMERS RAISE 12 tons of cereals for each man engaged in farm work. Farmers of the rest of the world raise only 1.4 tons for each man.

THE NUMBER OF CHURCH members in America increased 800,000 during 1925. Methodists led in the increase. There are now 46,883,000 church members out of a population of 116,000,000.

ABOUT FIFTY BILLION WORDS, more than half of which are of feminine origin, pass over telephones of the United States every twenty-four hours.

THE CONDOR IS NOT only the world's largest bird but is also the highest flier. It has been found flying at heights of more than four miles. Its young, however, cannot take to the air for twelve months after being hatched.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week deals with the useless elements in the discussion between 'humanitarianism' and 'humanism.'

Drugging for fat—that's what a lot of people are doing: doping themselves in the hope of growing thin. The real 'funnies' of the papers are the cosmetic and drug ads. There are folks who even believe a little pink pill will take the place of exercise. If they were only fooled out of their money, that would not be so bad, but they are actually harmed and poisoned by these anti-fat preparations. (p. 5)

Americans used to dread a mortgage as they did the poorhouse. It was the last confession of failure, something to turn to after everything else had failed. *This dread was an Anglo-Saxon heritage,* and it gave substance to the country. But nowadays mortgages are the fashion. A mortgage blanket covers the country. *We are mortgaged to one-half the national wealth.* There's something to think about! (p. 3)

John Alden pirated books—for the people. He thrived in the days before copyright laws were very strict, and he 'stole' books to reprint them in cheap editions and sell them by the thousand. Dr. Barton tells the story of this jolly pirate, who placed good literature in the hands of those who otherwise could not have afforded it, and who died a poor man because he passed his savings on to the public. (p. 15)

Then there is the other side of the book picture. Take the Reverend Dr. Charles M. Sheldon. More than 20,000,000 copies of *In His Steps* have been sold, yet Dr. Sheldon has received not one penny of real royalties from them. Seems unjust, but Dr. Sheldon himself makes no complaint. His is truly a remarkable story. (p. 2)

Adventure is everywhere; sometimes it lights on a city, sometimes on a mountain, sometimes on a placid farm. Here's a tale of adventure on a little rock in Lake Superior, where a fortune in silver was found. (p. 26)

But for the real thing in adventure, take American sea battles. The cruise of the frigate *Essex,* in the War of 1812, which roamed the South Pacific under Captain David Porter, is a true epic of the sea. (p. 19)

If you want to know a people's prosperity, visit their food markets. The dinner table is an unfailing gauge. So we go marketing with James Stevens among the green stalls of vegetable markets and the gleaming ice and fins of fish markets, and the spicy odors of grocery stores and the wheatloaf fragrance of the bakeries. Stevens knows well the signs of prosperity, for a few years ago he was a common laborer and the next meal often seemed far away. Now he is well known as a magazine writer and as the author of *Paul Bunyan,* a tale of the logging camps. (p. 16)

Americans are practical. And that is why America leads the scientific world in psychology. The fetish of supposed European superiority must go down before the cold facts of American progress in science. Dr. Donald Laird, noted psychologist and professor at Colgate University, explodes that old belief. (p. 4)

A few weeks ago we printed a series of articles on the negro from the viewpoint of the Southerner. They caused widespread comment. This week we have an interpretation of the negro *by a negro.* It will repay careful reading, for it is a record not only of what the black race has accomplished in its six decades of freedom, but of what the white race has done to help. The author is editor-in-chief of the Associated Negro Press. (p. 8)

Uncle Sam has made the tropics habitable. That in itself is an accomplishment secondary only to the building of the Panama Canal. Here is an article telling what the Government does—and has done—for its family in the Canal Zone. The jungle has virtually disappeared, and in its place are beautiful homes, golf courses, tennis courts, excellent schools, ice plants, club houses, a railroad, churches—everything, in fact, necessary for a model community. (p. 12)

An American soldier tells us what America's entrance into the League of Nations would mean *to Americans.* That's an angle many of our international-thinking enthusiasts conveniently overlook. They rhapsodize over the benefits *to the world* of having the United States bind itself to the League, but they neglect to state what the effect would be *on America.* (p. 7)

Then we have an analysis of school methods . . . and a little human-interest story (one you'll like) on the chalk artist of Palazzo Gallery in Florence.

And of course there are the regular departments, Editorials—one on the political outlook; Chats With Office Callers; I Read in the Papers, and Briefly Told. And the weekly dance article—this week some fundamental instruction on the position of the feet in dancing.

The mortgage situation is too comprehensive to be covered in one article. Next week we will discuss its latest phase, the real estate bond. There will be also many other features in the issue, including an article by Stanley High on the younger generation, and the fifth story of the Magellan series.

Dr. Sheldon's Book Sold in Millions But Left Its Author a Poor Man; He, However, Has No Regrets

Dr. Charles M. Sheldon, with thirty-six different editions of *In His Steps.*

# 'In His Steps' Brought No Wealth

By WILLIAM L. STIDGER

BETWEEN 1896 and 1925 more than 22,000,000 copies of *In His Steps* have been sold. Dr. Sheldon, the author, took me into a room in the beautiful new 'Charles M. Sheldon Community Hall,' of the Central Congregational Church, and there, lining the walls, were a dozen cases, each containing different editions of this remarkable book.

The room looks like a rainbow; some of these books, with their strangely colored jackets, were printed in Japan, some in China, some in Persia, some in South America, some in Europe. Some had jackets like dime novels of the wildest days of Jesse James and Nick Carter. One of these lurid jackets was put out on a penny edition in London and for the sensational subtitle: 'The Rescue of Loreen,' there was the picture of a man dragging a girl out of the gutter.

Said Dr. Sheldon, with a smile, when I pointed to this particular book: 'That was put out by a woman in London, who wrote me that she didn't quite like its theology so she had changed the words that came from the preacher's mouth to make them fit her own ideas. That was the funniest of all the experiences I have had with *In His Steps.*

'Incidentally,' said Dr. Sheldon, 'that particular book sold for a penny each. I bought several copies of my book, on the Strand in London, for a penny each. The book has been issued to sell for a penny a copy, and for ten cents a copy, and from that up to ten dollars a copy,' explained Dr. Sheldon; 'and with all of the twenty-two million copies *I have never received a penny of real royalty.*'

This certainly was an astonishing statement. Most persons would say offhand that *In His Steps,* with its millions of sales, had been a gold-mine for its author. Yet here was the author himself saying he had never received a penny of real royalty.

I have figured up what Dr. Sheldon's royalties would have been, if he had received only one cent a copy for every copy sold, and it came to $220,000. If it had been five cents a copy, which would have been a fair average, his share would have been $1,100,000. But instead of being a millionaire, Dr. Sheldon is still a poor man. In fact he has just received a commission to write an article for one of the largest circulated magazines in America on 'Why I Am Not Afraid of Being Poor.' He said to me, 'Why should I be afraid of poverty when I have lived intimately with poverty for sixty-five years?'

'Why did you write the book to begin with?' I asked this kindly eyed man with the stubby, gray mustache.

'I wrote it because I wanted something bright and attractive to hold my young people for the Sunday evening service, and I read the book, chapter by chapter to my Sunday evening audience.'

A small church paper in Chicago purchased the serial rights to the story and started serial publication. Instead of sending *two* copies of the publication to the Copyright Bureau in Washington, they sent only *one* copy. Another error was in sending the first editions of the story to Washington in a volume that did not contain all the story but only a part of it. These two blunders made it impossible to secure a copyright for the author, with the result that the one book which has sold more copies than any other novel ever written in America has netted the author nothing in the way of royalties.

'How many copies of the book have been printed and sold in America alone?' I asked him as we sat in his study in Topeka.

'Over eight million copies have been sold by American publishers alone.'

'Have any publishers ever voluntarily given you any money?'

'Yes, in recent years through the efforts of Ralph Waldo Trine, who asked my permission to go to publishers who had made fortunes on my book, Grossett and Dunlap sent me a check for $1,000 for one hundred thousand copies, although they were not legally bound to do so. Henry Altemus sent me a check for $150.

'I also got a small check from a London company which has put out the book in penny editions. But all told I have not received two thousand dollars from the book.'

'Do you feel this an injustice?'

'It's all right. I am happy. I have had a glorious ministry. I have a happy home. I have been given every liberty by my people to do my work and to pioneer new trails and new methods. They have not held me back. I have had health and a beautiful wife to make the way pleasant. Perhaps it is better as it has been. I choose to think so.

'It would have been a strange thing and an incongruous thing for a preacher to write a story about what Jesus would do if He were here and then make a million dollars from the sale of his book. I also comfort myself in believing that the fact that it had no copyright has also increased its circulation. Companies that (Concluded on page 30)

# The Mortgage Blanket on the U. S.

## Urge to Borrow Outruns Inclination to Buy and Mortgages Are Increasing

By AARON HARDY ULM

ILLUSTRATED BY W. W. CLARKE

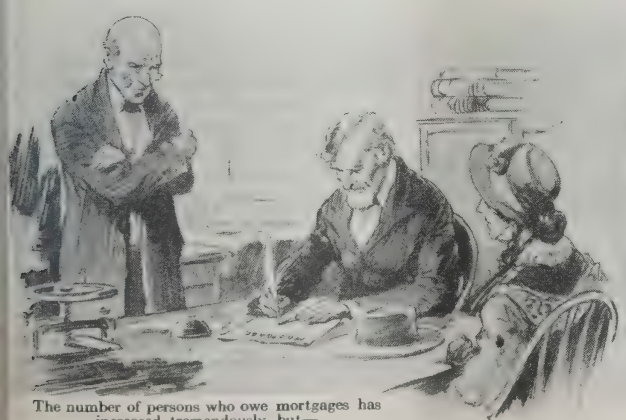
EVERYONE is familiar with the plot, one that rarely fails the writer of story or play. The villain holds the mortgage; the owner of the home, farm or business cannot meet the interest or principal when due. The villain stands on his legal rights and gets what he wants—be it the hand of the girl, the crushing of a competitor, mere revenge, or only the property—unless the hero, with cash in hand, arrives in the nick of time and saves the situation.

Thus is reflected traditional Anglo-Saxon fear of mortgages. It runs through the literature of the race, from Chaucer to St. John Ervine.

Yet the theme no doubt is exaggerated in stories and plays. For a mortgage is sometimes a means to a happy end, as when it aids in buying a home or financing a business that succeeds. And mortgage holders—though rated, not without warrant, as the most hard-hearted of creditors, who throw poor widows into the street or boot sick men off farms or out of stores—are exceptions in real life.

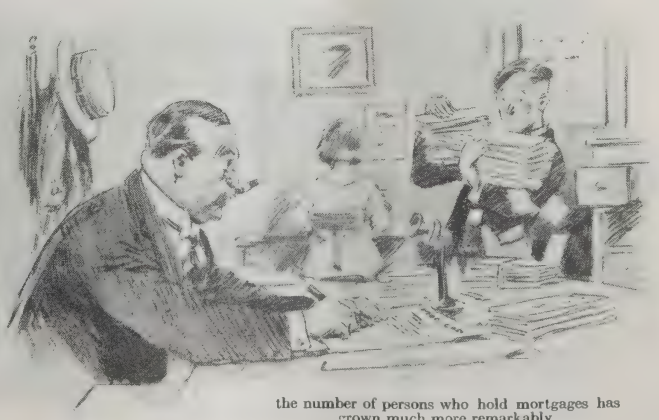
Moreover, the 'villain' may be on the other side. That is, the one who takes advantage of the poor widow or the man in distress can be an 'ower' instead of only the owner of a mortgage. This is particularly true now.

There seems to be under way a change in the entire setting of the instrument which imaginative writers have ranked—as a device for picturing callous cupidity—with the ancient symbol of the ubiquitous pawnbroker.



'He owns a lot of mortgages,' used to be the highest assurance as to one's financial security. Conversely, 'everything he owns is mortgaged to the limit' was the extreme expression of doubt and sometimes pity.

Now, owners of mortgages may be as deserving of solicitude as owers. The number of persons who owe mortgages has increased tremendously, but the number of those who hold them has grown much more remarkably.



These changes have run along with phenomenal growth and expansion of the mortgaging practice and of new methods by which this is made possible. The sum of all is among the forefront phenomena of the times.

The development has been so rapid that any figures relating to it which can be presented are far from complete. Some, however, are illustrative. A concern that carries on a nation-wide traffic in 'mortgage paper' says in a recent advertisement that 'in 1925 city real estate bonds purchased by investors was close to one billion dollars.' A more authoritative estimate is seven hundred million dollars.

'Real estate bond' is one of many new, or newly popularized, synonyms for mortgage. It is stated authentically that in 1919 only $50,000,000 worth of real estate bonds *(Continued on page 22)*

The number of persons who owe mortgages has increased tremendously, but—

the number of persons who hold mortgages has grown much more remarkably.

# America Leads the World in Psychology

## European Authority Destroyed by Practical American Laboratory Methods

By DONALD A. LAIRD

A PSYCHOLOGIST who had for years been connected with a European university laboratory visited the Colgate Psychological Laboratory last summer. He had been in America before, and had returned to take a position in a small mid-western college.

The Continental university with which he had been associated for years has six centuries of scholastic tradition and is known wherever educators gather. The American college to which he came is scarcely known outside the local county.

This scientific worker knew all this. I inquired of him why, at the age of 45 years and with an international reputation as a scientist, he had made what appeared to be a downward step.

'Downward step!' he exclaimed. 'My dear fellow. In fame only does this appear to be a downward step. It is really one of the greatest upward steps I have taken. I shall rank it next in importance to my decision, twenty-three years ago, to enter scientific work rather than military life, as my fathers had done.

'Even in this small—what did you say? mid-western—college, I am able to do much more experimental work than on the Continent. The trustees are more generous in allowing me funds for research, the students thrill to the experiments of the laboratory rather than being buried in classics, my colleagues are coöperative and not acting upon selfish and petty jealousies.

'Downward step? Shame on you for thinking of your America that way!'

* * *

So we sat on the sun porch, sipping the heavy black coffee of which my friend is inordinately fond, and made comparisons of the way our science had been advanced in America and abroad. I confessed astonishment as we cataloged discovery after discovery.

My own position was rather incongruous: I, a native American, born of a long line of native Americans, was trying to convince a foreign scholar that other countries had contributed more to psychological advance than had mine. But, having once made a thoroughgoing inventory of progress, never again shall I be on that side of the fence unless overnight the whole situation changes, and I know enough of America's psychological workers to have every confidence that the lead will not be relinquished.

The first psychological laboratory was established at the University of Leipzig by Wilhelm Wundt late in the 19th Century. Compared with the field of psychology at present, this was little more than an abortive department of physiology. But Wundt himself was soon to ramble off, unrestrained, into the most abstruse and impossible fields in which he seemed to forget that he had a laboratory. Like old people whose memories fail, he called upon imagination and conjecture to supply him with material with which to write book after book.

One of our most venerable American psychologists is still chided at times because he may have contributed to Wundt's voluminous books which have not been verified, and which in most cases, by their very nature, can never be verified. This American psychologist, it seems, took one of the first typewriters manufactured into Germany and presented it to Wundt. Thus could he write two books where only one had grown before. Thus could he produce two books to be used for a decade or more as authoritative because of a certain prestige, only to become dust-covered and unread except by those in quest of exhibits for a psychological chamber of horrors.

With the writings of William James, one of America's first psychologists, the case is entirely different. Going from physiology into the field of psychology he became the first head of the department at Harvard. His books, in some cases written thirty years ago, are still widely used, and I have been told by publishers are still best sellers.

An emphasis upon *useful* psychology has been one of the characteristics of American contributions to psychological advance. True, there are a number of our workers in this field who try to remain (Concluded on page 31)

Dr. Snow's work with the Chicago Yellow Cab Company has resulted in a one-third reduction in accidents for that company. Dr. Watson is famous as an energetic proponent of behaviorism in psychology. Dr. Cattell was one of the first experimental psychologists in the United States.

# The Dangers of Drugging for Fat

## Desire to Be Slender Makes American Women Lose Health and Fortune

She left one of the capsules on her desk. Her assistant thought she saw the capsule move.

By H. H. DUNN

ILLUSTRATED BY J. C. GRAHAM

A MIDDLE-AGED woman, an office manager for a large corporation in Vancouver, recently found her weight increasing to a point where she decided, as many women have, that she was 'too fat.' Instead of consulting a reputable local physician, she answered the advertisement of an American 'obesity specialist,' who averred that a capsule a day keeps the fat away. Without waiting for the second letter from this 'specialist,' which would have given her a reduced price, or for the third, which probably would have cut the rate still more, Miss Vancouver sent the equivalent of ten dollars, for which she received a box of twenty-one rather large capsules, completely filled with a yellowish composition, apparently moist and solid.

These were to furnish 'treatment' for a week, one capsule to be swallowed before each meal. Quite inadvertently she left one of the capsules on her desk, after she had taken half a dozen of them. Her assistant, standing beside that desk just before lunch, thought she saw the capsule move. A longer glance assured her that it did move. She called her superior's attention to the mystery. The capsule was opened and found to contain, buried in a gelatinous compound, a small but very active worm. Other capsules from the package were opened, revealing a similar worm in each. Laboratory investigation showed that all the capsules were similarly filled with crawlers and that each of these worms was a very young intestinal parasite.

On advice of her employer, the woman wrote to the anti-fat concern, and by return mail received the explanation that the 'worms must have developed within the preparation,' and the further offer of five hundred dollars and complete free treatment for her silence. Meanwhile, two other 'treatments' were ordered by other persons. These when received and examined revealed the same living 'remedy' in each capsule. Action was taken against the 'obesity specialist' and he was fined, given a prison sentence, and for the time being put out of business. Six months of steady treatment by a local physician were required to relieve the woman of the worms she had taken in her first doses of the anti-fat capsules. Doubtless this sort of remedy would reduce corpulence—and also result in the death of the person taking it.

Probably the movement of the worm within the capsule was caused by the unusual heat of the sun's rays, falling through a window as the pellet lay on the victim's desk. Except for this fortuitous accident, the disaster which inevitably would have overtaken this woman would not have been averted, and the anti-fat fakers would have had to their discredit another death. Terrible as is this example of the work of the swindlers in one department of medicine, it is the only incident on record in which internal parasites have been introduced into the human body as a 'cure' for obesity. Yet the medical associations of the several states and the American Medical Association in the past ten years have exposed more than 500 men and women as distributors of absolutely worthless and often harmful alleged remedies for corpulence, or plain 'fat,' as one prefers to call it.

It is virtually certain that not one of the advertised 'fat cures' of today will reduce the overweight of man or woman; it is positively established that any one of these 'remedies' can be obtained at the corner drugstore for less than fifteen per cent of its cost as sold by the swindlers; and in more than eighty per cent of the so-called remedies which have been analyzed and their purveyors exposed, some of the ingredients are harmful. Not a few of them are actually and actively dangerous to health and even to life itself. Without exception, the hundreds of 'fat cures' so far examined are offered at several prices, ranging from the first and highest, usually $10 for a treatment, down to as low as $1.50 for the same treatment. These successive prices are offered when the 'sucker' does not bite at the advertised price or the other and later prices offered in the 'come-on' letters which follow the first intimation from the 'prospect' that he or she considers himself or herself too fat. This variation in the cost of the 'remedy' in itself should indicate to the interested man or woman that the cure is not so sure as it might be, otherwise such varied lures would not be necessary.

The desire to be slender causes thousands of American women—particularly those who lead comfortable, sheltered and leisurely lives—to throw away millions of dollars annually on these 'cures.' Virtually all of these so-called remedies are sold under two claims: First, that the patients need not diet; and second, that they need not exercise. In the early days of this fraud, an extract of the thyroid gland—inactivity of which is one of the causes of obesity—was used by these anti-fat fakers, but this extract is so powerful and so dangerous when administered without proper study of the individual patient, that it has been abandoned by the great majority of them. Vinegar, lemon juice, bladderwrack, pokeberry, ordinary orange peel, and a score of other tart or bitter tasting extracts are being used, none of them of any value in reducing fat.

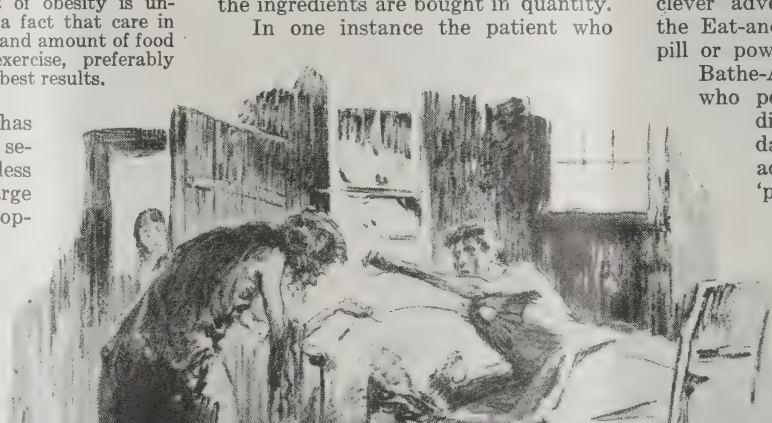
The great gain in the fads of mental, religious and other forms of drugless quackery has led the anti-fat fakers into this field. You may now pay your good money to have your corpulence prayed off your bones, or even wished off them by the mental healer, without taking either medicine or exercise or paying any attention whatever to your diet, though doubtless it would be beneficial if one prayed over his potatoes, spaghetti or other starchy foods.

The simple truth of the matter is that *those who eat a great deal and take very little exercise are extremely likely to become obese, particularly as middle age comes on. No treatment which ignores the cause of a condition in the human body ever has been effective in removing that condition except in the rare fortuity of accident.* Even in the hands of the most skilled and most reputable of physicians, the treatment of obesity with drugs is not successful, save in rare cases. At best drugs intended for the reduction of weight, or the removal of fat, never should be administered except by the best physician obtainable, who has had the opportunity and time to study carefully the particular condition of the individual involved, for, possibly more than any other, the causes of obesity vary with the individual, that is to say, hardly two persons become fat from the same cause. Certainly no blanket treatment for hundreds, and even thousands, of the corpulent can be effective with any noticeable number of them.

The American Medical Association, in its highly interesting description of the fat fakers who have been exposed, says:

'There are few diseases which the physician is called on to treat in which it is so vitally important to adapt the treatment to special cases as in obesity; and even then, the treatment must be varied from day to day in response to indications as they arise.'

The same authority adds:



'While it must be admitted that in some instances the treatment of obesity is unsatisfactory, it remains a fact that care in the selection of the kind and amount of food eaten, together with exercise, preferably in the open air, offer the best results.

More recently, it has been found that the secretions of the ductless glands have a very large influence on the development and retention of fat by the human body, and excellent results are being attained by the use of the ex tracts of some of these glands in individual cases of excessive obesity. Mail-order administration of such extracts, however, will hardly be considered seriously by the corpulent man or woman who thinks, even though he or she does not wait to reason out the conditions under which the anti-fat faker operates.

We laugh superciliously at witchcraft, and think with pity of the days when the dried bodies of the newt and the salamander were sovereign medicines, yet hundreds of thousands of us pay our hard-earned money every year for 'remedies' equally ridiculous, and our newspapers accept and publish advertising heralding 'cures' as baseless as any Mesmer ever claimed. Take the celebrated fat cure, for which a well-known motion picture actress was put out of business in California, though she is now engaged in other lines in New York. This 'remedy' contained, to the quart, one pound of powdered alum, ten ounces of alcohol, and sufficient water to fill up the measure. The approximate cost of these materials, according to the analytical chemists who made the tests was thirty cents, though due to the increase in the price of alcohol it may be as high as one dollar today, with an added five cents for the bottle. The price of this 'remedy' was $20, payable in advance, a profit of $18.95, or about 1800 per cent.

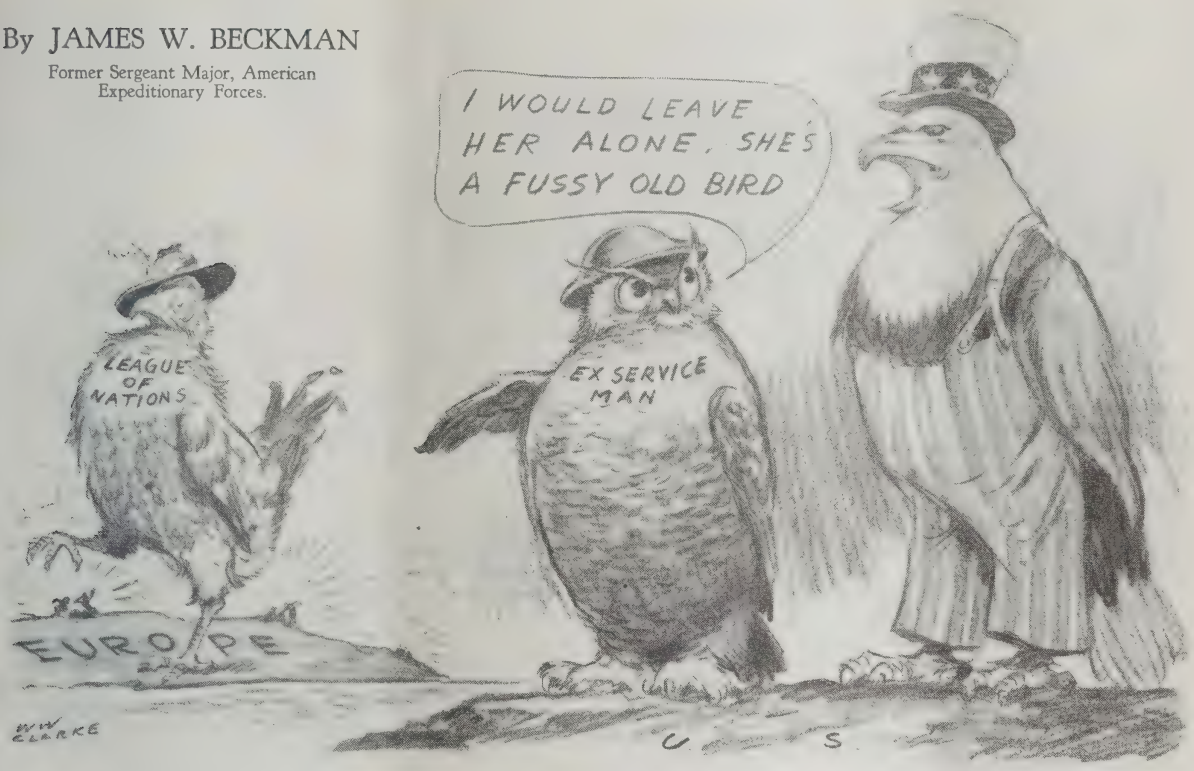
Another tablet, which still has a wide sale, contains boric acid, corn starch, milk sugar, water and a dash of flavoring extract. These ingredients are as worthless in the treatment of obesity, as they are harmless to the patient, offering one of the examples of the 'fat cure' which at least does not injure the purchaser. Still another fat fraud, still going strong among women who should know better, consists of pink powders, to be dissolved in water. By careful analysis it has been found that these powders contain nothing but sugar, tartaric acid and baking soda, with a dash of coloring matter, probably harmless, to give the powder a pink tinge. The approximate cost of the one-dollar box of this 'remedy' is seven cents, probably considerably less when the ingredients are bought in quantity.

In one instance the patient who sent ten dollars for a ten-day fat-reduction treatment received in return a package containing 30 pink pills of large size and an equal number of brown tablets, with instructions to take one of each before each meal. On analysis, the pink pills proved to contain red-pepper, menthol and some vegetable extract, probably gentian. The brown tablets were simply the old-type compound cathartic pill put up in a different shape. The complete cost of the 'remedy' for which ten dollars had been paid was not more than two dollars, including ingredients, labor, package and postage.

We laugh at witchcraft, yet pay our money for 'remedies' equally ridiculous.

The advertising of these nostrums is directed largely to women readers. Men seem to accept the corpulence of advancing years with greater equanimity than women, and the 'sucker list' of these 'anti-fat specialists' who have been subjected to investigation by the governments of this nation and the various states, as well as by the American Medical Association, contain the names of women and men in about the proportions of five to one. These 'sucker lists,' containing the names of thousands of persons who are known to buy the necessities, as well as the luxuries, of life by mail, are obtained by the anti-fat specialists from five sources—employes of large mail-order houses, unscrupulous physicians, professional 'sucker listers' of whom there generally are several in every large community, other 'specialists' in other lines of mail-order medicine, and from victims who think they have been benefited and, in return for free treatment, turn in the names of their corpulent neighbors and acquaintances.

The 'cures' offered by the obesity specialists, however, are not confined to internal medication. Under the clever advertising of some of these, the Eat-and-Grow-Thin slogan of the pill or powder merchant becomes the Bathe-Away-the-Fat of the one who peddles soluble salts to be dissolved in the tub on Saturday night, or more frequently, according to the habits of the 'patient.' A typical one of these consists of small quantities of Epsom salts, camphor, alum, soda and citric acid. The soda and the acid are put in to make the mixture effervesce when thrown into water, and that is all they do or can do.



The application of alum, salts and camphor, separately or together, in small quantities to the exterior surfaces of the human body, can and do have no effect whatever in reducing obesity. It is possible that the frequent hot baths which the patient might take in using this 'remedy' would have some slight effect on the fatty tissues, but unless a rigid diet were followed, and consistent, persistent exercises indulged in, long-continued experiments have shown that no beneficial results follow this treatment.

Most of the 'bath-reducers' offered by these obesity re- (Concluded on page 18)

# If Not America First—Who?

## A Soldier's View of the League of Nations

By JAMES W. BECKMAN
Former Sergeant Major, American Expeditionary Forces.

IF WE were in the League of Nations now, it seems difficult to imagine how we should be free from embarrassment in any direction we moved. We may be criticized for thinking first of America, but if we were to substitute the welfare of any other nation for our concern for the welfare of our own, which country shall it be? If the answer is, 'No country, but humanity,' the question comes, 'How can America better serve humanity than just by being itself?'

Americans should differentiate between idealistic and practical appeals. In spite of all the 'idealistic' talk about our joining the League of Nations, there are a few practical facts that should not be ignored by those affected with too great a willingness to believe.

First, this country was founded by people of many nations who had escaped from European feudalism which meant constant warfare with their neighbor nations. They wanted a new country with no traditional feuds, where they could build life on a new basis of freedom, democracy and peace. These nationals and their descendants are the people who make America today.

To join the League of Nations would mean that we must officiate in the disputes of all old-world nations whenever they should arise. With a background of ancient injustices on all sides of every European controversy, how should we hope to make just decisions? Can Europe's long roll of wrong be settled by decisions, or must it settle itself by expiation? Could Americans bring to this unsolvable chaos the wisdom that would reduce it to order, without themselves falling partisans of the spirit of disorder?

Why should it be thought unreasonable or impossible for an American of Italian descent to sympathize with Italy as against France, Germany, Great Britain, or any other nation, and likewise with Americans of every other descent?

The proposal amounts simply to this, that we bring over to America the undesirable luggage that the hardy people who founded America left behind.

So far from insuring world unity, the present League of Nations would be more likely to mean American disintegration because of its appeal to the various elements in America, who are harmonious enough on American matters, but still divided as regards Europe. This is a possibility to be seriously considered.

In the League as it is proposed today and in the World Court, the British Empire would have six votes. The United States would rank with the smallest of the nations of the world. As we stand today, America represents the balance of power; she does not have to vote to make her influence felt. Under present circumstances, those nations of Europe who want our support, moral or otherwise, are under obligations to come up to American ideals of fairness if they want American sympathy or support. By submerging our influence in the League, this powerful position of America for good would be undermined and overcome. We should then be a party to quarrels, whether we wished or not, with the result that our present neutrality in political squabbles would be lost.

I am writing as a soldier when I say that American (*Concluded on page 30*)

# Sixty Years of Negro Freedom in America

## 'We Negroes Have a Definite Part to Perform; Our Responsibilities Have Increased'

By NAHUM DANIEL BRASCHER

Life travels; only death is still.
Time measures periods; never Life.
Life is eternal.
The violet, the lily of the valley
and the rose are messengers of Life—
they serve, bring happiness and
silently tell the beautiful story of LOVE.
LIFE is spirit finding expression in Service—
the grand opportunity of existence.
Distance is no barrier
to Life's instant journey for Service.
In the twinkling of an eye, like the
sweetness of the violet, the lily of the valley,
and the rose, Life travels on the wings of
Love,
salutes for duty and acts!
'Life Is Real.' The secret of Life's
Happiness
is SERVICE; the supreme joy of Life is
LOVE.

—*N. D. B.*

THERE is an event in American negro life that is at once unique and interesting. It is known as the 'Emancipation Celebration.' It is an annual holiday and jubilee occasion marking the anniversary of the abolition of slavery. The preliminary Emancipation Proclamation was issued by President Lincoln on September 22, 1864, and the final proclamation on January 1, 1865.

There have been sixty years of negro freedom in America. What have we done with those years?

There has been developed among us an element that frowns on the 'celebration of freedom.' This element is divided into two sections: those who wish to forget that their forbears were in slavery; and the other, smaller but more militant section, feeling that American racial conditions are such that there is nothing to 'celebrate.'

The same element not favoring the 'Emancipation Celebrations' likewise does not favor the singing of negro spirituals, or plantation melodies. The majority, I think, believe in both, and in this instance I am with the majority. We have much to commemorate; we have much for which to be thankful.

Examine more closely the subject of spirituals—for they are indissolubly interwoven with the dark days of slavery. They were the deepest expressions of burdened souls; they were the musical longings of a better day; they were, at times, the hallelujahs of spirits unfettered by bondage. The rich harmonies of those old songs are tuned to the music of heaven. The words may be crude but the message of eternity is in them. They grip the heartstrings.

In recent months I have visited negro schools throughout the South; in all of them these songs are used with amazing effect. There are in the North a number of musical societies devoted to the preservation of these unusual songs. If a person can hear them and not be touched by their melody and pathos, he has a heart of stone.

It is my firm opinion that, among other things, music will again become one of the redeeming forces of negro opportunity in America. Music is the magic that opens doors where reason will not. It is well known that most of the popular music of America today is based on negro themes. Some of it is good, and some of it is very bad, but it has caught the fancy of a certain element of the present-day American mind.

This music is not all vocal, by any means. Some of the finest bands and orchestras in America are entirely negro. In the days of slavery we had the banjo, fiddle, tambourine and bones,

and there are today few musical organizations of any group that do not have these musical—or noise-making—instruments in one form or another.

There were 4,000,000 negroes in America when the Proclamation was issued; there are nearly 15,000,000 today. How 4,000,000 without education or resources could be turned free into the surging stream of American life and arrive at the port of progress attained in this year of Our Lord, is nothing less than a miracle. There were two conflicting states of mind that both helped and hindered the situation, following the days of freedom. First, there was much hatred between the North and the South. There had been four years of conflict. Thousands of Northerners lay in unmarked graves, brought to their sad end by rebel shot and shell.

In the political turn of events, a number of things were done for 'spite,' and 'revenge.'

Then, there was a great tide of sympathy 'for the poor and unfortunate black people,' which found its outlet in charity and paternalistic assistance. Cultured men and women out of the best homes of the North left their all and went down to the war-stricken regions of the South to teach in 'Freedmen's Schools' that were being established everywhere by various forms of philanthropy mostly through religious organizations. Many of these schools are still in existence; and many of them still have white teachers, whose hair is silvered and whose cheeks are wrinkled by the hand of time. They have given their lives unselfishly for negro development.

In the North, for the most part, the negro was wel-

# MR. FORD'S PAGE

ONE of the truths we have learned of recent years, although in a sense it has always been known, is that nothing is true until it has been realized through all the planes of life, from highest to lowest. What is highest and what lowest is not agreed upon; men's views of this are largely influenced by the pressure and necessity of the moment.

Just now many important-sounding things are being said of the motives and methods of human progress. We are told, by some younger theorists, that what they call 'sentimental humanitarianism' must give way to what they call 'scientific humanism.' They seem to believe they are waging a campaign for something that could not arrive without their help. A little more experience and they will understand that they are merely stating the method of progress; they are describing what comes to pass even though they be silent.

Sentimental humanitarianism, by which is meant doing right because one *feels* that it is right or because one is moved by a sense of *human pity* and kinship, and scientific humanism, by which is meant doing what the known laws of human relationships declare to be the only course that will stand, are not two opposed methods. We cannot discard one in favor of the other. They are different stages of growth of the same thing. It begins in emotion, it ends in knowledge.

As to the values of these two, it is impossible to place one above the other. Those who want mankind to do their good and right acts as cold-bloodedly as selfish and calculating men do their bad and wrong acts fail utterly to see that they could never have arrived at the point of making that suggestion unless humanity had first made an emotional beginning on the course which they seek to bring to a rational or scientific completion.

This can be illustrated by several well-known developments. There are historians who tell us that the abolition of slavery was purely an economic act, whose motive was one of dollars and cents. Yet everyone knows that public attention was not called to the question until people who felt sorry for the negro, and whose moral sense was outraged by the holding of human beings as purchasable and salable property, began to vent their emotions in the name of right and wrong. John Woolman and John Brown and *Uncle Tom's Cabin* were not in the least economic.

*WHATEVER is felt to be right morally is found to be right through all human relations: it is right physically and politically and economically. It is, however, on the moral and humanitarian side that the right thing is first perceived. It is seldom first perceived as economically right; that comes later. Theorists contend that the economic impulse comes first; but experience shows that it comes last and establishes in practical ways what the moral perception saw. They are both degrees of the same movement; the moral is more sensitively perceptive; the economic is more materially constructive. Neither can afford to belittle the other.*

Take prohibition as another example. It is now admitted everywhere that the licensed liquor traffic was a terrible drain on the nation and was therefore an economic fallacy. But there are men who tell us today that prohibition came as an economic movement. This is to ignore the generations of women who waged emotional and moral war against the monstrous immorality of the business, until they literally forced the nation to consider its economic aspect also. It is true that in the latter stages of both the anti-slavery and anti-liquor agitations, 'scientific humanism' and its methods supplanted 'sentimental humanitarianism' and its methods, but the latter was the army of advance and conquest which prepared the way for the former.

The 'scientific humanists' are never the first to feel the existence of wrong in a system. That is felt by more sensitive souls. Long before the wrong can be indicted from every side, even before a rational reason can be given for believing it to be a wrong, it is *felt* to be such by the humanitarianly minded, and upon that feeling the war against it is launched. Most of our 'scientific humanists' are busily engaged in letting well enough alone, in seeking to establish society on the incomplete knowledge now at hand. And they will continue their somewhat cold and usually static existence, until the labors of the 'sentimental humanitarians' bring them new reforms to rationalize.

Because a fact has economic bearings—and all facts have—it is not therefore necessarily an exclusively economic fact. Because a reform has economic relations—and all reforms have—it does not follow that the economic motive is responsible for it. What is morally wrong is economically wrong, but the moral wrong is seen first. What is morally right is economically practicable, but the moral aspect, in the vast majority of instances, is seen first. The movement toward a higher plane requires the moral judgment to start it, and the economic judgment to complete it. They are in extremely bad business when they sneer at each other.

Sentiment is usually right. It may not know why. It may not be able to suggest the machinery whereby society may adopt the better way. But it does agitate and persuade until, finally, the unsentimental mind steps in to make practical what was only visionary. The visionary may be just as true as the actual, but the vision is certainly precedent and indispensable to the actual.

## The Political Outlook

IT LOOKS like an active year in politics. Regular Republicanism is meeting unexpected opposition, which yet might have been expected if politicians possessed any knowledge of the public. The defeat of McKinley in Illinois, of Pepper in Pennsylvania, of Stanfield in Oregon, all of them men of character and ability, discloses a dissatisfaction which is indisputably present, even if its causes and content are not yet clear. And it promises to be a year of unusual political interest.

Many elements may be recognized in the dissatisfaction. Doubtless the Administration attitude on the World Court is at odds with the nation's attitude on the same question. The people also feel that there has been a good deal of official insincerity and willful bungling on the prohibition question. Politicians keep prophesying that prohibition will be an issue in the campaign. They are mistaken unless they mean that the enforcement of prohibition is a demand which the people will make in the campaign.

But perhaps the chief source of dissatisfaction throughout the country is the subtle and uneasy sense of the people that the country has come under strong corporation influence, that the Government has almost entirely succumbed to financial control. This in no sordid sense; no one has been bought or sold. But when the foreign policies of the Administration are dictated by one financier and the domestic policies of the nation by another financier, neither of whom has ever conceived a progressive thought, the people are quick to sense it. They may not know who the financier-foreign adviser of the President is; they may know the name of the other financier, but may not guess the extent to which he runs things at Washington; yet they feel creeping through the veins of the nation an element which is not warm to the popular heart.

We wanted and needed a business administration in this country. We wanted conservatism of the progressive sort. We wanted a cessation of government interference in business. But what we have got instead of a business administration is a corporation administration, which is not the same thing. And what we have got instead of progressive conservatism is a most amazing reactionism. And the cessation of government interference in business has had but one effect, to loose the most lawless elements of American business upon a career of exploitation, criminal in its recklessness, for which the country cannot possibly escape dear payment.

Now, these are the things present, but largely inarticulate as yet, among the people. He is no friend of President Coolidge who would mislead him by silence on this point. Certain influences have been built into our Government whose effects, now ripening, are resented by the people. And what has begun at the polls is nothing to what will come unless the popular will in government is somehow substituted for the coterie-will in government.

These are the things which men around the President are saying, but not to him. And somebody should say it to him, unless, as it may easily be, the President is proceeding upon the assumption that the financiers are the real rulers of the country and therefore the safest advisers of the Government. If this is the President's opinion, he is so wrong that the national reaction against such a position may sweep his party from power.

---

## The Motor Car and Society

IT WAS said in England that the automobile had made forever impossible the success of a general strike which represented the attempt of a class to hold up all the people. The automobile means a wider range for individuals than is possible on foot. They can draw upon more territory; they have the advantage of more human contacts; they can pack into little time a great deal of fruitful activity; and this mobility and 'cruising radius,' so to speak, is of inestimable value to a population threatened with economic blockade.

Of similar tenor is the complaint of socialist leaders in the United States that attendance upon socialist meetings is suffering a great falling off because socialists are too busy riding in automobiles with their families, or sitting at home listening to the radio. It is an unconscious confession of the power of economic plenty to satisfy the restlessness of progressive natures. And lest this should seem like the throwing of a sop, like drugging social aspirations with material supply, let it be said that the presence of a plentiful material supply indicates as nothing else can that the social conditions which the best socialistic minds have desired are coming by the way of modern production and management. The first requisite of social well-being is the production of wealth, and this means industry and manage-

ment. If young socialists are out riding in their motor cars, or at home listening to the radio, it is an excellent thing. It indicates that the irritation of life no longer has its center for them in economic matters, but that they are economically free to enjoy the other and higher aspects of life.

## *Rights and Duties*

THE Supreme Court of the United States has refused to declare unconstitutional the action of residents to protect their neighborhoods from undesirable invasions. The case in question was the protest of certain Washington property owners against the sale of a nearby residence to a negro purchaser. Much interest and some resentment will be caused by the decision. On the whole, however, it will be found that negroes will be wisely guided in not insisting upon raising the question generally. Legally, there are certain rights beyond question, but we are not living in a legal vacuum; we are living in the midst of many mingled circumstances, and we must always recognize the practical tendency as itself a part of social law. Many lamentable things have followed invasions of neighborhood, often with motives that would not bear scrutiny. On the other hand, respectable colored families do not find it difficult to obtain suitable residences within their rights and also within the limits of racial good will. These are matters which are better conducted according to the dictates of common sense than according to high notions of 'rights.' Rights are always checked and balanced by duties.

## *Give Them Work*

THE man in prison should have a job. No punishment is so cruel as compulsory idleness. Yet prison work should not be used to further degrade the convict. It should be made a means to his self-support, and then a means to the support of his family if he has one. In few places is society more cruel than when, in sentencing a criminal to prison, it also sentences his family to starvation. Let him be made to support his family by his prison labor. Let prison management be of such a high quality that he can support them. And it would be well to go even a step further; in property crimes, let the convict's labor restore the value stolen and unrecovered, and the cost of his infraction of social order. And where his crime has deprived another family of its breadwinner, let his labor be used to repair that economic destruction also. Men should be made to give economic reparation for their crimes, but in order to do this they should be given economic evaluation as prisoners of society.

## *The Prince's English*

THE Prince of Wales, so it seems, is manhandling the King's English.

'He has a marked Cockney voice,' laments St. John Ervine in a plea for pure pronunciation, 'and says "howpe" when he means "hope."' Nor is this all. He drops his r's.

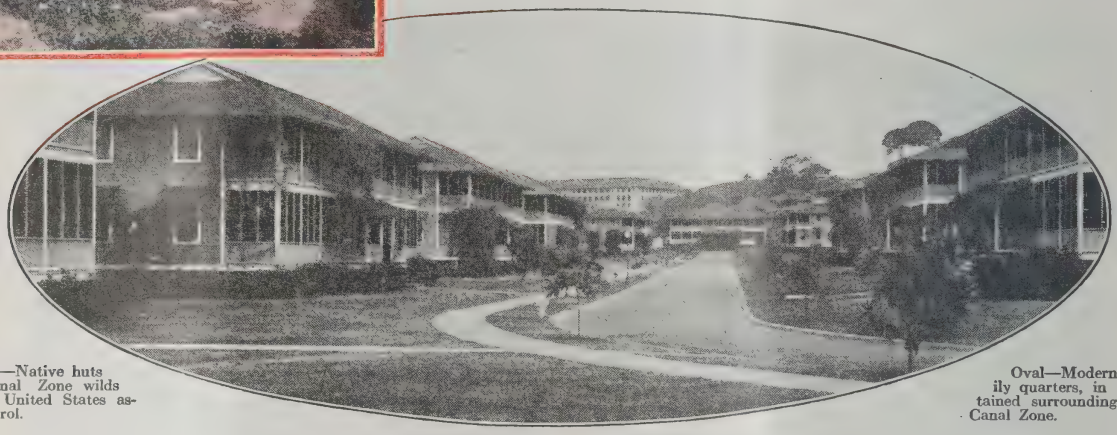
The playwright continues his criticism to include other members of the Royal Family: 'One of his brothers, lately broadcasting, referred to his elder brother as the "Dooka Yawk."'

Now this is a serious matter, one not to be passed lightly over. In commiseration for our cousins across the sea we will not exultantly offer it as proof of our contention that Americans speak better English than do the English. Nor will we urge it as an argument for the republican form of government.

Knowing how deeply the English temperament will be cut by the dashed thing, we will merely call their attention to that fine old saying of Shakespeare: 'Here will be an old abusing of God's patience and the King's English.'

## *Chicago's Shame*

CHICAGO has been brought very low before the country. 'From the sole of the foot even to the head, there is no soundness in it; but wounds and bruises and putrefying sores; they have not been closed, neither bound up, neither mollified with ointment.' The liberty to commit crime is a concession sold to all bidders, and machinery to punish crime is neutralized by bribes. More criminal than the so-called 'criminal classes' are those official classes that have licensed the practice of theft and murder as a state licenses the practice of medicine.



The strangest element in it all, to outsiders, is the calm with which these stupendous revelations have been received by the city whose honor they drag so low. Mysteries involving officials still remain mysteries. There are 'gangs' in city government which correspond to gangs in the criminal world, and which war upon one another, and the citizens seem to possess no machinery to penetrate and destroy the massed corruption.

The people of this country used to think that the days of municipal corruption lay behind us, that nothing could again occur as bad as New York was twenty-five years ago. But New York was a quiet village of pikers compared with the official criminality of modern Chicago. And with successive disclosures, the same 'gangs' remain in control. Only one thing is worse than the actual crimes exposed, and that is the moral apathy of John Citizen.

# Uncle Sam's Big Tropical Family

## Panama Canal Zone Now Holds Community Enjoying Latest Civilized Comforts

Upper Left—Native huts in the Canal Zone wilds when the United States assumed control.

Oval—Modern four-family quarters, in well-maintained surroundings, Balboa, Canal Zone.

By DAVID G. WYLIE

HOW big is Uncle Sam's family? In the Canal Zone territory, ten miles wide and forty-eight miles long, there are three thousand white employes and nine thousand colored, mostly West Indian; also about ten thousand soldiers and sailors. The Canal is strongly fortified, both at the Atlantic and at the Pacific ends. There are numerous army and military posts in the Zone—Clayton, Davis, Corozal, Randolph, Sherman, de Lesseps, Gatun, Empire, Quarry Heights. There is a radio naval station at Darien and Amador. The Army Aviation Post is at France Field and the Submarine Base and Naval Air Station at Coco Solo. What is Uncle Sam doing for this big family in the Canal Zone?

The colored people are called 'silver' employes and the white people 'gold' employes. There are cottages for one family, two families and four families. The accommodations are ample and comfortable. All the buildings are carefully screened, excellent water from Gatun Lake, that has passed through purifying stations, electric light, and telephones are furnished. Some of the houses are built on wooden posts and others on concrete and many of them are covered over with Bougainvillea that resembles crimson rambler. The houses are also furnished at Government expense.

For several years the houses were furnished free of rent but now there is a moderate charge. One gentleman who lives in a comfortable apartment told me that including gas, electricity, and water, the cost was about $15 a month. The same space in New York City would cost from $150 to $200 a month, and be less comfortable.

All houses in the Zone, including the furniture, are owned by the United States Government and cannot be rented by those not employed by the Government. Government employes have the privilege of renting their houses for a brief period when absent on vacation. There are two excellent hotels just outside the Zone, the Washington, at Colon, and the Tivoli at Ancon.

Another feature of life in the Zone is interesting—the commissaries. These are under Government control and food and all necessary articles may be bought at a cost generally lower than in the United States; all residents of the Zone are required to buy from the commissaries. No cash is taken, but coupon books, resembling a 1,000-mile railway ticket, are provided and a coupon is detached and offered in payment of any article purchased.

All employes of the Government are given annually a vacation of two months with pay. If any employe does not take an annual vacation, the time accumulates, and the second year he is entitled to a vacation of four months. Some employes spend a brief period in the highlands of Panama or Costa Rica, but the great majority go to the United States. As the Panama Railroad, and also the line of steamers to New York, are owned by the United States Government, employes are given the remarkably low rate of $30 from Colon to New York. This enables the users to have an outing at a reasonable rate.

There are two seasons—the wet and the dry. The wet season begins about May and lasts eight months. The dry season of four months, beginning in January, is a most delightful time—rather warm in the middle of the day, but always a good breeze at night. No day in the Zone is as hot as New York, Philadelphia, or Chicago in August. In the wet season, the houses become damp, and clothes, shoes and other articles of apparel become mildewed unless kept in a dry closet.

The fact is that there are burning lights in the closets throughout the whole of the wet season and often in the dry season. An electric light is kept burning in practically every piano. Between the wet and dry seasons it is disagreeable, for there is little breeze and the humidity is great. Energy is at a low ebb. It is this depressing time, and the fact that it is warm at all times, that makes an annual vacation a necessity. Generally, women suffer more than men.

The drinking water from Lake Gatun, which has passed through the purification plants at Mount Hope or Miraflores, is remarkably good; indeed, every drop is chemically pure. A bountiful supply of ice is also manufactured. Much of the food is brought from the States, but the Chinese gardeners provide large quantities of fresh vegetables.

There are club houses at Cristobal, Gatun, Pedro Miguel, Balboa, and other places. In these houses are reading and billiard rooms, bowling alleys, moving pictures, concerts, telephones, barber shops, lunch counters, and places where soft drinks are sold.

At Balboa there is a large fresh-water swimming pool where instruction is given, and many children 'earn to swim and dive quite young.

Recreation and amusements are also furnished by the Young Men's Christian Association, the Young Women's Christian Association, the Catholic Welfare House, the Camp Fire Girls, and the National Women's Club. There are golf links, tennis courts, baseball fields, and athletic sports are encouraged.

*Excellent School System Is Organized*

The United States had scarcely taken possession of the Zone when it began to organize schools, even in the jungle. At the time of my last trip to the Zone, I was fortunate in meeting D. C. O'Connor, who organized the schools, and with whom I held several conferences. Mr. O'Connor gave me many first-hand facts in regard to the establishment of schools. When the United States assumed control of the Canal Zone in 1904, almost all of the area was jungle, with numerous native villages connected by trails. The houses were built of upright poles plastered with mud; the floors were dirt, and the roofs thatched.

There were no schools. Along the line of the Canal, adjacent to some of the native villages, the French had left frame buildings which had been used to house their employes. These buildings were in bad condition but were used for school purposes. No effort had been made to establish a school system until the American occupation. In 1904, the Isthmian Canal Commission authorized the establishment of a system of free public schools.

The next year a census of children, from the ages of six to sixteen years, was taken and revealed two thousand children of school age. The greater part of these were the children of Jamaican negroes who labored on the Isthmus during the French régime. When the work of organizing schools was begun, many parents hurried their children into the mountains beyond the boundary of the Zone.

After the census had been taken, supplies of desks, slates, and elementary textbooks were ordered from the United States. The next step was to provide schoolhouses, and this was found to be most difficult, as workmen of every type had been brought into the Canal and it was felt that homes must be provided for these people. It was deemed unbusinesslike to assign a building for a school while there was urgent demand for its use as living quarters for workmen.

The first available house for school purposes was at Corozal and a force of carpenters remodeled it. The work was completed and by the beginning of 1905 the schoolroom was equipped and ready for occupancy. On the second of January, 1906, the United States flag was unfurled, pupils took their seats, and the first American public school in this region was opened. It was about this time that municipal schools under the direction of mayors were established at Cristobal, Gatun, Gorgona, Empire, Culebra and LaBoca. The Government schools were supported by funds of the Commission and the municipal schools by municipal taxes. In 1906, the municipal schools were taken over and incorporated into the Government system. In the same year, the Bureau of Municipalities was created and the schools placed under the Chief of the Bureau.

It is suggestive that five months after the opening of the first school at Corozal, there were eighteen schools in operation with six hundred and eleven pupils and twenty teachers. Ten months from the opening of the first school, there were thirty-four teachers, thirty schoolhouses, and one thousand one hundred and thirty-seven pupils enrolled. Four of the buildings were for white children and twenty-six for white and colored. Fourteen of the teachers were American, nineteen colored, and one Panamanian. The schools were organized as an independent division under the Department of Law and Government. This enabled the superintendent to plan courses of study, select and assign teachers, provide transportation for teachers and pupils, select school sites, and recommend plans for proper ventilation, lighting, and sanitation.

In 1907, a curriculum was provided for the grading and classification of pupils according to the system generally prevailing in the United States. Elementary grades were established in all schools, and high school courses were outlined for pupils completing the usual eighth-grade subjects. High school classes were organized at Culebra and Cristobal. The satisfactory completion of this course enabled children to enter colleges or universities in the States. Ernest L. Cook, of Nebraska, was the first high-school principal at Cristobal, and Miss Ida Alstaetter, of Ohio, was the first high-school principal at Culebra. Miss O'Connor, daughter of the first superintendent, was one of the first American teachers.

*How Difficulties Were Met and Overcome*

In establishing the school system there were many difficulties, for, on account of the greatly increasing number of employes and their families coming to the Zone, it was difficult to provide living quarters and there was a waiting list of several hundred on file most of the time. Many of the employes thought that no buildings should be provided for schools until their families had been properly housed. It was difficult to secure carpenters in sufficient numbers and it was necessary to ship building materials from the United States. This was often slow in coming, and in addition, the hundreds of sick and dying people were obstacles in the way of a building program.

It was also difficult to secure teachers. When the school system was organized, there were no American

Tropical territory in the Canal Zone, which United States engineers found full of filth, malaria and yellow fever.

Union Church, Balboa, Canal Zone, dedicated January 24, 1926.

teachers in the Zone and the salaries were too small to attract white men and suitable living quarters could not be provided for women. Suitable persons for teachers were sought to be placed in charge of schools as these were opened.

The civil administration looked upon the Canal Zone as a miniature state, the inhabitants of which were to enjoy the rights and privileges held by them for generations, and the natives and West Indian people were to be reconciled and made friends of the new government. They were treated in a friendly manner and became an aid in the protection of the Zone. Their children also were to be trained and educated along lines that would promote the purpose sought, and schools were established in every village in the Canal Zone where twenty-five or more children could be brought together.

Schools for native children were often located in almost inaccessible places, as, for example, at Toco Point across the way from Cristobal. The lumber was carried from Cristobal in a small launch that was a constant menace to the lives of the operators. It seemed a strange proceeding to the natives, many of whom had never known the meaning of a school. A school was organized at Las Cruces on the Chagres River not far from Gamboa which was the landing place for the transfer of carriers between the Atlantic and Pacific oceans before the building of the Panama Railroad.

This village contained about six hundred natives whose houses were built of poles plastered with mud and thatched with palm branches. Here a school was organized, the first one established in a village several centuries old. The lumber was loaded on cayucas at Gorgona and poled up to Las Cruces five miles distant. The only other means of reaching the town was by narrow trail from Bas Obispo and this trail was almost impossible in wet weather. Much hardship was endured in the transportation of the lumber for the school on account of the sudden rise of the Chagres, and some lumber was lost.

Three miles from Las Cruces a free school was established, and for the first time in its history, the poor children of that aristocratic section were given the opportunity of an education. Bas Obispo was the chosen place for the winter homes of wealthy families. It is believed that the establishment of this school suggested the plan and scope of the excellent system of primary education subsequently adopted by the Republic of Panama. At the present time there are primary schools at Cristobal, Gatun, Pedro Miguel, Balboa, and Ancon, with American teachers. There are also schools for Porto Rican troops at Empire, and for colored employes at various places. There is an excellent high school at Cristobal and another at Balboa.

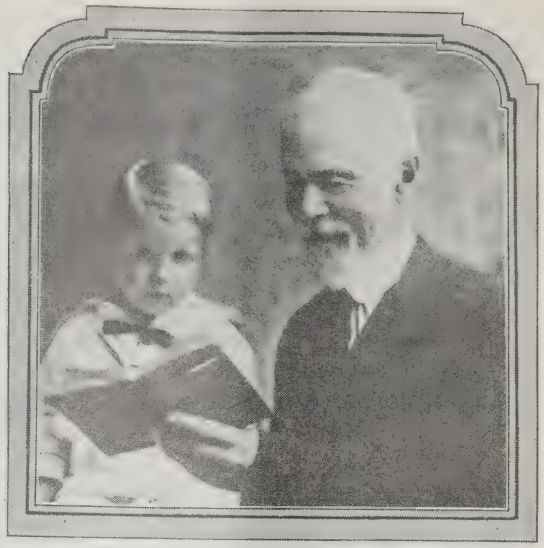
Above—Concrete school building, Pedro Miguel, Canal Zone, June, 1920. Circle—A Canal Zone free public school—San Pablo, 1904. The building was so old and weak that it had to be propped up to prevent its collapse.

It is true that the United States Government does not appropriate money for churches, but it grants sites on which churches have been built. The Cathedral of the Protestant Episcopal Church is at Ancon and work is carried on among Panamanians and West Indians. There is a Roman Catholic Church and Community House at Balboa. The Union Church of the Canal Zone has four branches, under the direction of a Council, at Cristobal, at Gatun, Pedro Miguel and Balboa. The new Union Church edifice at Balboa that cost $129,000 was dedicated on January 24, 1926, with imposing ceremonies. This enterprise constitutes one of the most notable pieces of coöperative work in which the churches of America have engaged. Here it stands, beside the Canal which is a triumph of American engineering skill, a monument to the earnestness and sincerity of American Christians.

The Southern Baptist Church has an excellent edifice at Balboa Heights and conducts work among West Indians.

The American Bible Society has a Bible House at Cristobal, from which Bibles, testaments, and literature are distributed in Central and South America. The Panama Canal and Central American agency of the Bible Society covers the republics of Central America, Panama, the Canal Zone and recently the work has been extended into Colombia. The upper Andes agency of the Bible Society includes the southern part of Colombia with Ecuador, Peru, and Bolivia.

Every American who visits the Canal Zone comes away feeling proud of the achievements of the United States in building the Panama Canal that vast waterway which connects the Atlantic and the Pacific, and shortens the route from Europe and the United States to the Pacific. The visitor is also proud to find that Uncle Sam has made provision for the comfort, the safety, and the intellectual, moral and spiritual development of the people who are serving their country so ably and faithfully at the Crossroads of the World.



The story of how Uncle Sam entered the tropics and built the Panama Canal has often been told, but it might well be repeated, from time to time.

# He Placed Bookshelf in Reach of Millions

## The Man Who Claimed He Founded More Libraries Than Carnegie

By WILLIAM E. BARTON

John B. Alden, first publisher of cheap editions.

JOHN B. ALDEN claimed that he had founded more libraries than Andrew Carnegie. Alden died on his chicken farm at Neshanic, New Jersey, December 4, 1924, and I have seen no mention of his decease in any newspaper. Even if something has been printed and I have not seen it, I should like to tell about the man who never admitted that he made cheap books but was proud of the fact that he made good books cheap, and made more of them than any man since the creation of the world.

I cannot tell in detail the story of his life. He was seventy-eight years of age when he died, and I think was born in Iowa, a descendant of John Alden of the *Mayflower*. In that state I first learn of him, a lad of twelve, lying on the floor before an open log fire, reading the few books which his boyhood home contained. Those he remembered were *The English Reader*, which Lincoln also read, the works of Josephus, and Livingston's *Travels in Africa*.

The home where Alden lived for twenty years, the larger part of his life as a publisher.

At the age of fourteen he left home, and one winter chopped wood at fifty cents a cord. That winter he discovered an old, worn copy of Shakespeare, and it became a mighty inspiration to him. Two winters he spent in country schools, doing chores for his board, and for two months he was in a little academy where he and two acquaintances boarded themselves at a cost of $1.25 a week. From there he graduated into the school of experience.

My next knowledge of him was as a 'train-butcher' selling peaches, apples and literature on a local train between Burlington and Galesburg. Alden, having Galesburg as one end of his route, became acquainted with Professor Hurd, of Knox College, father-in-law of S. S. McClure, and he gave the lad helpful direction concerning his own reading. Abbott's *Life of Napoleon* fired his ambition, and he read Herbert Spencer and John Stuart Mill under this wise preceptor. The lad yearned for a college education, but trouble with his eyes prevented. He went to Chicago and clerked in a bookstore. He attended Major Whittle's Sunday school, and assumed charge of a department whose record attendance was 443. Then he started a little book and stationery business on the West Side and began his first publication, a children's paper, *The Bright Side*. This attained a large circulation almost immediately, but the Chicago fire wiped it out in 1871.

My acquaintance with Alden's work was just after the Chicago fire when I was a lad of ten. He started a little magazine called *What Next?* His premium offers were liberal, and I secured a club of subscribers and read his paper till the *Youth's Companion* bought it out. By this time he was known as a live wire in the publishing business, and was called to New York as publisher of *Hearth and Home* which had a list of eminent contributors, its editors being Mrs. Harriet Beecher Stowe, Ik Marvel and Edward Eggleston.

His work as a magazine publisher gave him knowledge of printing costs, and he discovered almost accidentally that the printing and binding of a book are quite inexpensive matters, the marketing and publishers' overhead absorbing most of the price. He had been working up a 'Book Exchange' by means of which good books no longer desired could be traded for others that were wanted, but he decided that new books could be produced cheaper than old ones could be stolen. So he set to work to make new books and good ones.

In January, 1879, he launched forth as a book publisher, producing non-copyright books, including *Robinson Crusoe*, *The Pilgrim's Progress* and other standard $1.50 works at a price of thirty-five cents, and making money. These books sold immediately and enormously.

Chambers' *English Literature* was published in two large octavo volumes at seven dollars. Alden issued it in four small volumes at two dollars.

## A Dinner and a Tour of the Markets Gives Evidence of Much Prosperity

I was a sawmill worker, a lowly lumber-handler.

By JAMES STEVENS

ILLUSTRATED BY CARL E. OHLSSON

ON A recent Saturday evening I went out with a friend of mine who is a highly skilled saw-filer. He is paid fifteen dollars for every eight hours he works, and time and one-half for Sundays and overtime. Last year, he tells me, he made five thousand dollars. He earns every cent he gets, for he is really a professional man, and a talented one. Saw steel is to him a living thing; let him stick a grinder on it and he becomes like the scientist with his test tubes, or the sculptor with his chisel. To the mere observer there are only edges and points under the grinder; to the skilled filer every tooth and raker of the used saw has a shape and character of its own; and it is his job to file them all to the standard form his eye has set.

But my friend makes no pretense of being a tony professional man. He never got through the eighth grade at school. He feels vastly inferior to any man with a college education, even though the man hasn't enough manual skill to drive a nail straight. But my friend does feel that he belongs to the aristocracy of labor; and when he is with a man like me, who never got any higher in school than the eighth grade, he is pretty high and mighty. The fact that I am now a writer means little to him. When we first became friends I was a sawmill-worker, a lowly lumber-handler; and so I still remain to him.

The saw-filer drove up to my house in a coupé.

'We're steppin' high tonight, old-timer,' he said with a kind smile. 'I'm takin' you over to eat in the Rose Room of the new million-dollar hotel.'

'That's fine,' was all I could say as the car purred down the street.

I was back in my place as a lowly lumber-piler and ready to listen to whatever the saw-filer wanted to talk about. But he didn't have much to say until we reached the great hotel. When we entered the Rose Room he followed the waiter who beckoned to us, and I trailed him. The room was so vast, so gay and so bright that I felt like I did when I dreamed over fairy books as a boy. The tables had a dazzling shine from their linen, silver and dishes. There were roses on all of them. The walls and lights were rose-colored, too; and the ceiling, which seemed high enough for a palace, had paintings of garden scenes. The place was too rich and grand for me. I sat down at our table and just stared. I thought that the people must all be millionaires entertaining their visiting duke and marquis friends from Europe. But my friend was perfectly at home. He was not the least flustered as he ordered our dinner; and the waiter didn't seem to realize that he was a saw-filer at all

After we'd had crab cocktails I felt more comfortable, and I began to think. My first thought was this:

'How much at ease this saw-filer is in such a princely place! He's a far cry from the miner of the old days, who struck it rich, went to the finest hotel in the city for a feast, and could think of nothing to order but a hundred dollars' worth of ham and eggs!'

We sipped our soup in a proper, delicate style; and as he sipped, the saw-filer gazed now at the orchestra, now at a pretty blonde who was making things merry at the next table, now at the pink and white roses on our table. When he was done with his soup, he buttered a bit of bread, nibbled at it, and began to talk as naturally as though we were sitting on the bench in the filing shed where he worked.

Over the porterhouse steaks we both got to going it in our regular chummy fashion, and by the time we got to a dessert of French pastry and sundaes I was as comfortable with my friend as though we were in a ham-and-egg joint. We smoked and talked over the coffee for an hour; then my friend planked down a ten-dollar bill, which just paid for the dinner and cover charge, with a dollar tip for the waiter.

'I had a mighty fine time,' I said, when we parted.

'I did, too,' said the saw-filer.

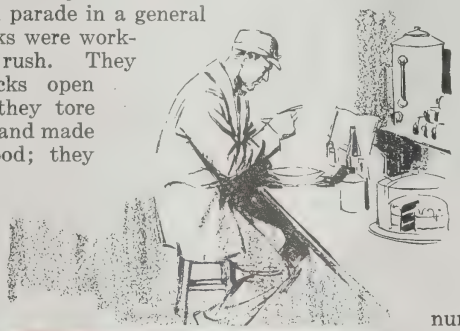
When I went to sleep I was still seeing the Rose Room, and I went on seeing it in my dreams. And then came another vision, a grand procession of all the city eating places that Americans know.

I saw the Marine Rooms, the Spanish Rooms, the Crystal Rooms, the tea rooms Orange and Almond, the grill, the grotto, the chicken dinner roadhouse, the breakfast nook, the coffee house, the rathskeller, the restaurants and cafés, French, Italian, Spanish, Greek, Hungarian, Yiddish,

Chinese, Japanese and Southern, the cabaret, the supper club, the roof garden, the fountain, bakery and market lunches, the cafeteria, the short-order counter, the chop house, the oyster palace, the dairy lunch, the delicatessen, the waffle house, the automat, the hot dog stand, the popcorn wagon, the cigar counter with its chocolate bars, the old-fashioned beanery, the old-fashioned boarding house —I was certainly hungry for hot cakes and eggs when I awoke in the late morning!

But you do not need to dine in all these various eating places to see that America has become a true land of plenty, the realization of the ancient dream of a promised land. You need only to take a walk through the market streets of any American city.

What American scene is more familiar than this one? A vast meat market, its walls and ceilings shining with an enamel as snowy white as the caps, jackets and aprons of the men behind the great glass cases on the counters. In those cases all the sea foods of all the oceans glitter lusciously in patterns of dazzling colors, and raw, red steaks, roasts and chops, streaked thickly with corn-made fat, bring moisture into the mouth of the beholder as he looks them over. Above are hanging battalions of dressed duck, geese, hens, capons and turkeys. They are guarded by fat hams and wide sides of bacon. There is a spicy smell from pails of pickled fish.



A vegetable market. Here are stalls of green corn, green peas, green string beans, and above a rack piled high with jolly turnips which have a winey flush on their bulging cheeks; there is a row of stalls where slender carrots, somber beets, humorous onions and radishes, dewy lettuce, motherly cauliflowers and rotund cabbages modestly display their homely virtues; and beyond them is a regular mountain range of shining fruits, pyramids of beautiful colors, where oranges, apples, plums, pears, peaches and grapes are heaped high. Yellow bunches of bananas swing before them. Coarse sacks gape to reveal the benign and companionable spud. Uncovered boxes show dusky dried prunes in neat rows. Rhubarb and raspberries. Peanuts and pecans. Green peppers and garlic.

What other raw and beautiful foods? Here is a small but showy dairy market. A long glass case incloses bottles of milk and cream, mounds of snowy eggs, huge cubes of golden butter, and fifty-seven varieties of cheese.

For delightful odors enter the bakery. Here you will smell sugar and spice and everything nice. And bread hot from the ovens, which has a smell as appetizing as that of frying bacon or boiling coffee. Breathe the bakery air, with its fragrance of hot spice and hot bread look over the designs of the cookies and pies and the colors of the cake frostings; and then go to an art gallery and strive to find such beauty in any picture there!

On another Saturday I watched the afternoon food parade in a general market. The clerks were working in a great rush. They flipped paper sacks open and filled them; they tore off sheets of paper and made up neat rolls of food; they took flat squares and oblongs of pasteboard and filled them with dozens of eggs and pounds of butter. They dragged stalls, racks, crates and sacks for vegetables. They dug into pyramids of fruit as miners dig into mountains. Loaded shelves along the walls shone with all the colors of the rainbow. Ladders rattled and banged before them, and from the ladders the clerks rolled down jars of honey and pickles, glasses of jelly and mayonnaise, cans of fruit, spinach and soup, cartons of oats, wheat and rice, boxes of spice and coffee and tea. Food was on the move.

There was a crowd coming, a crowd buying and looking, and a crowd going with loaded arms. The people of the crowds were mostly women; many had children with them; and all looked as though they were used to housework and marketing. They bought amazingly. It was hard to imagine where the money came from. No one appeared to be poverty-stricken, but it was obvious that most of them were the wives of workingmen.

There were a number of men in the crowd; laborers, probably, who worked nights and did the Saturday marketing before they went on shift. The brawniest of the men, the ones who were obviously laborers, bought unsparingly. Whenever a display of some food caught his eye he would buy it without bargaining, and then keep on until he had an armload of packages. And most of the women left the market with their shopping bags jammed to the top. Certainly, I thought, American workingmen are not spending *all* of their wages for automobiles, radios and picture shows. They are making the best of living in a land where there is plenty of food for everybody.

As a roving workingman, I had always been used to taking my food where I found it, thinking of the cost of living

The place was too grand for me. I sat down at our table and just stared

only in terms of the weekly rate for board. In my youth I had worked at common labor for two dollars a ten-hour day and paid five dollars a week for board and room. After the war I had worked eight hours a day, making between five and seven and a half dollars a day, on various jobs, and paying from seven to ten and a half dollars a week for board and room. But now there was what the college sociologists call a 'higher standard of living' —meaning more clothes, more food, more fun—and the board and bed I had for around nine dollars after the war were so much better than what I had paid five for in my youth that it would have called for the extra cost even then.

It is my firm belief, taken not from windy theories but from my own experience and observation, that the cost of distributing food lessens every year, due to the improvement and growth of transportation and the distributing organization.

My wages as a common laborer were doubled in fifteen years, my work day cut twenty per cent. The cost of my living rose about forty-four per cent. But now, instead of a straw bunk in a shack or a cell in a sloppy rooming house, I had a clean, airy room with white curtains on the windows, a tall shiny dresser, a thick mattress on stout springs, and running hot water at the wash bowl. And there was as much difference between the old-time boarding-house meal and the new one. For nine dollars a week I lived in actual comfort all the time, and occasionally luxuries were thrown in. Yet a profit, a good one, was made by the landlord from this weekly sum.

As I watched the Saturday afternoon crowd in the general market and noted that the greater part of it was comprised of working people, I thought of the weekly sum I had paid for board as a workingman, and I grew curious to see how much food it would buy in this general market.

Here was a steer steak special. Twenty cents a pound. Forty-five pounds of steak! I'd need a wheelbarrow for that! A veal special at ten cents. Ninety pounds—a whole calf. A good pot roast at thirteen cents. It was too much trouble to figure the number of pounds of pot roast that nine dollars would buy; but it would certainly make a man-sized load. Pork was higher, twenty-five cents and up; but I'm not much of a hand for pork.

I turned to the dairy counter. Nine dollars would buy eighteen pounds of butter, twenty dozen eggs, or forty-five pounds of cottage cheese. I looked through the bakery window. Ninety pound-loaves of bread! Or five hundred and forty doughnuts! Or thirty-six pies! I backed away from the bakery window and nearly fell over a stack of sacked cabbages. Three cents a pound. My nine dollars would buy three hundred pounds of them! Holy mackinaw! I'd have to hire a truck.

What price eating! Nine dollars would buy so much food; and I could go out and swing a shovel or pick up boards and put them on a truck, or pick up bricks and put them in a stack, or do any other such simple job and make the nine dollars—in two days! No wonder the American food parade is the greatest show on earth.

For such it certainly is. Whatever may be justly said against American politics, education, journalism, science and art, whatever inequalities between rich and poor Americans may be shown, the fact remains that as far as getting plenty to eat is concerned any able-bodied person can do it without great worry or effort. Even in the slums there are few starving children today.

# The Dangers of Drugging for Fat

(*Concluded from page 6*)

movers are of this or very similar composition. One and all are utterly worthless in the removal of fat as far as years of experimentation and test in the laboratories of the American Medical Association, and by individual physicians, have been able to determine.

Of late years, several preparations have been marketed under the name of 'creams' for the reduction of obesity in general and the removal of fat on the face and neck in particular. The great majority of these have been subjected to the tests already mentioned and, without exception, have been found as worthless as the pink pills, brown tablets, or bath salts. They have been analyzed in test tubes, and tried out under conditions which their makers declared to be 'ideal,' on the bodies of corpulent men and women, and in no single instance has any reduction in fat been obtained. Yet the manufacture and sale of these high-priced and entirely worthless 'remedies' continues to draw something like $40,000,000 annually from the people of the United States, Canada, England, France and Germany. Many of the 'fat cures' originate in France, but they find their greatest market, and obtain the highest price; in the United States.

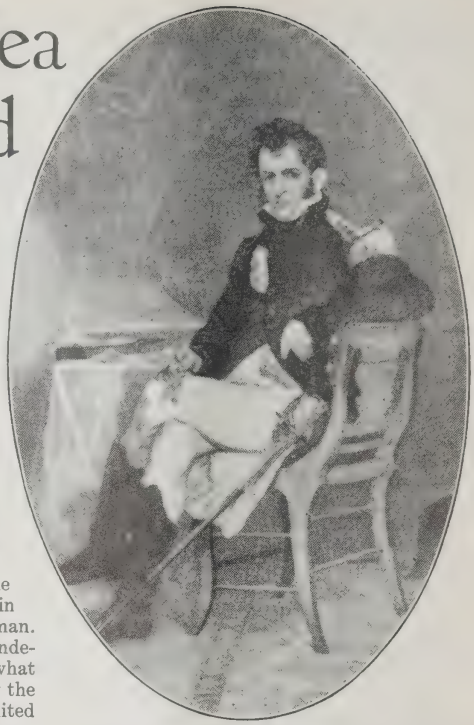
Now, fat may be 'healthy' and it may be 'unhealthy.' As the physician would say, 'fatty accumulations in the tissues of the body are found in health and in pathological conditions.' These are usually described, respectively, as 'fatty infiltrations' and 'fatty degenerations,' though it is admittedly difficult to draw a sharp dividing line between the two. There may be, and very often is, a considerable measure of fatness, even to the point of inconvenience to the individual possessing it, without any disturbance to the health of the corpulent one.

Many of those who undertake a reduction of their fat find, if they succeed, that they are no longer well; that they become subject to every passing illness; that their 'resistance' to disease is lowered; that their physical and mental activity is retarded; and that the removal of the fat has so disturbed the normal balance of their bodies that they must resort to special fat-producing diets to restore themselves to health. In other words, the treatment of obesity, corpulence, or plain 'fat,' as one wishes to call it, is dependent entirely upon the physical characteristics and conditions of the individual body. No one treatment can be or has been devised for the removal of excessive fat.

One of the earliest known remedies for obesity—and, incidentally, one of the most effective—was that of the Egyptians, who probably got it from one of the earlier races. In this, the fat man or woman lay down on his or her back on a hard floor and employed a half hour in vigorously rolling a heavy wooden ball over the abdomen. Some tribes of North American Indians were found to be doing the same thing when white men arrived in the New World. Then, along in the 15th Century or somewhat before, the drinking of vinegar as a fat-reducer came into vogue. This remedy was virtually worthless, though the rolling of the wooden ball was of considerable value, since it provided enforced exercise of the parts in which the fat was stored.

Then for some centuries the anti-fat fakers flourished, though never to the extent, nor with the financial returns, of today. But in 1863 arose one William Banting, originator of the modern treatment for corpulence by dieting, a system which gave rise to the name 'Banting,' as applied to obesity reduction by the avoidance of certain foods. Banting eliminated, to the greatest degree possible, all saccharine, starchy and fat foods from his diet, reduced the amount of liquids consumed, substituted meat, fish and fruit as his daily fare and took also, at least once every twelve hours, an anti-acid drink of some kind.

This treatment, with modifications according to individual cases, is still in successful use. Surplus food absorbed in the human body is stored as fat, and one well-known cause of obesity is the taking in of a supply of food in excess of the needs of the individual. That quantity of food which is not excessive for the day-laborer may be three or four times as much as the sedentary worker needs.



In other words, the way to remove fat is to eat less than usual, eliminate the fat-forming foods, and take such exercise, under the direction of a competent physician, as will enable you to approach more nearly to perfect absorption of food consumed—a condition which, by the way, has not yet been found in any human being.

One cause of obesity—taking food in excess of the needs of the individual.

# Three Musketeers at Sea —the Fate of the Third

## Tragedy of the Frigate *Essex*, and Its Gallant Yankee Crew, Who Roamed the Pacific in 1813

Captain David Porter, of the American naval vessel *Essex*.

By WILLIAM JOHNSTON MADDOX

IT WAS a disappointed skipper who brought the light frigate *Essex*, of 32 guns, limping into the harbor of St. Catherine's that bright morning early in January, 1813. For a week Captain David Porter had battled strong northerly winds off the coast of Brazil in an effort to reach Bahia and join the *Constitution* and the *Hornet* for a concerted raid against British shipping in the Indian Ocean. But they had proved too much for him.

And now he was to have his disappointment made complete by the information that the two ships had put to sea. Bahia had been his last hope, even if he could have made it. He had failed to meet them at either of the two places of rendezvous appointed before they left the States—Porto Praya in the Cape Verde Islands and the Island of Fernando de Noronha off the coast of Brazil.

Now he was thrown upon his own initiative. For a lone American ship it was a ticklish situation in which Porter now found himself. The South Atlantic teemed with British men-of-war, and there was not a port along the whole coast where an American ship could anchor with any ease of mind. Officially they were neutral, but both Spain and Portugal were too much dependent upon England to hold her to a strict observance of their neutrality. And not all English naval officers could resist the temptation to take advantage of this.

Perhaps his situation suggested the bold enterprise that now formed in Porter's mind; maybe it merely gave him an opportunity of carrying out an idea that had been there for some time. At all events, he now determined to carry his ship—and the war single-handed—into the Pacific, to deliver a blow at the enemy's shipping where one was least expected.

It was a daring venture. No American naval vessel had ever doubled Cape Horn, and it was doubtful what reception he would receive at the west coast ports. More than likely he would be obliged to keep to sea, subsisting upon the enemy. He was well supplied with money. On the way from Porto Praya to Fernando de Noronha he had captured a British packet with $55,000 in specie. The season was late for doubling the Horn and the *Essex* was low in provisions and naval stores. But, as Porter himself said, it was either this or 'capture, blockade, and starvation.'

On January 26 he weighed anchor. The only chart of the prospective cruising grounds he could get was small and imperfect. On February 14 he arrived at the Cape, and for two weeks battled against the most severe gales, emerging at last, sorely battered, into the balmy weather of the Pacific. At meridian on March 5 the Andes came into distant view.

Porter continued northward along the coast to Valparaiso, where he put in March 15 disguised as a merchantman. Chile, he learned, had declared its independence of Spain, which was somewhat favorable news to him. Peru, expecting the mother country to declare war on the United States, was sending out privateers to prey on American shipping, which already lay at the mercy of English letters of marque. Porter's arrival, therefore, was opportune for American trade.

On the twentieth he put to sea. Five days out he learned that the American whalers *Barclay* and *Walker* had been captured off Coquimbo. The next morning a cruiser was sighted which showed Spanish colors. Porter ran up an English ensign and was surprised to receive a shot across his bow. He replied with several over the stranger, who having come near enough sent an armed boat on board. The lieutenant in charge apologized for firing on a British vessel, explaining that they had mistaken the *Essex* for the English letter of marque *Nimrod*, which had driven their prize crew off the American whaler *Walker*. His ship, he disclosed, was the Peruvian privateer *Nereyda*, of 15 guns, carrying a full crew, and out in search of American vessels.

Revealing his true identity, Porter fired two shots over the *Nereyda* and ordered her to surrender, which she did. He took on board the master and crew of the *Barclay*. Having thrown her guns and ammunition overboard, he turned the privateer loose.

Porter turned northward. Off the Island of San Gallan he overhauled the *Barclay* and put her master and crew in possession. Together they called at Charles Island where a box nailed to a tree served as a 'post office' for the whalers to leave accounts of their luck and their movements. Here Porter obtained some valuable information.

On the morning of April 29 he overhauled the British whaler *Montezuma*, with 1,400 barrels of oil on board. Early the same afternoon he took possession of two more, the *Georgiana* and the *Policy*. From the three he obtained much-needed supplies of bread, beef, pork, cordage, and water, not to mention a welcome addition to the larder in the form of a great number of Galapagos tortoises.

With some alterations the *Georgiana* was fitted out as a cruiser of 16 guns, and on May 8, under command of Lieutenant John Downes, she hoisted the American colors and fired a salute of 17 guns. This was the beginning of an efficient little navy built up by Porter in a hostile sea at the expense of the enemy, an achievement that is one of the romances of naval history. Porter took advantage of the good weather to refit the *Essex* from the captured supplies, a feat all the more noteworthy in that it was done in mid-ocean.

Sending the *Georgiana* to cruise off Albermarle Island, Porter took a turn about Charles Island, capturing on the twenty-eighth the British whaler *Atlantic*, of 335 tons, carrying 24 men and armed with eight 18-pound carronades. A little

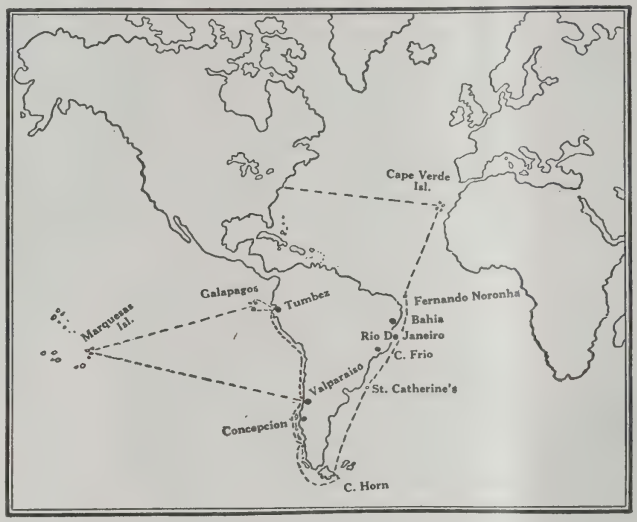
The *Essex* gamely standing off the *Phoebe* and the *Cherub*, in her losing fight outside Valparaiso harbor, March 28, 1814.

later he took the *Greenwich*, 338 tons, 10 guns, and 25 men. Both vessels carried letters of marque.

The *Essex* now stood for Tumbez on the continent, where she dropped anchor June 19. Five days later Downes arrived with three British whalers, which he had taken near James' Island, the *Catherine*, 270 tons, 8 guns, 29 men; the *Rose*, 220 tons, 8 guns, 21 men; and the *Hector*, 270 tons, 11 guns, 25 men.

Porter's successes were beginning to be a problem to him. He was put to it for officers and men to man so many prizes. The great number of prisoners he had accumulated was an embarrassment. A reorganization was necessary, and the opportunity was favorable. Paroling the prisoners he sent them off in the *Rose* on condition that they would not put in until they reached St. Helena. Downes he promoted to master commandant and transferred him with his crew to the *Atlantic*, which was renamed the *Essex Junior* and fitted out as a 20-gun sloop of war. All the stores from the prizes were placed in the *Greenwich*, which became the supply ship of the squadron.

Porter's little navy now consisted of nine sails: the *Essex*, 46 guns; *Essex Junior*, 20; *Georgiana*, 16; *Greenwich*, 10; *Hector*, 11; *Catherine*, 8; *Montezuma*, 2; *Policy* and *Barclay*.



June 30 the squadron weighed anchor and put to sea. The Fourth of July was duly observed. A general salute of seventeen guns was fired—with the enemy's ammunition—and, according to Porter, 'the day was passed in the utmost conviviality.' On July 9 Downes parted with orders to convoy the *Hector*, *Policy*, *Catherine*, *Montezuma*, and *Barclay* to Valparaiso. So short was the squadron of officers that little Midshipman Farragut, just twelve years and four days old, was put in charge of the *Barclay*. Her captain, a violent-tempered old sea dog, didn't like this arrangement.

'I considered that my day of trial had arrived (for I was a little afraid of the old fellow, as every one else was,' wrote Farragut in after life. 'But the time had come for me at least to play the man; so I mustered up courage, and informed the captain that I desired the topsail filled away. He replied that he would shoot any man who dared touch a rope without his orders; he would go his own course, and had no idea of trusting himself with a "d—d nutshell"; and then he went below for his pistols. I called my right-hand man of the crew, and told him my situation; I also informed him that I wanted the main topsail filled. He answered with a clear "Ay, ay, sir!" in a manner which was not to be misunderstood, and my confidence was perfectly restored. From that moment I became master of the vessel, and immediately gave all necessary orders for making sail, notifying the captain not to come on deck with his pistols unless he wished to go overboard; for I would really have had very little trouble in having such an order obeyed.'

Three more whalers were taken here: the *Charlton*, 274 tons, 10 guns; *Seringapatam*, 357 tons, 14 guns; and the *New Zealand*, 259 tons, 8 guns. On September 15 the *Essex* captured a letter of marque, the *Sir Andrew Hammond*, of 12 guns.

Porter's successes had now become noised about, and the *Essex Junior* rejoined the squadron on the thirtieth with news that three British ships, the frigate *Phoebe* and the sloops *Raccoon* and *Cherub*, were out in search of him

By this time, though, Porter had about swept the sea of English ships His mission was finished but his ships badly needed overhauling and refitting for a return to the United States. He decided to winter in the Marquesas Islands, and on October 23 he dropped anchor at Nukahiva, taking possession in the name of the United States and

The cruise of the *Essex*, October 28, 1812—March 28, 1814.

christening it Madison's Island. But having his ships in trim again he was anxious for a try at the three Englishmen.

After watering at San Maria and looking in at Concepcion, the *Essex* and her consort reached Valparaiso, February 3. The morning of the seventh the 36-gun frigate *Phoebe* and the 18-gun sloop *Cherub* rounded into the harbor. Although he was in a 'neutral' harbor Porter wisely cleared for action immediately. With her crew at quarters, the *Phoebe* luffed up. Her captain shouted:

'Captain Hillyer's compliments to Captain Porter, and hopes he is well.'

'Very well, I thank you,' replied Porter, 'but I hope you will not come too near, for fear some accident might take place which would be disagreeable to you.' And ordered the kedges up at the yardarms ready to grapple the enemy. Hillyer hastened to assure him that if he did fall aboard it would be purely accidental.

'Well,' shouted back Porter, 'you have no business where you are. If you touch a rope yarn of this ship I shall board instantly.'

The Englishmen then hauled out to sea, and for six weeks kept watch at the mouth of the harbor.

Before long rumors began coming to Porter that British ships were on their way to reinforce the blockade. He decided to seize the first opportunity for making a break. The *Essex* was to go out first. In thus drawing off the two cruisers he hoped to enable the *Essex Junior* to get away unmolested. Neither British ship would attack the *Essex* alone.

The very next day after coming to this decision, March 28, a heavy wind blowing seaward caused the *Essex* to part her port cable. About noon her starboard anchor began to drag. It was a desperate situation. Cutting his cable, Porter boldly made sail hoping to pass out to windward of the English ships, which were sheltering behind the headlands on the eastern side of the harbor's mouth. For a time things looked promising. With his topgallant sails reefed he passed out beating to westward. Just beyond the headlands, however, a violent gust carried away his main-topmast. It was return or fight now. The first he soon found to be impossible. So standing across the entrance of the harbor he let go an anchor within pistol-shot of the shore.

Both the English ships were bearing down upon the crippled fugitive. Hillyer had assured Porter that he would respect neutral waters. There was no mistaking his purpose now, however, in spite of the *Essex's* being well within three miles of shore, or, as they reckoned it, a cannon's shot.

Porter cleared for action. His gunners had hardly gone to quarters, when at 4 o'clock the *Phoebe* took up a position under the *Essex's* stern and opened the engagement with her long 18's. The *Cherub* tried to take up a like position on her bow, but a few well-directed shot drove her off and she joined her consort. Both now poured in a destructive fire to which the *Essex* was unable to reply for a time. Three long guns finally brought to bear through the cabin windows forced the English after half an hour to withdraw for repairs.

Returning to the fight they took up a position on the *Essex's* starboard quarter just out of range of her carronades. When she was being equipped for the cruise Porter had protested against these short-range guns. With their long ones the British now delivered a galling fire. It was up to Porter to close in if he could. The only sail that could be got to pay her head off with was the flying jib. Like a wounded thing the *Essex* gathered way and soon was able to bring her carronades into action. The Americans fought gallantly. For a few minutes the fire on both sides was tremendous. It proved too hot for the *Cherub*. She hauled off for the second time, and for the rest of the engagement contented herself with keeping up a distant fire with her long guns. The *Phoebe* held on tenaciously, but the fire became too hot for her also and she edged away grudgingly, throwing in a shot from her long 18's deliberately and with good effect.

It was now nearly 6 o'clock. The *Essex's* decks were strewn with dead and the cockpit choked with wounded. At one gun three separate crews had been swept away; only the captain, and he slightly wounded, survived. Porter saw that he was too much crippled to close in on the enemy. The last recourse of a defeated commander remained —to run his ship ashore and destroy her. But within a musketshot of the shore the wind shifted and swung him toward the enemy.

At this moment Downes came alongside. He had pulled through the fire for orders. Porter sent him back with instructions to prepare to defend or to destroy the *Essex Junior*. He took several of the wounded and left three of his own men. As he pulled away a cheer went up from the men on the *Essex*. Porter now tried to bring his ship around by dropping a sheet anchor so he could work his broadside, but the hawser

parted. Suddenly flames burst from his forward and main hatchways, followed by an explosion below.

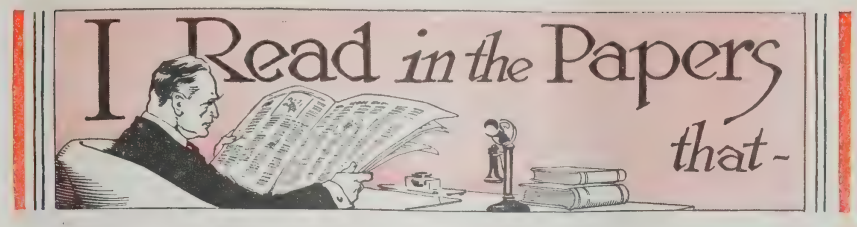
It was now imperative for him to strike his colors in the interest of the survivors. First, though, he gave permission for those who wished to do so to leave the ship and swim ashore. Much the greater part of the crew, however, stuck by him and courageously set about putting out the fire. Before actually hauling down his colors, he called for his officers. Only one, Acting Lieutenant McKnight, was able to respond. In all, only 75 men, including officers, out of 255, remained fit for duty. And in the meantime the enemy stood off pegging away deliberately as though at a target, sending shell after shell crashing into her hull.

At a word from Porter the colors were brought down, ending one of the most remarkable actions in naval history. It had lasted two and a half hours. The English had taken their share of the punishment, too, for the smoothness of the water made the fire on both sides exceptionally destructive. The *Phoebe* had no less than eighteen 12-pound shot below her water line. More than seven hundred 18-pound shot had been gained at the *Essex*, who had discharged her long guns no less than seventy-five times each in broadside.

By an agreement between Captain Hillyer and Captain Porter, the *Essex Junior* was made a cartel and sent to the United States with the survivors. It was July 5, 1814, when they reached Sandy Hook. The home-coming of the handful left of the 319 who had put to sea back in October, 1812, was like the return from a great victory. New York received them riotously, and both there and later in Philadelphia people took the horses from Porter's carriage and drew it along the streets themselves.

A few years later Porter resigned from the Navy, having been censured by a weak-kneed administration for enforcing respect for the flag in a Caribbean port, and became commander-in-chief of the Mexican navy. A later administration recalled him and gave him a diplomatic post abroad.

## Old Fernandina



NAMED for Ferdinand of Aragon, once king of Spain, and a leading pirate rendezvous during its early days, the city of Fernandina, Florida, is the only town of importance on what is now known as Amelia Island, twenty-two miles long and from one-half to one and one-half miles wide.

In the three centuries since the days of the pirate Lafitte and his comrades, mysterious diggings have sprouted at various parts of Amelia Island.

During the War of 1812 the port of Fernandina became one of great importance. At that time it was the center of contraband cotton export and smuggling to England.

A little later Captain Jose Lopez, who held the Spanish fort on Amelia Island, surrendered to the forces of General McIntosh, leader of the Florida filibusters and Venezuelan patriots. Five years later, the port was captured by Sir Gregor MacGregor, who had allied his interests with the insurrectionists of South America. MacGregor established himself as King of Fernandina and for many months a régime of feasting, carousing and ribaldry dominated the port.

His army finally became so boisterous that the United States interfered and quietly took command of the town.

a new twist has been given the story of the destruction of an entire issue of the *American Mercury*. The most recent version appears in *Patches:*

'Last week in the plant of the Haddon Press, in Camden, where the *Mercury* is printed, 60,000 copies, or perhaps it was 59,999, were destroyed. They were of the issue about to be run off. H. L. Mencken, editor of the paper, said later he had ordered the destruction of the copies, but he wouldn't say why. He explained he had wanted to eliminate the story, "Sex and the Coed," which was to have appeared in the issue.

'Here's what a Camden man who ought to know says really happened.

'Mr. Mencken was ordered by Alfred Knopf, publisher of the *Mercury*, to throw out the story. He refused. Knopf ordered the copies burned in the plant of the Haddon Press, of which he owns an interest. Mencken arrived after a rush from Baltimore in time to see the crumbling, smoldering bits of charcoal that had been the week's issue of the magazine.'

Clinton W. Gilbert, well-known caustic newspaper correspondent, recently enlightened his readers as to the way 'they come back to Washington.' Mr. Gilbert chose as his example Representative John N. Tillman, of Arkansas. Up for re-election, Mr. Tillman extended his remarks in the *Congressional Record* in part as follows:

'I sing the Ozarks. There my home is. I want to paint a picture of this favored land. . . . Ours is a land of peaches and cream, of violet skies and golden Indian summers, a land rich in blossoms and fruit, with a climate ideal . . . It is a land of enchantment and variety; here a stately country home, there a plantation with its broad fat acres laughing under a harvest of fruit, of vegetables, of meadow and grain. The mocking bird sings till midnight among the pink peach blossoms and white pear blossoms. Here is a fragrant pine; there a virile white oak; there a branching elm; there a stately mountain range; there a rippling stream of liquid silver; there by the roadside a bubbling spring ever holding up its pouting lips to be kissed by the thirsty traveler. (Applause.)'

And, besides, Arkansas has something worth boasting. It is no extravagance to say that when Arkansas is discovered, Representative Tillman's remarks will be restrained tameness compared with the chorus of praise that will be let loose.

ɛ ɛ ɛ

the *Detroit News* requested the Reverend Dr. Edgar Dewitt Jones to attend a performance of a current revue, which boasted in its advertising of its high sophistication, and give his impressions of it. Among other things Dr. Jones declared: 'The very clever comedian who "substituted for the village parson" showed a good deal of finesse and was rather funny. Ministers are very human and they make mistakes like other people. Most of the ministers that I know are hard-working fellows, courageous for the most part, and much more tolerant of the frailties of mankind than are their critics. *Still I wonder how long Mr. Shubert and other theatrical managers would last if instead of burlesquing a service in a Protestant chapel, they substituted a Catholic church or a Jewish synagogue. It is truly remarkable how cleverly the stage steers clear of a Catholic priest or a Jewish rabbi and unloads its burlesque on a Protestant preacher ten times out of ten.*'

recent prosecution of the operators of so-called 'diploma mills' has by no means ended the activities of these institutions. The American Medical Association has just disclosed that two 'universities' hold forth in a single fourteen-foot-square room in a Chicago office building. Both of the 'schools'—the Lincoln-Jefferson University and the University of Trinity College—are headed by one man, the 'Reverend' A. Worger-Clade. In a period of a little more than two years the Lincoln-Jefferson University issued 536 degrees, in twenty different subjects. Three medical diplomas are said to have been issued.

Oliver McKee, Jr., says in *The Boston Transcript:*

'Many a war, it is safe to say, has broken out in Europe and elsewhere over issues no greater than those which, from time to time, cause sectional alignments on Capitol Hill. We are a people made up of many sections, and if the interests of North and South do not clash as they did in the decades that preceded the Civil War, there is still an abundance of opportunity for sectionalism to show itself. And by the same token, it is a great tribute to the genius of American political institutions that sectionalism in Congress no longer menaces our national unity.'

ɛ ɛ ɛ

there is a 'war' now in progress in England with the Thames as a crowded battlefield—a war between tug and sailing barge owners. Tug would prevent barge from proceeding under sail up the Thames beyond Greenwich. Barge resists efforts of tug to force attentions upon it. Bargemen and tugmen fight—in the vehement way they have . . . It would be a pity to limit the range of these picturesque London river craft which find a place in the hearts of all who love the science of sailing. Apart from their beauty, they are manned by the very few real sailormen left in the country.

# The Mortgage Blanket on the U. S.

(Continued from page 3)

were sold in this country, and in 1921 the aggregate was even smaller.

Only a small proportion of the 'close to one billion dollars' worth of mortgages floated last year are held by persons in any way resembling the mortgage holder of traditional type. The holders are more like the poor widows and men in distress whom tradition puts on the other side; for the greater proportion of these mortgages were taken by multitudes of small investors scattered over the country—in truth, over the world. One concern claims to have sold them in 33 foreign countries as well as in every state in the Union. The operations of probably a dozen others are equally extensive, and there are scores of lesser ones.

They, together with big operators who deal in the industrial type of mortgage, have created a new setting for the bond for debt on property. Its traditional setting gives to mortgages the attribute of acute necessity; that is, it used to be taken for granted that mortgages were assumed as last resorts only and with fixed intent to extinguish them as quickly as possible. They were accepted only on iron-clad terms that precluded all anticipative risks of loss.

Now mortgages are being treated more or less generally as fixtures, like the machinery in a manufacturing plant or the furnace in the cellar of a home. No longer does the average mortgagor think of how little of that form of indebtedness he can get along with. Rather he assumes as much as he can, and with little thought of extinguishment.

The result is a tendency toward mortgaging to the limit everything that is pledgeable for the purpose. And this last is no longer only what is tangible and enduring but frequently partakes of gambling on future expectation.

'All kinds of private businesses are being bought up . . . and new corporations are being substituted for the old, in order that the purchase price (and more) may be recovered by sale of shares to the general public,' says Professor W. Z. Ripley, of Harvard University, who recently brought the new tendency prominently to public attention. 'They (the shares) are really bonds. And, instead, as formerly, of being limited to two-thirds of the tangible assets, no limit is now set, except the powers of absorption of the investment public.'

Like practice undoubtedly is being employed in the field of pure real estate. The practice in all fields is made possible by exquisite machinery perfected largely in recent years for massing a growing proportion of the savings of the country for investment in mortgages.

These developments have run along with the rise in the general well-being of the nation; they are among the consequences of prosperity. What their further consequences may be is yet to be demonstrated, as, all the practices marking the change are virtually new ones and the past throws but little light upon them.

One thing these new practices presage is a national mortgage indebtedness beyond what anyone would have dared forecast ten years ago.

Unencumbered property of the tangible kind already has become the exception. *A mortgage blanket now covers virtually the entire country. In terms of money value it probably amounts to around one-half of all the national wealth.*

The blanket continues to grow in size, thickness and spread. The growth is promoted by what is substantially a new, but already a vast industry—one having to do with originating, placing and selling new types of mortgages on a national scale.

The old types have not been displaced. They are more in evidence than ever before. Local mortgage brokers are more numerous than they were ten years ago, as the advertising pages of newspapers and magazines testify. Individuals who lend on mortgages directly also are more numerous. Insurance companies and savings banks are putting increasing volumes of trust funds into mortgage loans. The insurance companies now have about $4,500,000,000 so invested. On January 1, 1926, the savings banks of New York State were carrying mortgage loans in the amount of $2,339,400,578, the total having increased 112 per cent since the war.

Hence the funds that have been coming from sources developed by the new mortgage industry are outright additions to mounting supplies of funds yielded by the old sources for this purpose.

It is probable that in 1925 several times the volume of funds that was so invested in 1915 went into mortgages of the various kinds now set up. It is also probable that the total mortgage indebtedness of the country has trebled or more during the last ten years—the most prosperous period of that length in the history of the country.

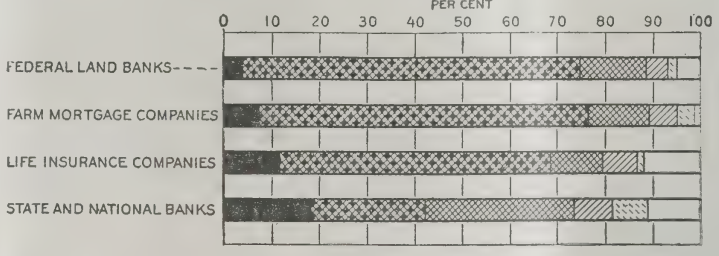
The last inclusive figures on the subject were collected by the United States Census Bureau in 1920. These relate to mortgages on homes and farms only. The first statistics of that kind were collected in 1890. Comparisons show that during the intervening period of thirty years there was steady increase in mortgages.

This increase, undoubtedly at a much less rate than that of the last six years, was general. It was evident even throughout the South, where Anglo-Saxon antipathy toward mortgages holds on as it does nowhere else in this country; it is evident as well in localities, like that of which New York City is the center, where that antipathy has ceased altogether to function.

In the South as a whole 26.8 per cent of owned homes were mortgaged in 1920, compared with 44 per cent in the North and 36 per cent in the West. Yet in the South the percentage more than trebled during the preceding thirty years. In New York City 78.7 per cent of owned homes were encumbered when the last census was taken. Of the 24,351,676 homes in the country in 1920, only 6,522,119 unencumbered ones were occupied by owners. That is to say, nearly three-fourths of the homes were owned outright or in part on mortgages held by others than their occupants. The figures do not include multi-family living abodes, such as apartment houses and hotels.

Increasing mortgages on homes represent no doubt in some measure advancing ownership. But the statistics indicate that *the urge to borrow has outrun the inclination to buy*

Between 1890 and 1920 the proportion of homes not on farms that were owned by occupants increased four per cent, while the proportion of owned homes that were encumbered increased twelve per cent.



Following are the figures for the last four census years:

| *Year* | *Per cent of homes owned* | *Per cent of owned homes mortgaged* |
|---|---|---|
| 1920 | 40.9 | 39.7 |
| 1910 | 38.4 | 33.1 |
| 1900 | 36.8 | 31.7 |
| 1890 | 36.9 | 27.7 |

The percentage of rural homes—about 50 per cent—owned by occupants was larger and underwent little change for the country as a whole during the period of thirty years. The proportion of owned rural homes that were mortgaged, though growing, was smaller than of urban homes. It was 37.2 per cent in 1920.

## WHY FARMS ARE MORTGAGED

Purpose of farm mortgage loans made by leading credit institutions, 1923

Most farm mortgage loans of Federal and joint-stock land banks, as well as of life insurance and farm mortgage companies, were made in 1923 to replace other mortgages and fund other debt. Commercial banks, on the other hand, advanced more of their funds for the purchase of land, for funding other debts, and for general farm purposes.—*From the Yearbook for 1924 of the United States Department of Agriculture.*

'The total farm mortgage indebtedness of the United States has greatly increased since 1920,' states a report of the United States Department of Agriculture that was made in 1924.

It is doubted, however, if there has been much increase in farm mortgage indebtedness during the last two years. A decrease may have occurred, as the result of deflating forces which have not greatly affected city property. And aside from what the Federal Government has done through the land bank system, there has been virtually no amplification of facilities for augmenting the farm mortgage burden. Through the farm loan banks mortgages amounting to about $1,500,000,000 have been placed.

Studies show that fewer than five per cent of farm loan bank mortgages are incurred for the purpose of purchasing land. The bulk merely supplant other mortgages. Much larger proportions of loans made by other mortgaging agencies, such as the insurance companies, banks and farm loan companies, are for expediting purchases. But for no group is the proportion as high as 20 per cent.

For the country as a whole the average interest rate on mortgages in 1920 was 6.1 per cent, against 6.2 in 1890. The last figure presumably included the cost of procurement. There is little doubt that the mortgage interest rate for all the country has gone up considerably.

This rate varies remarkably. The insurance companies realize only around 5.5 per cent on mortgage loans, but the study of farm loans outstanding in 1923 showed that the rate charged varied from 5.09 to 8.48 per cent. The average rate then charged by banks for loans on farm property was 6.89 per cent, but varied from 5.3 in New Hampshire to 9.6 in New Mexico. The rates charged by other agencies, excepting the farm loan banks which make a uniform charge of 5.5, averaged higher.

The highest rates for any section are in the South. In 1920, for instance, 76.6 per cent of mortgage loans on homes in the West South Central states of Arkansas, Louisiana, Oklahoma and Texas were at interest rates of eight per cent or more. In New England less than one per cent bore such high interest.

Census figures for 1920 give only a partial view of the total mortgage indebtedness of the country. The total value of mortgages on owned homes not on farms was estimated at $6,000,000, or 42.6 per cent of aggregate value of places mortgaged. The ratio of mortgaged debt to value increased during the preceding thirty years, but in the case of farms it decreased.

It is deducible from the figures that the total mortgage indebtedness on all living abodes not on farms was fifteen billions of dollars or more in 1920. The total of that on all farms was around eight billions of dollars. Thus the total mortgage indebtedness on all homes in 1920 was around twenty-five billions of dollars. At present it probably amounts to forty billions or more. Other mortgages should run the total up to one hundred billions or more. Then come public debts, in essence mortgages, which amount to thirty or forty additional billions.

Yet leaders in the mortgage industry say the limit, if there be any, is not yet in sight. This is because of the vast number of new buyers of mortgages discovered and developed by intensive selling processes.

These operations revolve chiefly around bonds, by which single mortgages are cut into many parts for wide distribution, or groups of them are pooled and collateral securities issued against them.

# Chalk Artist of Palazzo Gallery

## Romance of a Lost Loved One

This is Antonio, caught while he was making pictures in chalk on the sidewalk in front of the most famous art gallery in the world.

By ROBERT S. ALLEN

IT'S a lusty ballad, that song, 'The Face on the Barroom Floor.' In spite of its tragedy, it's a swinging refrain. Its author, who died recently, once said that the incidents related in the poem were from life. In Florence, this famous city of castles and palaces, of history and art, of science and literature, where a Leonardo de Medici ruled and a Savanarola was burned at the stake for heresy; where are housed Michelangelo's *David* and his immortal burial monuments of the Medicis, where Cellini strutted and posed, loved and fought, this city of a thousand traditions, the mecca of art lovers, in this city today there is another who could be the subject of such a poem.

Broken by war and faithlessness, his mind a deep pool of brooding confusion, inert except for ever-moving hands that draw and sketch as if mechanically propelled, a man about thirty, once a youth full of glorious life and promise, draws in colored chalk on the pavement before him under the river portal of the gallery Palazzo Uffizi, the most famous art gallery in the world, the masterpieces that hang in all their glory in the building above.

For many months he has sat there now, day in and day out, before this building where once as a youth he had come to paint and learn. Unseeing, unhearing, he sits and draws, in an odd, faded suit of clothes, old army cobbled shoes and a broad black mourning band on his left sleeve. Passers-by, tourists, the curious look him over, this Antonio Abruzzino, a son of sunny Naples. His fame and his story have spread. He has become a sight, almost as much as some of the glories of Florence. He pays no attention to anyone. Many drop coins on his work. He gives no heed.

Only recently an American, moved by some erring spirit, dropped on his work a dollar bill. The fingers of the man drew back, startled and trembling. The figure grew tense and the crowd that always surrounds him drew back in fear. With a snarl and yet without moving from his sitting posture he snatched the bill and hurled it from him. For a few minutes he shook as if with ague and then collapsed and began to cry. That day he disappeared and was gone for a week. The bundle of colored chalks were tenderly taken care of by the old flower woman at the bridge head. Each morning she would put the package where he had left it. When he reappeared he was, as before, silent, slouched, brooding. He carefully wiped off the pavement block before him and began a drawing anew.

The stories about this man are multifold. It was the old flower woman who gave an inkling to the tragedy. She told it with a prologue about her 'Bambino' Guillo. Guillo had been a comrade of Antonio in the war. Guillo had fallen. He and Antonio had been great friends. Antonio was an artist but it made no difference to him if Guillo was a mule driver. They had been great friends. Once in a night raid they had a terrible fight. It was dark, one could not see. One just struck and stabbed and clubbed. Antonio had been knocked to his knees. That instant a flare made the darkness white, ghostly day. An Austrian stood poised with bayonet, blinded by the sudden light. It was flashing Guillo who, recovering, struck down the enemy. After that they were inseparable friends. In the great drive of 1918 when Italy smashed the Austrian front, both were struck down. Guillo never rose. Antonio lay a long, long time in many hospitals and then disappeared. It was said he had gone to seek a loved one in America. He either did not find her or found unhappiness.

Last November he returned to Florence, the city of his youthful studies. He sat himself down before the building where he had first begun his art education, and broken, silent, inert, with only fingers moving, he drew on the pavement before him the pictures he had copied in his student days. He would speak to no one. The old flower woman had tried to talk to him, had mentioned a furlough visit he had made once to Florence during the war with his comrade Guillo when he called upon her. He said nothing, his eyes looked away.

# He Placed Bookshelf in Reach of Millions

(Continued from page 15)

Geikie's *Life of Christ* was published at eight dollars; he made it at fifty cents, and compelled the publisher of the expensive edition to cut the price to $1.50.

Then Alden undertook to produce an encyclopedia. *Chambers'* was an English work in fifteen volumes. It sold for $45. Alden produced it for six dollars. Then he engaged American writers to add American articles, and reprinted the whole work. Up to this time he had been using small type. But the new edition of his Americanized *Chambers'* (now the *International*) was in good type, and was the first encyclopedia I ever owned. He called it the *Library of Universal Knowledge*. It was a proud day for me when I secured it. It cost me $10 for fifteen good-sized volumes.

Along came the revised version of the New Testament. Alden secured the largest printing house in New York to give him exclusive use of its plant for twenty-four hours, and at the end of that time the revised New Testament was selling on the streets for a dime.

Photo-engraving by the gelatine process was just coming into use. A great work was about to appear in London, *Young's Concordance*. It was advertised to be imported and sold at a high price. No large work had ever been produced from photo-engraved plates, but Alden found it could be done. He bought one of the first copies of *Young*, and announced an edition at a shockingly low price. The English publishers quickly issued a formal statement. This new American edition, they affirmed, was full of errors. They had not seen it, of course, but they knew that such a work, filled with close references and with Greek and Hebrew words could not possibly be set up in a few days without innumerable errors. Alden published their letter, and declared truly that there were no errors in his reprint that were not in the original.

There was nothing to do but to cut the price of the original edition to meet Alden's competition. Both editions sold well, going into scores of thousands of libraries that would not have purchased the imported edition at the original price. The thousand pages of *Young* were reproduced letter for letter, every Greek accent and Hebrew vowel point in place. The plates cost Alden nine dollars each, but they were accurate and were quickly done.

By this time English publishers were denouncing the 'piracy' of Alden, and he was reprinting all that they said against him and enjoying it. He rather liked to be called a pirate, and he flew the Jolly Roger with right good glee. The American publishers, also, who had enjoyed the English reprints as a profitable side line, were disturbed and not very happy.

Alden was reprinting Tennyson, down to his then recent *Enoch Arden*, which Alden sold for six cents, and was reprinting Green's *History of the English People*, Grote's *History of Greece*, and other famous works. The *Scientific American* in 1881 contained an article about his use of a strange new device by which a solid line of type was cast at a pull of the lever; the article was headed 'Type-setting by Steam.' It reduced the price of composition, and Alden was as I understand the first American publisher to use it successfully and extensively. No wonder there was a protest.

In 1886 Thomas Hughes was in this country, looking after his colony in Rugby, Tennessee. I was riding a circuit in the Tennessee mountains, and visited him in Rugby and he visited me in Robbins. His colony had a library, the gift of American publishers. He accepted it with grim amusement:

'The American publishers who have been robbing me all my life have given me these books.'

I believe it was not by way of repayment of anything they thought due him on account of royalties that the publishers made this generous gift, for that was before the days of international copyright, but because he was the man who, after the Chicago fire, started a movement to provide books for that stricken American city.

This gift was much appreciated and did much to establish Alden's reputation.

I told Mr. Hughes that I did not think the American publishers had hurt him greatly; they had sold to a market which the English publishers could not have reached; that American-reprinted books were not permitted to cross the Canadian border and if anyone attempted to carry one into England the customs house officers at Liverpool tossed it into the ocean.

'Of course,' he said. 'Shall we let them smite us on both cheeks and then kick us behind?'

I rejoined: 'I think you may well consider that you are a far better known and better loved man in America by reason of the reprinting of your books there, and especially since the appearance of both your *Tom Browns*, in fifty-cent editions.'

He did not believe it; if people wanted a good book, they could afford to pay for it.

This conversation we had in Rugby. A few nights afterward he rode over and dined with me. I had something to show him.

'For how much does your *Manliness of Christ* sell in England?'

'Four shillings, and I get a royalty.'

'And how much in this country?'

'A dollar and a quarter, I believe, and I think they have been paying me a little royalty on that, but not much.'

I laid in his hand Alden's reprint of *The Manliness of Christ* for three cents.

'What's that?' he exclaimed. 'Surely it's not all here! They never can do it at that price! And a very neat little volume, too. I'm amazed!'

I replied: 'Some scores, perhaps hundreds of thousands, of intelligent Americans have read this who never would have known of the expensive edition. Is it nothing to you to have influenced the thinking of this great body of people?'

He examined the little volume with great interest. I will not say that I converted him: I will only say that he was pleased that the little book could have so wide a reading.

Alden was embarrassed by his success.

Back door and garden entrance to the home of John B. Alden, Neshanic, New Jersey. Above—Mr. Alden at his business of collecting eggs on his poultry farm.

He had to secure more and more capital, and he had keener competition as other publishers met his prices. I do not know the details. His paper fell into unfriendly hands and there was a crash. When he crept out from under the wreck, it was to renew the attack on the high price of books. Especially did he wish to see a cyclopedia within the reach of every reading home. His business, reorganized under different names, continued putting out moderately priced classics from Nassau Street, then Vesey Street, then Pearl Street, in New York City. Before 1889 he had started the *Manifold Cyclopedia* in forty handy volumes to reach eventually the low price of fifteen dollars.

It is not possible to tell all the ups and downs that were suffered in the book world after the development of international copyright, nor the long struggle to keep the cyclopedia alive as returns decreased and age came on. Thirty-five years after the first disaster Alden gave up the fight for low-priced books—it had long since been taken up by numerous publishers known today—and moved his home from Orange, New Jersey, to set up a poultry farm in Neshanic. There with the youngest of his six children he entered a patient pursuit to remedy the high cost of eggs.

***A Welcome Windfall for Alden***

After a few years he had a letter from a lawyer, saying that he thought Alden had an equity in the settlement of a long dead bank account. Alden was not interested and would not go to New York to find out. The lawyer came to see him. A few papers were necessary. Alden thought he remembered who had bought his old safe. It was discovered, still unsold, in a second-hand store, and he found the papers necessary to establish his legal claim to what was left of the American Book Exchange. It was $4,000, and it came at a good time to cheer his old age.

He devoted himself to something more than raising chickens. He was leading a fight to have the Post Office Department lend back to farmers at low interest the Postal Savings money. He would rise before his chickens were up, and write his articles—'Unshackle the Postal Savings Bank.' I saw one of these, about ten years ago, and renewed acquaintance with a man I supposed to have been dead. There he was on his chicken farm, nearly seventy years of age, not an unsound tooth in his head and having never paid a dentist a dollar, raising chickens and trying to elevate his farmer neighbors, most of whom were indifferent to his plans. But he was happy and in robust health, and as full of fight as when he was the prince of literary pirates.

*THE small investor now supplies an immense market for the 'real estate bond' type of mortgage.*

*One concern thus procured and 'placed' $150,000,000 last year.*

*They call themselves 'Investment Bankers.'*

*Only a comparatively few are subject to the banking laws. Some losses must inevitably occur.*

*These are a few of the important facts which Aaron Hardy Ulm has packed into the second and concluding article on the New 'Real Estate Bond' Industry.*

# A Dance A Week

## STYLE IN DANCING

IT IS the style that makes the dance. But the dance can get its style only from the dancer. Many dancers, especially learners, are impatient of style because they consider it an unnecessary ornament or affectation. This is a fundamental error, as will be readily perceived when finished dancing is compared with the careless or vulgar variety.

In the most finished dancing there will still be individuality of style. No two people do anything exactly alike. The length of step or the speed of movement may differ. So that a dancer must be able to fit his style to that of his partner, a thing easy to do with practice in dancing with many different persons. Dancers should favor one another as much as possible, but the gentleman will do the guiding.

A dance step should be no longer than the natural step when the limb is easily extended without reaching or stretching. To reach for a step is to take one longer than is natural, with the result that the body may be thrown off balance. An easy balance is one of the essentials of finished dancing.

Position of feet in rising. (Note that the foot is drawn well back to insure rising in an erect position.)

Asking a lady to dance. (Gentleman stands with feet together and with slight bend of the body.)

Change hands gracefully. (For the draw step in the Veleta Waltz.)

Balance is obtained by perfectly natural means. Some dancers appear rigid because they do not permit the body to accommodate itself to the changing movements. In moving forward in a dance the body is naturally erect. In a rotary or backward movement there is a slight bend of the body forward. The reason for this is simple. In moving forward, balance requires an erect posture, while in moving backward, which is a drawing movement, the body bends forward. People do this naturally, but a dancer should have these matters in mind and examine his posture to see if he is acting naturally. Style is not artificial; it is doing things in a finished, natural way.

In a closed position, dancers should look over each other's right shoulder. If they do not, the angle of the body is out of line and balance is affected, making easy movements difficult.

Never imitate another unless you have satisfied yourself that he or she is a better dancer than you are. And the easy grace of balance is one of the best tests.

Every movement of every dance is timed to music. Some dancers hurry as if the music would not give them time to execute the movement. If feet and body, without haste and without lagging, move easily and naturally to the rhythm of the music, there need be no difficulty about 'time.'

SUGGESTION AS TO MUSIC. As a rule, dancers, especially beginners, pay too little attention to the music. They think about the movements of their feet instead of the rhythm which the feet will naturally obey if not interfered with by the dancer's anxious thought about making the right step. Giving way to the music, floating away on its rhythm, is the very essence of dancing. On the contrary, thinking of your feet is the easiest way to bungle your dance. Many good dancers are usually ahead of the music, but it is difficult to convince them of the fact because they do not listen.

---

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Dearborn Publishing Company, Dearborn, Michigan.

# The Lost Mine of Silver Islet

## When the Sea Conquered in Its Battle With Man

By RICHARD A. HASTE

IN THE vicinity of Lake Superior is the 'height of land'—the great ridgepole of the roof of the continent. This region has always been a land of mystery. Here are laid the scenes of many beautiful Indian legends. The rock-girt shores of the lake were the favorite walks of the Great Spirit. Here, according to the Indians, the maker of the world hid his treasures and gave them into the keeping of Missibizi, god of the sea. To this treasure-land, long ago, came strange people from the south—the mound builders and the Aztecs—for copper. To this 'shining big sea-water' came also, in a later day, those men of iron whose deeds make up the story of the Great Lone Land—a story that has never been fully told.

Ruins of stamp mill at Silver Islet.

It is with one of the hidden treasures of this lake that this story has to deal.

You who have been so fortunate as to take that most delightful of all summer journeys, the lake trip from Owen Sound or Sarnia to Port Arthur doubtless remember Thunder Cape, that bold promontory that guards the entrance to the twin harbors of Port Arthur and Fort William. No doubt your attention was called to Isle Royale, lying to your left as you approach the Cape, and you learned, perhaps, some of its interesting history. Perhaps, too, if it were a clear day, the captain gave you his binocular and directed your eyes to a low-lying island near the north shore not far from the base of Thunder Cape—a little island that seemed not so large as your hand, on which stand queer-shaped buildings, now partially wrecked and rapidly going to decay; but this you will not notice, even with the glass. Silver Islet, it is called.

Perhaps the captain told you of the lost mine beneath the lake; of the shafts and the levels that honeycomb the rock more than a thousand feet below the level of the water; of the tons and tons of silver that lay in sight when the cold waters of the lake 'jumped the claim' and took possession of all save the upper works. It may be you were told also, by the natives at Port Arthur, of the dull shocks that are frequently felt, accompanied by low, rumbling thunder, though the sky is clear—the ghosts of imprisoned miners blasting for silver beneath the sea.

It was, I think, in the year 1868 that a small party of miners prospecting for copper at the base of Thunder Cape, while surveying their claims, chanced to land on a barren rock about a mile from shore to plant observation stakes. This rock was about sixty feet across, and rose not more than four feet above the mean level of the lake. It resembled the dome of a human skull just rising out of the water.

Across this Skull Rock, as it was then called, ran a vein of galena, in which a few strokes of the pick revealed the presence of silver. A half-dozen powder blasts were sufficient to detach all the ore-bearing rock above the water line, but the vein was traceable some distance into the lake, where, through the clear water, large nuggets of silver were visible. These were dislodged with crowbars, the men working up to their necks in the ice-cold water. The game, however, was worth the candle, for the ore thus taken out, sacked and shipped to Montreal, assayed seven thousand dollars a ton pure silver.

The location was owned by the Montreal Mining Company, Limited, a company of conservative capitalists. In a way, luck had favored them, for here within their grasp was one of the fabled treasures of the lake. As far as human laws were concerned it belonged to them. But—and it was a big but—the Great Spirit had placed it within the keeping of the sea. For three hundred miles to the east there is nothing to break the great sweep of the wind. And when, at the call of the storm, the legions of the deep come forth, the little treasure rock disappears—utterly lost in the spume and froth of the breakers. Where was the man or the company of men who would presume to defy these giant powers and remove this jewel from its setting?

The men composing the Montreal Mining Company, Limited, were conservatives. They were willing and ready in the pursuit of wealth to raze hills and tunnel mountains; they were ready to sink shafts through the solid rock until they could feel the earth's internal fire. In such cases the opposition to be encountered could be measured and provided for, but they shrank from measuring their strength against the unknown power of the wind and sea. Therefore, they accepted an offer of $125,000 and transferred Silver Islet and a number of surrounding mining locations to an American syndicate headed by Alexander H. Sibley, of New York.

Here begins the active history of one of the world's most famous

Circle—Ruins of superintendent's residence.

Left—Burying ground at Silver Islet.

Right—Ruins of docks and breakwater, Silver Islet.

mines—a history more dramatic in its details than novelist ever conceived.

It seems that when an unusual task is to be performed—when a *MAN* is wanted—the time and necessity with unerring instinct bring him forth. Here was an herculean task, and the first throw of the dice turned up the man—a modest mining engineer—William B. Frue.

There is something strongly feline about Lake Superior—it is so lithe and soft and caressing. In August and September, and often later, it is usually in a peculiarly gentle mood. Like a great tiger it stretches itself in the warm sun and purrs and sleeps. It is so beautiful and seems so harmless; yet beneath this calm and gentleness you can see the giant muscles swell as the great cat extends and contracts its claws in pure enjoyment of its latent power.

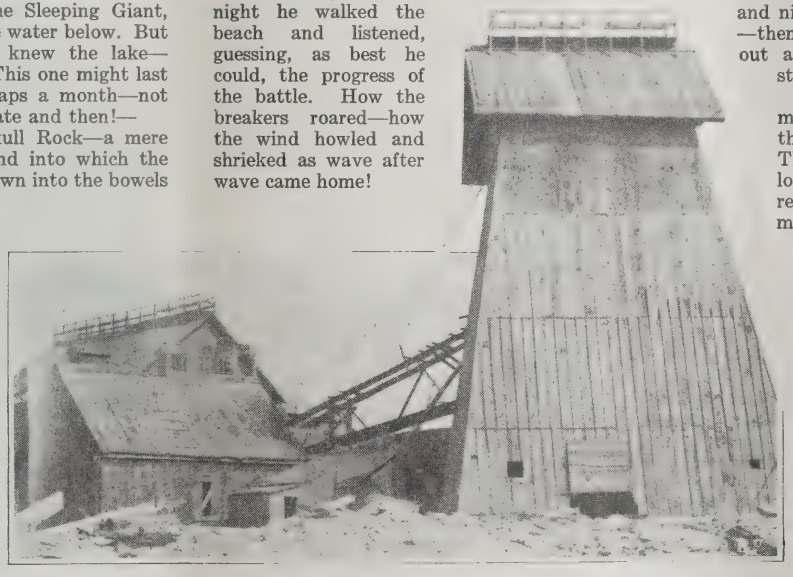
On one of these perfect days, September 1, 1870, Superintendent Frue, with machinery, supplies, a crew of thirty men and a great raft of timber, arrived at Silver Islet. There was not a ripple on the surface of the water. The basaltic ledges of Thunder Cape, even to the features of the Sleeping Giant, were duplicated in the water below. But Superintendent Frue knew the lake—he knew its moods. This one might last a day, a week—perhaps a month—not much longer at any rate and then!—

There was the Skull Rock—a mere foothold—a tiny island into which the shaft must be sunk down into the bowels of the earth while around and over it broke the angry waters of this 'brother of the sea.' To sink that shaft and guard it against the fury of the lake was Superintendent Frue's task.

It was finally decided to encircle the island with a crib of timber filled with rock to break the force of the waves, while a stone and cement cofferdam was to furnish protection for the immediate mouth of the shaft.

With feverish haste the work was pushed ahead; eighteen hours was a day's work. If only the cribbing could be got into place before the autumn storms began all might be well. One week, two weeks, a month passed, and still the great lake slept, unconscious of or in contempt of the puny efforts of the human ants on Silver Islet. Day after day the sun rose as out of a mirror, and sank unclouded behind the shoulders of the Sleeping Giant.

Five weeks! The cribbing was done, the shaft was being sunk and every day the precious metal was coming to the surface. Six weeks—seven weeks! The human ants were beginning to feel secure in their new abode. Then came the twenty-sixth of October.



It was three o'clock in the afternoon when the wind began to blow strong from the northeast. In half an hour the lake right to the horizon line was white with foam.

'It's coming at last,' said Frue, 'but we're here first and I think we'll stay.'

When the second shift quit work at six o'clock the waves were leaping the east breakwater, deluging the men outside the cofferdam. From the rocky shore of Thunder Cape came the boom of the surf, like a rolling cannonade.

The little plunging tug had just arrived with the third shift wet to the skin. The cribbing on the windward side was already trembling with the impact of the waves. Stubbornly to remain would be useless and might mean suicide. It was the first trial of strength, and the result to the mind of the superintendent was at least doubtful. Orders were, therefore, given for all hands to go ashore.

There was little sleep for Superintendent Frue that night. He had secured first innings; he had been given fair play; he had made his utmost score; now the sea was taking a hand in the game. All night he walked the beach and listened, guessing, as best he could, the progress of the battle. How the breakers roared—how the wind howled and shrieked as wave after wave came home!

Shaft house, Silver Islet.

Before sunrise the wind had died down, and by ten o'clock the sea had subsided to a sullen underswell. Frue promptly went out to the scene of the conflict, and his heart sank at what he saw. Two hundred feet of the breakwater had been carried away; the cofferdam was a partial wreck, and, as if in rebuke, the storm had filled the shaft to the brim with the rock of the cribbing.

The company had agreed to give Frue a bonus of $25,000 in addition to his salary, on condition that before September 1, 1871, the first year of operation, he mined and shipped ore to the value of $250,000—an amount to cover the original purchase price and the bonus. On the morning of October 27 that bonus appeared to Frue as distant as the moon. But under this apparently crushing defeat he lost neither his heart nor his head. He had learned something from the storm. He had learned something of the game as it was to be played by his antagonist.

All hands were put to work; the cribbing was repaired and strengthened, the cofferdam was restored and the debris removed from the shaft. The sea remained quiet. Mining was resumed and by the last day of November, when navigation closed, the plucky superintendent had the satisfaction of knowing that $100,000 worth of silver ore had been shipped down the lake to Montreal.

Hardly had the vessel with the last shipment got away when the mercury dropped to ten below zero. The lake froze heavily in places, and then from the southeast came another storm

It was a flank attack and this time the sea, as if maddened by the persistence of the invaders, brought up its artillery and hurled tons upon tons of ice against the cribbing which crumbled like an eggshell before the tremendous onslaught. But this awful battering defeated its own purpose; the accumulation of ice soon formed a breakwater against which the waves beat out their fury. For three days and nights the storm raged—then the sea smoothed out again and Frue took stock of the ruins.

The cofferdam remained, but most of the cribbing was gone. The foreman, after looking over the wreck, remarked, 'You can't make anything stop here.' But Frue thought differently.

Nature is the greatest of engineers, and he who would oppose her must adopt her plans and be ever ready to profit by a hint. The ice gorge gave Frue the key to the situation. Taking advantage of the winter and the ice he threw out a breakwater facing the southeast. The structure had a base of twenty-five feet, rose twenty feet above the surface of the water and was backed by cribbing filled with the debris from the mine.

Work was prosecuted both underground and on the defenses with little interruption until March 8. Then the lake gathered its forces for what seemed not only another assault, but the commencement of a campaign of annihilation.

Masses of ice as large as the island itself were hurled against the groaning fortifications which were soon driven bodily up the incline toward the center of the island. Wave after wave leaped the breakwaters and it seemed that the lake would at last succeed in regaining the whole of the lost territory and in driving the invaders permanently from the ground.

Storm succeeded storm during the entire month, each assault more terrific than the last. There was no rest for the miners, day or night. Every interval of calm was employed in repairing the breaks and in strengthening the weak places. At last, apparently defeated, the great lake withdrew its forces and the superintendent for the first time saw in his mind's eye the $25,000 bonus—and it was not far away.

At the close of the first year the clean-up showed a gross output of nearly one million dollars. The bonus was immediately paid.

There seemed to be no longer any danger from storms. From all appearances the lake had given up the contest—abandoned the treasure to the spoilers, who during the next two years took out another million in silver.

*A Rock Which Became Transformed*

Silver Islet had become one of the wonder-mines of the world. The little island—the bare Skull Rock—had grown in the meantime to ten times its original size. It extended to the outer breakwaters and supported not only the upper works of the mine, but machine shops, storehouses, and permanent quarters for certain employes of the mine. From the eastern angle rose a lighthouse, while on the lee side were built great docks and breakwaters for the protection of the now important shipping. On the shore a town had sprung up—a town with churches and a schoolhouse, great reducing works, clubrooms for the miners and neat cottages for the families of five hundred workmen.

Frue was the magician who had wrought the change. He had found a barren rock a mile from the shore of a howling wilderness, and in three years had made it the center of one of the most important enterprises on the continent. The treasure he sought was guarded by the most powerful and treacherous of natural foes, but he had met every emergency and at the end of three years was the apparent conqueror. But Nature never gives up a battle.

Ages ago, as if in sentient anticipation of what was to come, the lake had run a countermine underneath the island. The main shaft had reached the depth of 300 feet when this countermine was struck. The imprisoned waters, under the enormous pressure, leaped forth fiercely, driving the miners from level to level. Despite the work of a four-inch pump, the water rose at the rate of ten feet an hour. Another six-inch pump was installed, but the two, working day and night, could barely keep the waters below the fifth level. An order was dispatched for a pump with a twelve-inch plunger, but before it could arrive the lake made one more effort to demolish the upper works. A double attack from above and below seemed to have been planned. All previous storms were dwarfed—they were mere zephyrs compared with the hurricane that now swept down from the northeast. A breach was at once made in the breakwater and sixty feet of the structure carried away. Before the damage could be repaired another assault carried away 360 feet of the cribbing with the blacksmith shop and 5,000 tons of rock. So violent was the wind that refuse 'rock flew about the island like hailstones.' Fortunately, the machinery remained intact and the pumps were kept going. At last the storm died away, the mammoth pump arrived and slowly the waters in the mine were put under control. It was a well-planned attack and the defenders won by a margin so small that an accident, however slight, would have turned the scale.

*When the Output Fell Short of Expenses*

It was soon after this that Superintendent Frue left the employ of the company and disappeared from its history. The fortunes of this remarkable mine for the next ten years need not be recounted. It differs but little from the history of other mines. Deeper and deeper drove the shafts and wider and wider extended the stopes and levels. In constant fear of the sea and wind above and the water below the work went on. Some years the output ran into the hundreds of thousands. Then, again, it would hardly pay expenses. At last there came a year when the output fell short of operating expenses. The indications were as good as ever but somehow the ore in hand did not seem to pan out well. The stockholders were called upon to make up a deficit. There was grumbling and dissension. Rich ore to the value of a half-million dollars was visible in the roof of the first level, but its removal had hitherto been regarded as dangerous. Now, however, plans were decided upon for putting in a false roof and removing this lode.

*A Day Came When the Fires Went Out*

The main shaft had now reached a depth of 1,300 feet below the lake level. Gigantic pumps, driven by powerful engines, were kept busy holding back the insidious sea. Storms might come and wreck the upper works, but storms subside and the ravages of the waves can be repaired; but this eternal assault from beneath could be resisted only by a tireless energy that never slumbered. Let the throbbing engines cease their work—let the pumps but stop for a day and the battle of years would be lost.

It was November, 1884, and the coal was running low. Only a few hundred tons remained in the sheds on the island and the hungry furnaces would soon devour that. But more was expected any day—the winter supply had already left the lower lakes—it should be somewhere on Lake Superior now. Day followed day—and it did not come. It was getting late and navigation might close at any time. Work went on as usual; some slight accident had delayed the steamer. The coal was sure to come the miners told each other.

Day and night was heard the monotonous thud, thud, thud of the pumps; but all the time the coal was getting lower—lower, and the sea was waiting—waiting.

It was an anxious Christmas for the folk of Silver Islet—that Christmas of 1884. There was hoping against hope for the arrival of the looked-for steamer. What if it should not come? Could it come now? The cold was intense and already the ice had formed six inches thick in the bays and the ice field was creeping out into the lake, from which rose, like steam from a mighty caldron, huge banks of cumulus clouds.

The New Year came—January 1, 1885—and no coal. But instead there came a dog team from Duluth bearing the bitter news that a drunken captain with a cargo of a thousand tons of coal for Silver Islet had allowed his vessel to be frozen in the ice at Houghton. The furnaces were put on half-rations in the vain hope that something might happen to bring relief. But at last a day came when the fires went out, the pumps stopped and the *exultant sea reclaimed its own.*

Thirty-seven years have passed since that fatal day—a generation has come and gone—but no attempt has been made to fight back the sea and reopen the mine. The island and the village that once stretched for a mile along the shore are abandoned and desolate. The great engines and hoisting machinery on the island are rusting where they stand. The lighthouse has long since disappeared. The docks and breakwaters are rotting. They are at peace with the sea which, in contempt, has given them over to the slow torture of time. Down in the drifts and galleries where men once worked, fishes stare with unblinking eyes at the slimy walls. On the mainland the great reducing plant with its batteries of stamps and vanners is rapidly going to decay. Grass and briers grow in the abandoned street and at night hedgehogs hold high revel in the silent church and owls hoot from the rickety tower.

*The Desolation of the Deserted Workings*

Why has this mine with all its possible wealth of silver ore been left in the possession of the sea? I do not know. The old caretaker once told me strange stories of strange doings. He told me that sometimes when the air is full of light—when the wind sleeps and the placid sea reflects the great blue bowl of heaven—the surface of the lake will suddenly heave in long low swells and then smooth out again. Then, as from the depths of the earth, come low rumbling sounds, muffled and indistinct—like a far-off cannonade. He told me, too, that at night, when the storm comes from the east and the air is filled with blinding wrack, ghostly lights flit about the treasure island, and in the lulls of the wind you can distinctly hear the rumble of a hoisting cable and the rhythmic pulsations of a ghostly engine.

I fear that years of almost uninterrupted solitude may have warped his imagination. Be that as it may, the fact remains that this silver fleece is still guarded by a dragon that never sleeps—the omniscient power of the sea.

## In Real Peril at Sea

THE steamship was about to cross the seas on her maiden trip.

Our steward was a Dane by birth, but naturalized. The steward's duties, he verily believed, were the most important functions on the ship. We were in a gale in the North Sea. Our steering gear had broken down. The ship was heavily rolling in the trough of the sea and green waves swept her decks. Our danger was in a shift of the coal cargo which might cause the ship to heave over on her side. The captain, mate and engineers were aft under the poop deck improvising some method of steering. The heavy seas broke into the steward's store room, upset things and deluged food supplies with water.

The steward, who seemed heretofore to have been unnerved by any sense of peril, crossed the lower deck, in water sweeping up to his knees, and alarmingly breaking in upon the officers: 'Captains! Captains! Eberyting in de store room is downsides up! Der beans is all spillit! What vel ve do? You hab no more beans yet 'till ve gets to Gotenburg.'

'Get out of here,' cried the captain.

'Maybe, maybe, Captains, it vell be so; but I tinks I tell you that you hab no more beans till ve gets to Gotenburg yet. Der is all spillit yet.'

He would probably so have reported if the ship had been sinking. To be without steering apparatus was less of a peril, perhaps, thought the steward, than to be without beans—*'all spillit yet.'*

# Chats with Office Callers

'Mellon put Vare across,' *said The Washington Newspaper Correspondent,* as he sat in The Office. 'No one who was in the know had any expectation that either Pepper or Pinchot had a chance. It was all settled months ago.'

'But,' we remarked, 'it was understood that Mellon was backing Pepper.'

'So he did, openly,' replied the Correspondent, 'but really he backed Vare. It is not where Mellon lets the public think he stands, but where he really stands, that counts in Pennsylvania politics. The Mellon organization understood the line-up pretty well. Mellon gets credit for backing Pepper, who is at least respectable, but he actually backed Vare, for Vare is a typical back-street politician. It is reported that Grundy, who is head of an association of Pennsylvania manufacturers, "double-crossed" Pepper after arranging the alignment between him and Fisher, candidate for governor. Grundy is said to have supported Vare in return for Vare votes for Fisher. It sounds plausible. The Vares made their début in politics via the street-cleaning contract route. Ed was the brains of the family. Bill, the newly nominated senatorial candidate, is important because he holds the purse-strings; otherwise he is quite negligible. He will do what Mellon tells him. It now remains to be seen whether Mellon is the Penrose of Pennsylvania and can put Vare over.'

* * *

*The Young Rover from Britain* dropped in to tell us about Sir Robert Baden Powell's new get-together movement. But first of all we asked him about the recent general strike. 'It was the most idiotic thing ever heard of,' he exclaimed. All these men in different trades being in the same so-called union, and therefore having to quit work over each other's disputes and thereby starve themselves. A hunger strike in fact. The miners themselves were not consulted about the matter; the leaders called out everybody without asking them. The workers meekly obeyed despite the consequences, and yet they say "It's a free country."

'No wonder "B. P." the Chief Scout (recently a visitor in Detroit) is anxious the Rover movement should spread, for here he encourages men to think for themselves, to read two sides of every question. The Rover movement is a socialistic movement in the true sense. Employers and their men hike together, camp together, play together. They follow the Fourth Scout Law which holds that a scout is a brother to every other Scout no matter to what social class the other belongs.'

'That is not the Communist's creed,' we remarked.

'No,' said the Rover, 'the Communist says: "If you've more than I have, give me some of yours, but if I've more than you, keep it." Of course they don't put the last bit in words; it's understood.

'As the Chief points out, "If the other fellow has more money than you, don't worry: you'll enjoy your week-end hike just the same."

* * *

'The annual circus season this year will lack one of its greatest thrills for the children,' said *The Stroller* as he sat in The Office.

'The circus parade, it has been decided by showmen, is to be abandoned. High-priced performers, especially the Europeans, will not parade. Big circuses now visit only the large cities, and traffic problems and the distance of the circus lot from the railroad make the parade extremely difficult to carry out. Ten years ago there were twenty circuses with a train of ten or more railroad cars. Now there are only a dozen, but these have expanded until the largest circus in the country travels with 1,500 persons and the smallest ones carry about 600.

'Virtually all of the circus people come from small cities, probably because in the early days of the circus the performances were given mostly in the smaller communities and the small boys of those places caught the circus fever. Then, too, the small-town boy had a barn in which he could practise on the trapeze. In the garage of the city boy's father there is no haymow to flop in. The canvas top somehow discovers the gypsy in every one of us.'

* * *

'The automobile is somewhat of a craze now,' said *The Super-Salesman as he discussed the business outlook,* 'but the time is rapidly coming when a motor car will be just plain transportation. A lot of trinkets are being sold now in motor cars, but soon there will be nothing sold but transportation. Nowadays there are many people who regard a car as a Mexican regards his saddle—something to be dolled up and shown off. They would braid the tails and weave ribbons into the manes of their cars, if they could. A good many cars are being sold on that principle. But I think that there is a change coming. The very pressure of traffic is going to push the motor car into the classification to which it really belongs—that of transportation. Just now it is partly in the classification of personal adornment, or dollar frontage. What do I mean by dollar frontage?—why, something that shows off its price more than its quality. As our streets become fuller of traffic, as the country becomes farther away, the tendency is going to be to buy a car because of the transportation it can give, the miles it can deliver. That is what people will buy when they buy a car—they will buy transportation. It will mean a considerable readjustment in the over-stuffed car industry. Delivery of transportation, instead of putting your friends' eyes out with excessive style, will be the rule for motor purchases then. A car will just be a machine to take you from one place to another.'

* * *

'There are few deaf and dumb people,' said *The Teacher in a metropolitan school for the deaf.* 'Most deaf people used to remain dumb, because speech is imitative, and if a person never hears speech he will not naturally use it. But in our schools we take the little deaf children very early and save them from becoming "dumb" also. We teach them speech, and they become as proficient in conversation as those born with a normal sense of hearing. Then we are able also to neutralize most of the conditions of deafness. We teach lip-reading which places the deaf in a position to understand conversation and addresses wherever they may be. We teach them to interpret the vibrations of sounds—high sounds and low, far and near. That is, we are able through the development of other senses to place them in communication with their environment in the tone world almost as if they had the faculty of hearing. And their brightness, their patience, their eagerness and strength are very winning. It is very wonderful that our municipal educational institutions can now prevent deaf children from becoming dumb also. Dumbness is so seldom due to a defect in the voice-producing apparatus, and is so often the sign of neglect.'

* * *

*The Man from Yellowstone* dropped into the office on his way West, to talk over plans for the summer. 'The tourists are our first care,' he said. 'The important thing is to show them a good time, make them glad they came and all that. To do this we have guides to take them around the hot springs formations and the geysers; we have rangers who look after the sage-brushers' (automobile tourists') camps to see that everything is shipshape; we have men always on duty to give them information about the Park. And then of equal importance—we must see that the tourists don't harm themselves, or damage the Park in any way. Hence all firearms are sealed when they pass through the gates. We impress upon them the dangers of fire—and one of the greatest offenses a tourist can commit is to leave his camp fire burning. We warn them against going into the higher altitudes if they haven't had their blood pressure taken. We patrol the roads of the Park for speeders. A few years ago a party of officials from one of the mid-European countries toured the Park. They were most anxious to study American efficiency methods at first hand. One hot afternoon they were stopped about halfway between Old Faithful and Yellowstone Lake. A ranger explained that he had just discovered a brush fire a short distance from the road. It wasn't a large one, but there was danger of its spreading. *And,* the ranger added, *it was a Government regulation that all passers-by should be impressed into service.* The European officials looked a bit startled but were good sports, and they pulled off their coats and went to work with spades and other implements. At the end of an hour the fire was out and the ranger thanked them and allowed them to proceed on their way. When they got back home they spoke highly of the American way of getting things done.'

## *In His Steps* Brought No Wealth

(*Concluded from page 2*)

would never have published it have issued it in million lots so that it has been available for the common people because there was no royalty to pay.'

There have been some curious things about the hundreds of editions and translations of *In His Steps*. Dr. Sheldon has several cases full of these translations.

I think that the most curious he showed me was the translation made by a Methodist missionary in Buenos Aires. It is a Spanish translation and was made by Dr. Dan Hall on March 24, 1925. The book starts off in this way:

*The Book Is in Persian and Esperanto*

> 'It was Friday morning and the Reverend Henry Ford was trying to finish his Sunday morning sermon.'

As every reader of the English version knows, the name of the minister is Henry Maxwell. But Dr. Hall, writing to the author, Dr. Sheldon, said: 'I am not using the name Henry Maxwell because nobody down here knows Henry Maxwell but everybody knows Henry Ford, so I am using his name as the preacher in your book.' The way the Spanish name reads in the translation alluded to is: 'Reverenda Enrique Ford.'

A translation made into Armenian had a tempestuous career. The Turkish censor made the translator take out of the book every word that alluded to freedom for women, or liberty, or anything even remotely referring to freedom of speech or a republican form of government. Professor V. H. Hagopia, of Anatolia College, translated this book for the Armenians.

The book has also appeared in Persian and Esperanto.

Dr. Sheldon tells me that between June of 1897, when the book was first published, and August of the same year, sixteen publishers who thrive on defective copyrights had put out editions.

A hurricane of argument and discussion was stirred up over the teachings of this unusual book. Pulpits became forums of discussion with *In His Steps* used as the text; church and secular newspaper editors used it as an editorial theme. The *British Weekly* for several months carried on a discussion of the theological aspects of the principles of human conduct based on an attempt to follow Jesus. Labor and business had its fling at the book. One preacher in a non-conformist church gave a copy to every member of his church, nearly a thousand in all. One enterprising grocer in Glasgow had a special edition printed and put the name of his store at the bottom of every page as an advertisement.

*Author Flooded With Begging Letters*

In Great Britain alone the combined sales of more than thirty different publishers who issued the book amounted to 10,000,000 copies

Immediately Dr. Sheldon began to be flooded with begging letters; some of them peremptorily demanding financial help. They took it for granted that an author whose book was selling by millions was wealthy. They would say to him like the snap of a verbal begging letter's whip: 'Brother, what would Jesus do about this demand I make for money? Surely you cannot imagine Jesus keeping all the wealth you are getting from this book.'

After twenty-nine years of history, this book, *In His Steps*, still seems to be as much alive as ever. During the past year one firm alone has printed and sold 150,000 copies. During the past year also legal complications about the motion picture rights have been cleared up, and Dr. Sheldon is negotiating with one of the largest firms in the motion-picture world about putting it on the silver screen. Will Hayes tells Dr. Sheldon that the picture world wants his story. This company paid $20,000 just to clear the title for screen production. Through the efforts of Ralph Waldo Trine, who spent several weeks in Washington, D. C., on this specific errand, the librarian of Congress determined that Dr. Sheldon had a legal right to the motion picture production of *In His Steps*.

'How do you account for the wide circulation of your book?' I asked Dr. Sheldon.

'It is because people are incurably religious. This is the reason for the book's immense circulation. *Ben Hur*, *The Pilgrim's Progress*, and books of a distinctively religious nature, but with a fiction or an allegorical background always have a large circulation.

## Sixty Years of Negro Freedom

(*Concluded from page 8*)

comed with cordiality. A wave of 'equal justice' spread over the North. Everything was open to the black man just as to all other men. This was true in New York, Philadelphia, Boston, Washington, Cleveland, Detroit, Chicago, many other large centers, and many small centers. The negro was 'inchin' along,' as goes the phrase in an old plantation song. Progress was made in the North and in the South. There was not only economic progress in the South, there was political progress; and this likewise was true of the North.

A little more than twenty-five years ago reaction on economic and civic opportunity began to set in in the North. The bitter feeling between North and South was being sweetened by the sugar of time. Northerners began to go to the South for investments and recreation during the winter months; and white Southerners began to come North for economic opportunities and recreation in the summer.

*Migration Record Is One of Stumbling*

Then came the World War, and negro migration. Those years marked a new epoch in negro development.

I visited the gate cities of the South, and strange sights met my eyes when the trains unloaded in the morning. Some were pathetic, others amusing. I have seen entire families, without any definite destination in mind: 'We're jus' goin' No'th so we can git work an' sen' our chil'len to school,' they would say with a faith of the future that was astounding. There would be entire trainloads of negro men, not one of whom knew his destination. They had been hired by agents and were going 'somewhere in America.'

Unlike the usual efficiency with which the American white employer masters a big proposition, the migration record is one of stumbling. There is some excuse for it. The war was on; building operations had been stopped by the Government. All attention was turned to the output of the necessities of war. But these people had to live somewhere. The colored sections of various cities could take care of a convention or conference of a few hundred people for a few days, but when it came to adding thousands to the permanent population that made a real problem, from which we have not as yet emerged.

*It Is Still a Matter of Adjustment*

Amusing and pathetic as were the sights at the railway stations, these did not compare with what happened in the efforts to house the new people. Every kind of a building was turned into a sleeping place. Numbers were compelled to sleep in cramped quarters, under most undesirable conditions.

Finally, came the realization by both black and white people that 'this condition must be worked out with system and determination.' The war closed, the soldiers returned from France, the restricted immigration act was passed by Congress, and the American negro remained, and still remains, an economic factor in this country.

This being the case: Where do we go from here? All of it is still a matter of adjustment. As I have gone about through the cities of the North and compared the present-day conditions with what I saw following the immediate time of migration, there has been commendable progress and adaptability. Living conditions have greatly improved; there is better housing, the spirit of religion prevails, all churches are crowded. There are savings accounts in the banks, and the children are sent to school.

We negroes have a definite part to perform. It matters not in what section of America we may live; our responsibilities have increased. It is necessary that we measure up; it is necessary that we develop our powers of resourcefulness with greater efficiency. This applies to the leaders as well as to those who belong to the masses.

## If Not America First—Who?

(*Concluded from page 7*)

soldiers who went willingly overseas to fight Democracy's battle in the World War want none of Europe's quarrels or battles wished on them. It is sufficient for them to fight America's battles. It is significant that practically without exception those who clamor loudest for the League of Nations to 'force' peace are the ones who were the farthest away from any action in the World War to 'force' peace.

As a volunteer who did his bit here and over there, I am willing to give other persons in America the right to go abroad and fight the battles of any nation whose interests they may have so much at heart that they would lose good American blood for it. But when they insist that their fellow men, good Americans, be used as cat's-paws in fights in which we have no real business—I draw the line there.

The most powerful factors for American peace and well-being are the Monroe Doctrine and the principles of Washington and Jefferson and every other great American who has contributed to the greatness and glory of this nation. Once we are lured into a lesser league than this, we let down the bars to the American continents, and lay South and North American nations undefended as possible subjects of European control. Our contribution to World Peace is the Monroe Doctrine which for two generations has kept the peace of half the world.

If we want to use any moral influence in the world, let it be by example as in the past—or if it be by force, let it be force which *we* decree is necessary and not what some *other* nation shall decree for us.

# America Leads the World in Psychology

(*Concluded from page 4*)

Dr. Lillian M. Gilbreth, authority on 'motion study' —unfatiguing methods of working.

in the realm of 'pure' psychology. Their numbers are small, however, and in nearly every instance they have been trained in European laboratories.

It is not uncommon to hear it said that these 'pure' psychologists owe their purity not so much to having been trained in foreign fields as to a lack of ideas with which to develop something useful; often followed by a knowing shrug and the remark: 'You know how easy it was to obtain a doctor's degree when Pan-Europeanism was striving to develop an educational grasp on the world.'

And perhaps they will relate the famous instances of American students who have entered graduate universities in Europe presenting insurance policies as their American diplomas.

The flair for the practical has characterized American psychology from the start, but it is to a German psychologist that the stimulus toward industrial applications is traced. This German psychologist, however, like my friend, *came to America to do his major work.*

***America Gets Results Out of the Abstruse***

The way America acts as a handmaid bringing practical results out of the abtruse is remarkable. Take the work of Pavlov, in Russia, on conditioned reflexes. Pavlov, master worker that he is, seemed unable to rise above the level of guinea pigs and dogs as experimental subjects. In contrast we find Hulsey Cason, who is now at Syracuse University, adapting the experimental work on conditioned reflexes to human beings and bringing into relief practical applications of which Pavlov perhaps never dreamed. We find John B. Watson working in the same field but applying it to children's fears. America is a practical, not a theoretical, handmaid.

In the case of mental disorders, we note Freud and his followers in Vienna making contributions, important enough, but withal highly unscientific and at times very mystical. In Germany there was Emil Krapelin and his followers who indulged in orgies of diagnosis.

But at St. Elizabeth's Hospital in Washington there was Edward J. Kempf who brought psychoanalysis 'down to earth,' out of mysticism and onto physiological foundations. There are Morton Prince, of Boston, and the late Boris Sidis, who contributed fundamental discoveries to the advance of ameliorating mental disturbances.

On a grand scale Clifford Wittingham Beers, of Connecticut, conceived and organized the National Committee for Mental Hygiene, which has now spread to other countries. The sex orgy of Freud and the diagnostic stickling of Krapelin have been turned by them to a most beneficial and practical use.

In the psychology of learning, E. Meumann's book is still widely used. The Hamburg professor, however, is somewhat overshadowed by William F. Book, of Indiana University, who has just had two books on learning republished almost twenty years after their first appearance. The contrast of the practical and the pure is again brought into relief since Meumann studied learning with such highly practical things as nonsense words like *neh, yxh,* et cetera, while Dr. Book studied typewriting and telegraph operating.

***Testing Fitness by the Aid of Psychology***

My friend who left a famous Continental university to come to the mid-western college, is paralleled by a worker in the field of learning, the late J. Crosby Chapman, who was so tragically drowned in Lake Chautauqua last summer. Chapman was English born and received the degree of Doctor of Science in the University of London. But to Columbia University he came and studied under an American psychologist, Edward L. Thorndike, and contributed to our practical knowledge of learning, both in typewriting and in the public schools.

One of Dr. Chapman's last students is now doing practical work with a large electrical manufacturer in New York City. Every summer Dr. Chapman visited his native England, but *he returned to America for his psychological work.*

The most striking differences are to be observed in the field of psychological tests. A score of years ago these were started by Alfred Binet in Paris; by Henry H. Goddard, now of Ohio State University, Lewis M. Terman, of Leland Stanford University, and S. A. Otis, of Yonkers. Psychological tests have been developed in America to a degree that leaves other countries almost entirely out of the race.

During the war these were adapted to use in our Army, by Robert M. Yerkes and associated psychologists, and contributed much more than any of the psychologists would admit, to an effective fighting force. Scarcely any use was made of this valuable psychological work in any of the other fighting forces.

Aviators in some of the armies were given cursory tests, of a most unscientific nature. But in the case of American aviators, psychologists such as Edward L. Thorndike and V. A. C. Henmon, of the University of Wisconsin, experimented with a wide variety of tests to find those which most successfully predicted aptitude for flying.

In the other allied armies little, oftentimes no experimental work was undertaken. In its place a group of psychologists talked things over and decided on the basis of attempted pure reason what tests *might* predict flying aptitude. The tests this armchair group of psychologists selected were discovered by the American experimenters to be the least useful of all.

***A Neglected Field of Research***

America is just that cynical of authority. It is this experimental cynicism which has been one of the most effective aids to genuine progress. Wundt speedily became an authority; his words—for a time—were looked upon as revelations from an oracle. The only authority to which the majority of American psychologists bow is the authority of practical, valid, laboratory findings.

This is mirrored in the fact that each year from American laboratories there are published nearly as many pages of meaty, experimental reports as from all the other laboratories of the world combined.

In one respect America is a poor handmaid of psychology. Research funds, oftentimes enormous, are established in foundations for the advance of other sciences, such as chemistry, physics, and biology. Psychology, which has not reached the peak of its practical advance, does not have the very material and needed assistance of such special funds.

# Coffee Joys

## without any

# Coffee Harm

Kaffee Hag is just pure coffee with the caffeine taken out. It is coffee at its best, with all the flavor and aroma of a delightful blend.

Its high quality alone has led countless homes to adopt it. The finest hotels now serve it.

Caffeine is the drug which limits coffee, or forbids it, to so many. It often affects the heart or kidneys. It keeps one awake at night. Millions. to avoid it, have been forced to drink substitutes.

Now a superlative coffee has the caffeine taken out, without altering the taste at all. One may drink it—all he wants—without a thought of harm.

In almost every home someone wants Kaffee Hag. Send the coupon with a dime for a 10-cup package. Learn how all enjoy it. Clip coupon now.

The Point to Be Understood Is That Children Are Very Much Unlike in Ability, and That Some Are by Nature So Weak in Certain Directions That They Cannot Accomplish Much

# Should Children Skip Grades?

By MYRA CARY

EVERYONE who has paid any attention to school work knows that as a rule the work is carried on for the greatest number, that is, the average pupils. As the state policy is now usually planned there may be specialized care for the lower group; but what about the waste of human material, the potential leaders, inventors, initiators of new movements, of new ideas? Usually there are too many children in a classroom for a teacher to make small group or individual instruction possible. Furthermore, the average teacher does not know how to deal with children of the highest intelligence.

Teachers all over the United States are awakening to the deterioration of the better ten per cent of children through neglect, through boredom, through work too easily done, so that idle habits are engendered and low ideals of effort fostered. The hope of our schools lies in great part in the willingness with which teachers accept instruction and information from leaders in education, from supervisors whose vision and experience are broad. The reader may have the common belief that 'genius will out,' but while this may be true of certain types of genius, it is not true of other types, especially of the grades of intelligence below genius, ranking in the talented class.

In a number of schools attempts are being made to give these abler children additional work, not so much in advance as of wider scope. The whole process is tentative and experimental. Naturally and wisely methods will vary in different localities as teachers find individuals or groups to direct. Much depends also on whether the teachers' classes are of the maximum or minimum size.

One principal told of a class of fifteen who had gone on together and whose record she had followed all through the grades, high school and college. As was indicated, they kept together all through their schooling and finally, as the records have it, every one is occupying a fine position. This speaks well for the sympathetic follow-up interest of the principal with whom their school work started.

The alert and watchful teachers, keeping abreast of the developments of modern psychology, are ready to break custom in favor of the children in their charge by providing opportunity for broader work and more varied activities outside the required course.

Even in the first grade, those children who learn to read easily are given in some good schools a great variety of books to read. Sometimes they read as many as thirty first-grade books in their first year. A second-grade group of fifteen children who had been selected because of their ability to read, their health record, punctuality, and regular attendance were at the end of the second year promoted to the fourth grade, skipping the third entirely. The report from them after doing ten weeks of fourth-grade work was that they were in the upper half of the average of all the fourth grades in the city.

At the present time the tendency is rather to give those able to take it a wider range than to promote them to a higher grade. The idea behind the practice is to keep the child with those of his chronological age for social reasons, in other words, companionship.

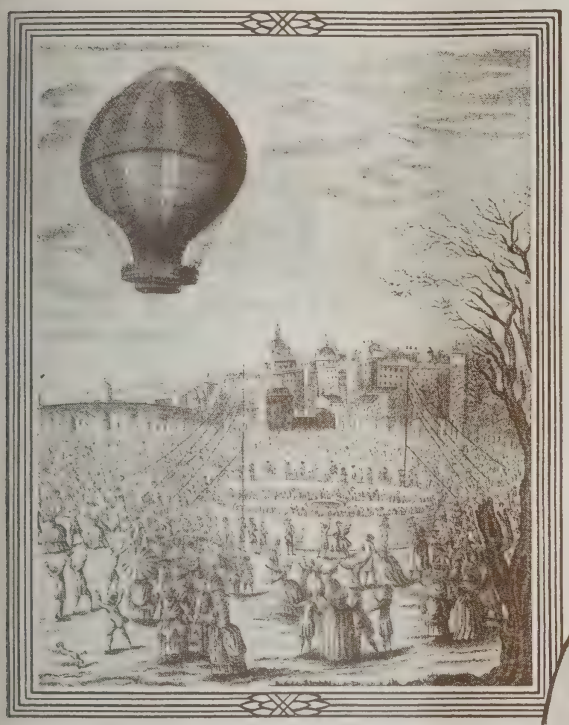
There are others who think that where groups of children can be promoted together it is better to let them do increasingly difficult work. This is no doubt correct within reasonable limits.

Too many persons are governed by the theory that genius will out, as before stated, despite the lack of encouragement or opportunity; that ability will break through without special attention. One is reminded of a young woman who is making a successful business venture in raising poultry. She says:

'I find it necessary to confine myself to one breed of chickens because the different breeds need such different treatment and care that the successful management of one kind is all one person should attempt.'

Children with different traits need different treatment to bring out the best there is in them.

A boy of ten and a half had done excellent work in the fifth grade, so very good indeed that his teachers wished to have him skip the sixth and take up seventh-grade work; but while the boy was pleased at the recognition of his work it was a debatable question with him because he would be captain of the elementary baseball team and also champion swimmer if he took the regular sixth-grade work. If he were to go into the seventh grade, which would place him in the junior high school, he would lose his superior position in sports and lose the companionship of the children of his age with whom he had been associating.



He was advised by his friends not to skip the grade. As it happened in his case, there was every chance and incentive for him to widen his course and at the same time he wished to take up music so that his time would be well occupied. One must take into account the beneficent effect of success as well as that of striving.

In at least one school there has been provision made for those children who finish the regular assignments to take up any line of work that pleases them in the extra time they have. Four of the boys went into radio-phone study, its history and uses, searching in magazines, catalogs, at the supply shops, everywhere, for information. Four of the girls were interested in newspaper work and ran a little school newspaper. One girl liked dogs very much and read all she could find about dogs. Finally she wrote a clever original story about a dog. These are only a few of the activities of this class. The characteristic of them seemed to be that they wanted to work in groups.

There are a few who have unusual gifts in one or more directions. Such persons are talented. If the particular gift is multiplied over and over again, as musical or mathematical ability or any other, beyond the powers of ordinary people, we have the genius—one perhaps in a million.

When society becomes fully aware of these facts the upper ten per cent will doubtless be aided in all that society can aid, bringing out talent and genius, and making them available for the social welfare.

# Pioneer Aerostatic Experiments Recorded on Old Prints

AT Lyon, France, in 1784, this novel balloon, 100 feet in diameter, made a successful ascension. A few lines in French, translated, read:

'An infinite space separated us from them;
But, thanks to Montgolfier, whom the genius inspired,
The eagle of Jupiter has lost his Empire
And the feeble mortal can approach the Gods.'

Oval, below—

'FLYING vessel' of 1784 was equipped with ingenious safety devices in the form of a parasol and wings. The balloon, 26 feet in diameter, was made of silk, coated with a new composition.

Above—

BLANCHARD and Jeffries in their balloon crossing the English Channel in 1784. A French verse taken from this old picture reads:

'Two peoples divided by the Empire of the Sea,
Until today did not possess the franchisement of the air;
Fortunate augur of a sincere union
Which will govern them for the good of the earth.'

DURING the ascension of Montgolfier's first balloon in 1783, a sudden rainstorm is said to have carried the balloon upward 20,000 feet, where it burst. It lighted at Gonesse, ten miles from its starting point, where the inhabitants, believing it to be the skin of a monstrous animal, assailed it.

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL
B-41

'I AM sending you a little book about Emerson. It is time you were beginning to take a little interest in thoughtful things, and you will find in this book some remarks on style that may be profitable to you. Another thing—when I make a remark or a suggestion, don't take it too seriously. All I can do is to give you some of the results of my experience. I am much more interested in seeing you grow up strong-bodied and clean-minded than I am in your career.—I should like to see you with a will strong enough to resist all forms of temptation. Your career will then take care of itself. And yet I shouldn't like to see you puritanical and narrow-minded. I want you to grow up to be a wholesome, hearty, liberal-minded individual.'

*—Joel Chandler Harris to his son when a schoolboy.*

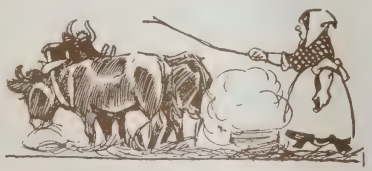
CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

LIFEBOATS ARE NOW being fitted with small cabins, in which are installed wireless transmitting and receiving sets.

THE AVERAGE AMERICAN workman produces as much in one hour as a Frenchman does in four or five, according to a leading French engineer.

WOMEN LIVE LONGER than men because of the sheltered lives they lead, a London specialist declares. He points out that of a total of 382 deaths of persons over 90 years old, 278 were women.



AN INDIANA JUDGE has ruled that in future truancy cases he will sentence the parents to one day in the county jail for each day their children miss school without good reason.

NO ONE IN FRANCE is permitted by law to earn more than $20,000 a year, as an unforeseen consequence of the recent tax bill voted by the government.

TWENTY-THREE PER CENT of all wells drilled for oil are failures.

MOUNT ETNA, the famous volcano, is densely populated, each of its 800 square miles of inhabitable slope containing 800 persons.

A CHINESE TYPEWRITER, capable of inscribing the thousands of ideographic scripts of that language, has recently been devised by a native of Shanghai.

THRESHING IS DONE in Turkey by women, who drive oxen hitched to a heavy curved plank over the grain.

THE SCOTS ARE GENERALLY regarded as a thrifty race, but as far as savings-bank figures show, England and Wales are in advance of their northern neighbor.

THE UNITED STATES possesses forty per cent of the world's railroad mileage. Persia, on the other hand, boasts only one railroad.

MONEY IN CIRCULATION in America increased from $34.36 per capita in 1913 to $50 in 1920, and now is $42.

THE ANCIENT EGYPTIANS had divorce laws and alimony, and well-to-do brides protected their fortunes by marriage contracts.

EIGHTY-SEVEN DISTINCT dialects are spoken in the Philippine Islands. English is now the dominant language, having supplanted Spanish.

UNDER EXISTING conditions, the world will double its population in sixty years.

SPECIAL BEDS, TABLES, and chairs are now provided for tall men and women at a London hotel.

TOKYO HAS MORE THAN one million licensed bicycles within its boundaries.

AN EXPERT HAS been sent to Alaska by the Smithsonian Institution to preserve fine specimens of totem poles from decay.

THE ACTUAL CITY of London covers only 675 acres and contains a population of 13,709. The metropolitan district of London, however, has an area of 443,424 acres and a population of more than 8,000,000.

RANCHES IN BRITISH Columbia plan to fight a grasshopper invasion by the importation of thousands of turkeys.

THE UNITED STATES GOVERNMENT has paid out more than $11,000,000,000 in interest on the public debt since 1771. The greatest amount in one year was $1,055,088,000, paid in 1923. This year the estimated interest payment will be $730,000,000.

THE WORLD'S WOOL crop is only five times what it was a hundred years ago, while cotton production has increased twenty times.

AN AERIAL TORPEDO carrying 1,500 pounds of TNT and traveling at a speed of 200 miles an hour has been developed by the United States Army. Fired from an airplane it can hit a target 20 miles away.

OIL WELLS OWNED BY the University of Texas are producing oil royalties to the state in excess of $10,000 daily.

THE TEMPERATURE OF the moon at its noontime is 250 degrees Fahrenheit.

OF THE 7,000 PRISONERS in Federal penitentiaries, thirty-five per cent are violators of the narcotic law.

BEWHISKERED hotel waiters were first banished in New York in 1893 by the Waldorf.

A PEAT FIRE HAS been burning continuously for 130 years at Wistmans Wood, Dartmoor, England.

THE CHANCES AGAINST the mother quail hatching her eggs are three to one, officials of the United States Biological Survey declare.

THE AMERICAN PEOPLE spend $3,000,000,000 a year, or about six per cent of the national income, for vacations.

A SIX-FOOT UTE Indian for nearly two-score years has worn the garb of a squaw and has been entirely ignored by the fellow men of his tribe because in 1887 he refused to take part in a tribal raid.

THE KING OF GREAT BRITAIN each year receives a herring pie from Yarmouth in payment of that community's feudal obligations.

BRAZIL NEWSPAPERS, when they get out an 'extra,' first let the public know of the event by blowing a strident siren.

NEW YORK POLICE are experimenting with a motorcycle equipped with bullet-proof windshields.

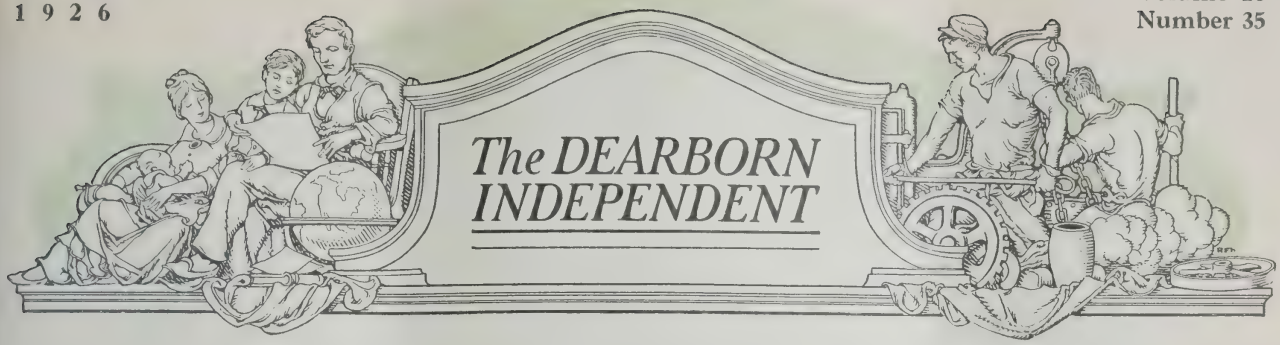
THE GAME OF CHECKERS was played in Egypt in 1600 B. C.

A FRENCH ELECTRICAL concern recently discovered a unique method by which it had been defrauded. A consumer had frozen water in molds to the diameter and weight of a coin and had slipped this bit of ice through the franc-in-the-slot meter. The ice melted after a short time and left no trace.

EXPERIMENTAL TELEPHONE lines between the engines and cabooses of long freight trains have proved effective time-savers in operation of the trains, according to officials of an eastern railway.

MORE THAN $260,000,000 was collected in the United States in 1925 by automotive vehicle fees and fines of various sorts.

SNOW IS CLEANED FROM Salt Lake City streets by water from municipally owned hot springs.



COVENT GARDEN, famous London market place, used since the 17th Century, is soon to disappear to make way for the greatest street improvement ever planned in England.

A COW BELONGING TO Rutgers University gave 21,136 pounds of milk in 305 days, or fourteen times her own weight.

THE ONLY PERSON permitted to appear before the Emperor of Japan with a cane is Admiral Count Togo, who commanded the Japanese Navy on the occasion of its victory over the Russian squadrons in 1905.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week states three cardinal principles which are essential to proper human relations in industry.

---

*Mortgage* is a word of distasteful suggestions. And so a new term—*real estate bond*—has been coined by promoters. 'Bond' has a nice safe sound; none of the distrust of mortgage is attached to it. Clever psychology! (p. 3)

---

But not nearly so clever as the promoter who may try to unload these 'bonds' on *you*. If building costs continue to mount, *if* 'this' does not happen, *if* 'that' continues reasonably sound, *if* there is no change in 'the other,' these 'bonds' *may* prove safe enough. *One thing is sure:* before you invest in any of them, investigate! Start with this article. (p. 3)

---

There is another thing American citizens should investigate—the Philippine question. It is pretty well smothered in propaganda. The Government wanted facts and sent a committee to the islands to get them. Congressman Bacon, of New York, was a member of the committee. He tells here what he found. (p. 6)

---

It seems the Filipinos aren't the only ones with a grievance. There are the Moros. We pledged the Moros a separate government under *our* protection. Then we turned them over to the Filipinos. Now, we don't want any 'scrap of paper' in our history—so it is time to see *how you would vote on the question,* if you were in Congress. (p. 6)

---

The Youth Problem! (Always spelled with capitals.) *'What are our girls coming to?' 'College boys today drink more than ever.'* You are familiar with it all, of course. Well—what do you know about it? Do you know anything about it? Most of those who are doing the talking do not know. The truth is not nearly so bad as the gossip. Not nearly. The youngsters of today are better than the youngsters of last generation. Why shouldn't they be? (p. 5)

---

Many of our readers look forward eagerly to each installment of Finger's *Voyage of the Victoria.* And with good reason. It is a thrilling narrative. Finger has personally followed Magellan's entire route around South America, part of it in a thirty-six-foot yawl. He camped at Magellan's stopping places. No wonder he can make a story interesting! This week he tells of Magellan's inauspicious departure after long delays. (p. 16)

---

'. . . and the British blundered through.' That was a common expression after the strike. Here is *how* they blundered through, told by an American writer who saw it. Maybe it wasn't blundering after all; maybe it was the English spirit of fair play that saw them through. (p. 14)

---

Prehistoric animals felt the lure of Hollywood. The movies, however, did not lure them—it was asphalt. The unfortunate beasts got mired in tricky tar pits and perished. The tar preserved their bones, and they remain today to tell us many things we might not otherwise have known. We know that African lions once roamed California. How did they get there? Was it across an Atlantic continent? (p. 12)

---

Soup-Plate, the British Tommies called her, this last ruler of Burma, immortalized in Kipling's 'Mandalay.' It was a paradoxical name for Supayalat, terror of her country. Few saw 'Theebaw's Queen' after she was deposed by the English forty years ago. One who did was Wayne Gard, newspaperman, who visited her a short time before her death. (p. 2)

---

Ben was a wanderer—liked to visit strange places, see new things. This rated him as a bad boy. But Ben really wasn't bad; he only had the pioneer spirit. Judge Henry Neil presents in this article a different phase of the youth problem, but a phase that is equally important. (p. 8)

---

Sixty-six years ago a rather smallish man bought hides from the farmers around Galena, Illinois. He was, his neighbors thought, somewhat of a failure. A decade later he was President of the United States. In the interim he had commanded the victorious Union forces. In spite of the glory that came in later years, Grant always said the happiest years of his life were while he was a humble clerk at Galena. (p. 18)

---

Then there is a story on wild flower gardens that you will want to read. And the dance article—this week on the proper positions for the feet. And of course you will look for the regular departments, Editorials, Briefly Told, I Read in the Papers, and Office Chats. You will find they contain interesting ideas on many subjects.

---

Next week we have an interview with Robert Frost, American poet. We know Robert Frost and his work. No one can quite tell what he is like. Even Janet Mabie does not paint him as we see him. That indicates his greatness. But you ought to know him, at least through other people's knowledge of him, until you have the good luck to know him for yourself. We will also have an article telling how Brigadier General Dawes was elected Vice-President with an expenditure of only $90.

Supayalat and King Thibaw.

# The Queen of Kipling's Mandalay

By WAYNE GARD

ASHRIVELED, childish old woman—was this the Supayalat of history, the terror of Thibaw's court? I could hardly believe that this was the queen who had ruled Burma from 1878 to 1885. When she occupied the Peacock Throne, I would not by any chance have appeared before her except barefoot and prostrate. But in the secluded retirement of her dotage, little ceremony was required.

Few of her former subjects are living now, and not many of those know where she spent her last years. Yet, until the queen's death in 1925, the royal banner flew gallantly from an obscure house in Rangoon where Supayalat dreamed of the grand days of her youth. It was there that I visited her in 1922, and again in 1923. Ever since I had explored the old palace at Mandalay, I had wanted to see the notorious queen who last ruled there. That quaint teak structure with its gilded thrones is one of the outstanding examples of wooden architecture in the East. Built by Mindon Min, father of Supayalat, it still retains the platforms on the roof where Mindon placed archers to shoot passing birds. No living thing must pass above his head, for was he not king of the universe?

This arrogant pride of King Mindon, inherited with interest by Supayalat, was comically displayed on the occasion of his being shown a map of the world—something he had not seen before.

After having England pointed out, he remarked with satisfaction that he had always known that England was a small country.

Moat, wall and gate of the palace at Mandalay. Circle—Leogryphs near the Palace.

But when he learned that his own kingdom was also comparatively insignificant in area, he became enraged, and was appeased only when the visitor spread both hands across the map to indicate that Burma covered the greater part of Asia.

Mindon Min believed in the old-fashioned big family. He married fifty-three wives, and was survived by something like 300 descendants, including 110 children. The chief worry of his latter days was the choice of a successor. One, previously appointed, had been killed by jealous rivals, and the king dared not name another.

Mindon proposed dividing the kingdom among several sons, but his ministers insisted on keeping it intact. It was at this stage that Sinbyumayin showed her hand. Sinbyumayin, known formerly as the Alenandaw queen, or Queen of the Middle Palace, had been cast aside by Mindon because of her affair with a Buddhist monk.

This woman wanted madly to regain her influence at court. She was without a son, but had three daughters. The second of these, Supayalat, was the sweetheart of Thibaw, one of her many half-brothers. Sinbyumayin's scheme was to have Thibaw made king after Mindon, so that her daughter might become a queen.

# The New 'Real Estate Bond' Industry

## First Mortgages on the Unknown Future Amount to Many Millions

*Second and Concluding Article.*

By AARON HARDY ULM

ILLUSTRATED BY W. W. CLARKE

There are several hundred carrying on such business on varying scales. Most are new concerns, only a few of whom are trust companies or banks subject to the banking laws of State or Federal Government.

WITH its rooms filled and without a moment's cessation of operations, a big, handsome and almost new hotel in an Eastern city was sold recently at auction under foreclosure proceedings. The management had found it impossible to procure from its patronage, though good, enough money to meet operating expenses, taxes and interest on mortgage loans.

The sale at auction was for the purpose of eliminating a large portion of the mortgage indebtedness, which amounted to more money than had been put into the property. This was made possible by operators in a new mortgage industry that has grown tremendously in recent years. Those who suffered on account of the hotel's financing' as achieved by these operators in mortgages were not hard-boiled usurers, of the kind that are pictured in stories or plays built around mortgages. In the main they were small investors who thought they had put their savings into the traditionally safest of all securities. They were purchasers of bonds' issued against mortgages.

The *small investor* now supplies an immense market for the 'real estate bond' type of mortgage. The finest skill of modern advertising and salesmanship is employed in persuading the *small investor* to supply funds in small amounts for loans on mortgages in big amounts. One concern thus procured and 'placed' $150,000,000 last year. It is stated that the average sale by the concern is $1,200 worth of bonds, which means that, provided there was only one sale to each patron, more than a hundred thousand persons intrusted the concern with funds last year.

There are numerous other concerns which handle millions of such funds every year. There are several hundred carrying on such business on varying scales. According to one of the big ones, they were procuring and placing money on city real estate at the rate of $1,600,000 a day in the early spring of this year. This does not include the operations of the old type of mortgage broker, or those of the insurance companies or banks.

Most of these concerns are new ones or newly engaged in the real estate bond type of mortgage business.

They call themselves 'investment bankers.' There is no clear definition of that term. J. P. Morgan & Company is an 'investment banking' firm; so may be the local stocks and bonds and mortgage house around the corner.

The nearest approach to a definition of the term is in the qualifications for membership in the Investment Bankers' Association of America; for example, 'Any national or state bank, trust company, private banker, banking firm or corporation in good standing having a paid in capital of $50,000 or more and which makes a practice of buying bonds or investment stocks and publicly offers them as dealers therein . . . ' In the association are about 700 members, only a comparatively few of whom are trust companies or banks subject to the banking laws of State or Federal Government.

'Investment banking,' even when carried on by a real bank or trust company, does not come under the laws governing banks of deposit and trust companies. The business often partakes much more of merchandising than of true banking.

Many concerns which do an 'investment banking' business are not members of the association, among whose purposes is the promotion of sound practices. Several of the most prominent leaders in the real estate bond branch of the field are not in the association at all. Indeed the association is not so sure of the practices of all its members as to be willing to permit any of them to advertise its membership. The public is thus deprived of what might be a valuable bit of guidance.

The association has given not a little attention to recent developments in the real estate bond field. Its committee on real estate securities has made elaborate reports on the subject at the last four annual conventions. The reports rather stress the newness of this field as now intensively cultivated and indicate wide leeway for bad practice among operators in it.

The field is a virtually new one in spite of the advertised claims of long experience in it put forth by some of the big operators. And time must pass before much of the bad practice can be demonstrated by results. Which means that some losses must inevitably occur.

Such advertising slogans as 'No loss to an investor in a half-century' may be true and yet mean nothing. Take, for illustration, a firm that plays up in all of its nation-wide advertising a claim of that sort. Eight years ago the establishment whose name the 'investment banking' concern now operates under was that of a local real estate firm in an Eastern city. Its mortgage operations were insignificant. *No one connected with the firm then or prior thereto is in its management now.* The long record is that of a name only. Moreover, the record of its present management, about six years old,

The small investor now supplies an immense market for the 'real estate bond' type of mortgage.

Long experience without a loss means nothing unless the management has been the same, that the volume and character of the business done is comparable to what is done now.

shows notorious losses by purchasers of its securities.

'But the losers were not *investors*,' these operators will say if asked to explain. 'They were *speculators*.'

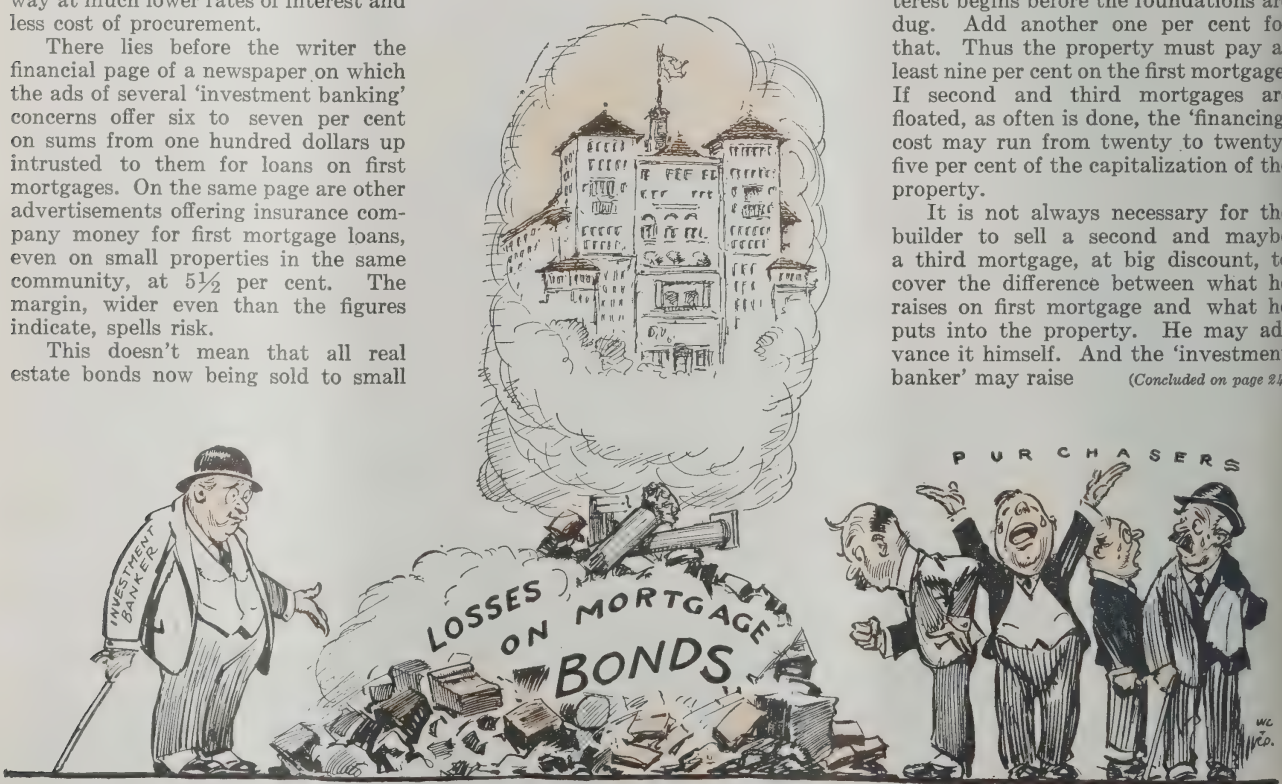
Hence long experience without a loss means nothing unless it is shown that the management has been the same, that the volume and character of business done throughout the period is comparable to what is done now, and that there be no equivocation as to what is meant by 'investor.'

As to this last there is probably not an authority who will say that the purchase of a 6½ to 8 per cent real estate bond on the word of a far-away, unknown 'investment banker' does not partake of speculation. The reason is that mortgage loans, up to the point of assured safety, can be procured for such properties as those that are usually bonded in the 'investment banking' way at much lower rates of interest and less cost of procurement.

There lies before the writer the financial page of a newspaper on which the ads of several 'investment banking' concerns offer six to seven per cent on sums from one hundred dollars up intrusted to them for loans on first mortgages. On the same page are other advertisements offering insurance company money for first mortgage loans, even on small properties in the same community, at 5½ per cent. The margin, wider even than the figures indicate, spells risk.

This doesn't mean that all real estate bonds now being sold to small investors involve ponderable risks of loss. If economic conditions which make the floating of these bonds possible continue uninterrupted, if the level of building costs and rents do not decline materially—that is, if they are not subjected to those strains which are the real tests of securities—the bulk of the bonds whose issuance involves no fraud will prove good. But most of them run for ten years and some for longer periods, and much may happen in that time.

Fraudulent practices no doubt have been engaged in, but so far as known not by the run of operators whose 'national' advertising appears in reputable publications. The leeway for fraud, however, is immense.



Examination of real estate bond advertisements in a popular investment magazine discloses but one wherein the concern sets forth, in terms of capital and surplus, its own financial status.

You generally will find, in small type, at the end of circulars describing specific offerings, declarations like the following: 'We do not guarantee the statements and figures contained herein but they are taken from sources we believe to be reliable.' That is, the concern assumes no responsibility for even its own statements of fact.

These circulars usually describe *properties that are to be* rather than properties in actual existence. A man wants to erect an apartment house, hotel or office building. He procures or gets an option on a site and has a plan for the structure blueprinted. If he can get along with fifty to sixty per cent of the ultimate cost, an insurance company or bank will take a first mortgage on the property at 5 to 5½ per cent interest. But he wants more. So he goes to an 'investment banker,' who agrees to get it for him. The 'banker' goes through the form of buying a six to eight per cent mortgage on the property that is to be. He pays six to fifteen per cent, less than the face value of the mortgage which he sells, in the form of bonds, for full face value. As the bonds are sold the money is turned over to the builder.

Take, for example, a seven per cent loan on an average property. It quite probably represents seventy per cent or more of the value of the property as appraised from plans. The 'investment bankers' margin adds another one per cent to the interest rate. The loan runs for some time before there is any income from the property. Interest begins before the foundations are dug. Add another one per cent for that. Thus the property must pay at least nine per cent on the first mortgage. If second and third mortgages are floated, as often is done, the 'financing' cost may run from twenty to twenty-five per cent of the capitalization of the property.

It is not always necessary for the builder to sell a second and maybe a third mortgage, at big discount, to cover the difference between what he raises on first mortgage and what he puts into the property. He may advance it himself. And the 'investment banker' may raise (Concluded on page 24)

The advertised claims of some operators may be true and yet mean nothing.

# A Good Look at Our Young People

## Analysis Discloses That the Newer Generation Is Not Deteriorating

By STANLEY HIGH

I LISTENED in, the other day, while three fellow passengers on a Pullman car discussed the younger generation. A novel, part of the flood of unsavory fiction that has inundated us with attempted descriptions of American youth, had prompted the discussion.

'Everything,' so the gossip ran, 'is wrong that could possibly be wrong with our young people. Frivolity is on the increase, moral ideals at a low ebb, the college campus a center of leisurely dissipation and the home robbed of its ancient authority.'

There were frequent returns to the novel, with liberal extracts to substantiate these conclusions. Stories of the hip-pocket flask were freely featured and to cap the climax the Volstead Act was dragged in and held responsible for the 'fact' that America's present younger generation had gone off on an uninterrupted prohibition-stimulated debauch.

I did not join in this conversation. My fellow travelers, apparently, were chiefly anxious to confirm their own convictions, a fact that they made clear by frequent, if surreptitious, use of a bottle tucked away in a carefully guarded handbag.

For another reason I did not enter the discussion. It smacked too obviously of propaganda. Distorted pictures of the youth of this generation have become the stock in trade of those who are much less concerned about the welfare of young people than the legalizing of their own habits. So-called arguments of that sort do not lend themselves easily to refutation.

This propaganda, however, is not serious because of the propagandists. It is serious because, for lack of better information, law-abiding men and women become the agents for the propagandists by passing on their assumptions. The story of the dissipation of one youth obtains ready circulation. The story of the serious-minded, law-abiding majority is seldom told.

There is one fact that needs to stand at the beginning of any attempt to understand and rightly appreciate the young people of today. It is that this is not the first period that has had to face what appeared to be the baffling problem of its younger generation. Youth, in every age, has been a source of considerable adult perplexity. Many of the much-talked-about vices of 1926 might appear much less vicious if we could recall a little more accurately the youth problem of the past.

About the year 1700 there lived in Boston, Massachusetts, a minister, Samuel Sewall. Samuel Sewall, rightly concerned about the welfare of the young people of his parish, records in his diary an incident that reflects the humiliation with which the elders of his day viewed the insubordination of the younger generation. In this instance the wrongdoing was revealed in a tendency among the young men to cut off their hair and disport themselves in wigs. On June 10, 1701, the Reverend Mr. Sewall writes:

'Having heard last night that Josiah Willard had cut off his hair and put on a wig, I went to his house this morning. Told his mother what I had come about and called Josiah. I inquired of him what extremity had forced him to put off his own hair and put on a wig. He answered: None at all. Then said his own hair was straight and parted behind. Argued that men might as well shave their hair off their heads as off their faces. I told Josiah wigs had been condemned by a meeting of ministers in Northampton and prayed him to read the Tenth Chapter of the Third Book of Calvin's Institutions. Josiah's father told me that if he had known about it, he would have forbidden Josiah to cut off his hair. Josiah's mother said she had heard him talk of it, but was afraid positively to forbid him, lest he should cut his hair and so be more faulty. God seems to have ordained our hair as a kind of test to see whether we will be content at His finding, or whether we will be our own carvers, and come no more at Him.'

A very little re- (*Continued on page 21*)

# Why Not Keep Faith

## Justice Is Due to These People as Well

By ROBERT L. BACON

THAT a separate government should be restored to the Moro provinces of the Philippines became apparent to me when, as a member of the Committee on Insular Affairs, I spent last summer seeking some solution for the problem of the islands, which is constantly coming up in Congress. This view of the situation has been strengthened by studying the history of the Philippines, and through conferences with those who have been interested in the welfare of the islands since they passed under American control.

Three reasons for this solution are:

1. Economic conditions of the Moro provinces.

2. Peace of the islands.

3. Our treaty with the Moros, when we promised them a separate government on condition that they would recognize the sovereignty of the United States.

Being impressed evidently with the importance of adopting some constructive and permanent policy in dealing with the Philippines, President Coolidge has appointed Carmi A. Thompson, of Ohio, as his special representative, and has authorized him to make an investigation of conditions in the islands. This is not the first time such an investigation has been ordered. In 1921, President Harding named a similar commission, consisting of Major-General Leonard Wood, now Governor-General, and W. Cameron Forbes, a former Governor-General. In 1910, John M. Dickinson, then Secretary of War, was named by President Taft as his special commissioner and made a report. Various other commissions of the President and Congress have surveyed the Philippines.

Two 'datos,' or chiefs, of Cotobato, Island of Mindanao.

The Thompson Commission may have some recommendation as to the government of the islands, but our duty to the Moro provinces appears to me to be so plain that it requires no special investigation. Even if it should eventually be decided that the rest of the islands should be given independence, the Moro provinces must be given a separate government if we courageously meet the situation there and carry out our agreements with the Moro people.

We have no apologies to make for the early policy of the United States in dealing with this great archipelago that came to us through the Spanish-American War. The Philippine Islands comprise a territory approximately equal to New England, New York, and New Jersey. Their population is now about 12,000,000, as compared with 21,000,000 in these states. A Malay people, for nearly four centuries they were tyrannized over and kept in ignorance by Spain.

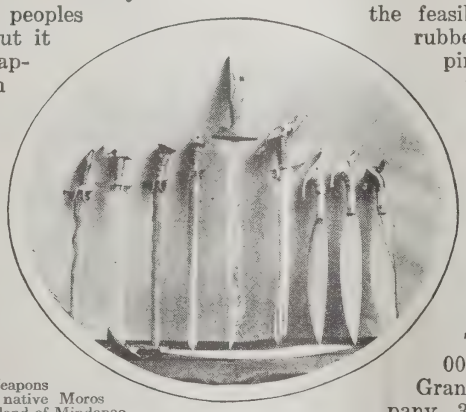
A revolution against Spanish authority in 1896, largely limited to the Island of Luzon, had quieted down before Dewey won the battle of Manila Bay. In the treaty of Paris we paid off $20,000,000 of Philippine obligations. In establishing a stable government we spent about $170,000,000 more. We have reduced illiteracy from almost one hundred per cent to about forty per cent, compared with illiteracy in India today of ninety-three per cent after one hundred and sixty years of British rule. We wiped out smallpox and cholera. We governed the Philippines for the Filipinos.

At first we established a military government. Then we gave them a commission. Then we extended their autonomy by granting an elective assembly, or lower house, with the commission as a senate. We gave them an elective assembly and a senate as well, with power in the latter to confirm appointments made by our own Governor-General. This gave them a preponderance of power while we were left with complete responsibility.

Promptly the new form of government reduced the number of American officials and employes to a cipher, founded a Philippine National Bank and wasted its funds by various government-ownership ventures. It became necessary to borrow $38,000,000 to reëstablish the country's currency, of which about $3,000,000 was expended in defraying the cost of a propaganda campaign in the United States to convince us that they ought by

ow used by the Filipino Constabulary, the presence of which is much resented by the Moros.

# With the Moro Race?



## s to the Other Natives of Philippines

CONGRESSMAN
FROM NEW YORK.

ght to have entire independence.

We have really two problems to olve. That of the Moro provinces ould not be involved with the future f the rest of the islands. How vital ese provinces are to ourselves, as ell as to the Moros, may be gathered om an examination of their potential ealth. They have what we need. heir people have not the capital to evelop them. Nor have they the conomic market for them. They esire the happiness of a well-governed erritory. We desire to give it to them. ut we also wish to develop a region hich would add to material civiliza- on, and therefore to other instrumen- alities of the modern world.

We can, if we will, carry out more erfectly the policy advocated twenty years ago by 'Uncle Jimmy' Wilson, then Secretary of Agriculture, that the United States produce within its domain all the things necessary for its sustenance. This would not exactly apply to the 500,000,000 tons of iron and immense reserves of coal in the Moro provinces, which form the basis of a future great steel industry for supplying the peoples of the Pacific; but it would perfectly apply to the growth of rubber, coffee, quinine, sisal, and copra, which we need, and for which we have been subjected to extortionate prices merely because we have not grown them and thereby broken the market.

Oval—Weapons used by native Moros on the Island of Mindanao.

*All photos by Philippine Bureau of Science, Manila.*

Below—Philippine family with a carabao cart.

In the islands of Mindanao and Basilan, within the Moro provinces, are 1,500,000 acres or more of the best land in the world for the growth of the finest Para rubber. Climatic conditions are perfect. The percentage of rainfall is adequate and properly distributed. Destructive winds, inimical to Para rubber, do not blow there. The mean annual temperature remains about eighty degrees. Nowhere does it fall below sixty degrees. While the great rubber-producing areas of the world are immediately adjacent in the Dutch and British East Indies, the feasibility of growing rubber in the Philippines was not realized until comparatively recently.

Today the American Rubber Company has 1,625 acres and 175,000 trees under cultivation. The Basilan rubber plantation has 759 acres and 89,000 trees, the Rio Grande Rubber Company, 360 acres and 29,750 trees, and the Zamboanga Development Company has 110 acres and 10,000 trees, out of a total available area of 1,500,000 acres and something like 225,000,000 trees.

The possibilities may best be seen by a comparison of average acreage of the Basilan properties and that of the Sumatra East Coast, the best rubber produced in the world. On the Basilan property in the tenth year the average growth of a tree is thirty-nine inches, as compared to thirty-nine inches in Sumatra. On the Basilan property the average bark thickness is 8.1 inches and in Sumatra it is 8.2 inches. Labor is plentiful and cheap. The wages average from forty to fifty

(Concluded on page 31)

# What Has Become of Ben?

## The Story of a Boy Whose Restless Gypsy Blood Made Him an Aimless Wanderer

By JUDGE HENRY NEIL

ILLUSTRATED By W. W. CLARKE

I OFTEN wonder what *has* become of Ben? As I sit before the fire on this winter evening, I see flickering in the embers the faces of many misfit youngsters whose problem once I shared. All of those boys came into the world a winsome mite of humanity. For each some mother dreamed tender dreams and foresaw a happy future. Yet in each case the rosy promise of babyhood gave way to a hardened, rebellious youth. All of them had trouble with their parents, with their teachers, with their neighbors—with the police. Each became a 'bad' boy.

Among these firelight faces—in this youthful rogues gallery of my remembrance—Ben holds a place apart. For I have roughed it across the continent with him, told him tales of travel as we camped out under the stars, and seen his face grow bright as he in turn spun me yarns of his own wanderings.

Where has that restless gypsy blood of his taken him now? Doubtless on this chilly evening he is curling up under a ragged coat in some tenement hallway, and dropping off to more peaceful slumber than I, for one, will ever share again.

When I think of Ben, I think of two immortal boys of fiction. These were Kipling's Mowgli, who dreaded roofs and walls as did his friends, the jungle beasts, and Huck Finn, who hated a house and a bed as much as he did good clothes and school.

As I entered the courtroom on the day of my first meeting with Ben, the chief probation officer drew me aside.

'What shall we do with this kid?' he asked. 'He is only twelve years old, but he's in high school, and has been getting good marks. It's past me how he ever got that far, for he never stays long in any one school. The policeman who brought him in this time found him sleeping by a fire in a vacant lot in Ravenswood. He had wrapped this book up in his coat, for a pillow.'

The book, I remember, was called *Tales of the Indian Country*.

'Welfare workers,' said the probation officer, 'have tried every known scheme of boy salvation on Ben. Ben has submitted to each experiment, and then gone off quietly, by himself, leaving the welfare workers to patch together the shreds of their scheme and try it on some other boy. He's a lovable little lad, and bright as they make 'em, but he just won't stay put.'

Ben seemed to me worth getting acquainted with. I found him a slender, dark-haired youngster, with honest brown eyes, and a quick, frank smile.

'Ben,' I said to him, 'we are all of us your friends. We want to help you. But first of all we must insist that you have some regular home. And we want you to stay there. You can't go on this way, you know, sleeping in vacant lots or railroad sheds.'

Ben looked me in the eye with courteous attention. It was as though he was trying to understand some foreign language. He heard my words, but they just didn't seem to him to make sense. I could see that he didn't know whom I meant by this vague 'we' that I mentioned, nor what right 'we' had to dictate to him. And why we weren't going to let him go to sleep when he felt sleepy, wherever he happened to be at the time, was quite beyond his comprehension.

So I tried another tack.

'You select your own home,' I said. 'Just make up your mind where you want to live, and then *stay* there. There are plenty of private families that will take you in, or there are institutions where you can live almost as if you were in a fine hotel. You take your own choice. The state will pay your expenses. You can keep on going to school.'

Ben, bright as he was in classwork, stared at me almost dully. He said nothing. A little later that morning, when his case was called, I learned why my talk about 'home' and 'happy families' didn't suggest any intelligible ideas to him.

The evidence at Ben's trial showed that his mother had (Concluded on page 28)

One afternoon Ben set out in what he conceived was the direction of the Indian country.

# MR. FORD'S PAGE

THERE are three cardinal points at the labor end of the productive system, none of which can be disregarded without ensuing dissatisfaction. By this is meant not the dissatisfaction of the workman, but that of the engineer-manager who knows that nothing works right that is not rightly constructed. Our system of production must be put together with as careful reference to all its parts as the most particular machine.

The first point is that hard work, in the old physical sense, is out of date. The laborious bearing of burdens, the fist used as a hammer and the arm as a lever, did not accomplish much. And what was accomplished thereby did not spring out of free labor. In these days of wider work a man is regarded as better than a beast of burden, his human qualities are more highly valued; it is his character, his brain, not merely his brawn, that fits him to his part in the present system. That is a badly managed shop where men do what can be done by machines. The machine places the man in the position of mastery, which hard hand labor never does. When the achievements of modern industrial science are summed up, high place must be given to its ceaseless effort to lift the burdens off flesh and blood and place them on steel. Hard work is not productive; hard work does not pay; an industry founded on hard work and doing nothing to eliminate hard work is not and cannot be prosperous. Hard work means quite a different thing than we have thought it meant.

*HARD work, a too large labor force, and low wages, have no place in successful industry. Hard work, the laborious physical exertion men once had to put forth, accomplished very little. Reducing the number of men per operation reduces the cost to the consumer, and this increases the demand for the goods, and this in turn increases employment. When a seven-man job is made a one-man job by machinery, six men are not thereby thrown out of employment; practical experience shows that it makes jobs for twice or thrice the number of men originally employed. Low wages shows poor management, poor finance, poor production.*

The second point is this: the effect of labor-saving devices is not to diminish the number of men employed but to increase it. If the point just above may be referred to employers, this second point may be referred to employes. There is a jealousy among uninstructed men of the new efficiency methods being adopted. Maybe some of the so-called efficiency methods are not efficient at all, and should therefore be objected to. But taking the main trend of progress in this respect, there is still suspicion and jealousy of all improvements which cut down the labor cost of various operations by reducing the number of men required. It is just as foolish to use the labor of seven men on a piece of work which could just as well be done by one man, as it is to keep six men carrying bricks from one point to another and then carrying them back again merely to give them employment. One would think that the workingman himself would resent being kept on work that meant nothing but employment.

However, most of the conclusions of those who would 'defend' the workingman from the 'encroachment of the machine' are drawn from thin air; they are not the conclusions based on experience. The experience of the Ford Motor Company would probably be admitted as competent in this matter. In few places has labor-saving policy been so insistently pushed—both as regards reducing the labor which men have to perform and reducing the number of men required to perform it—and the result is that where a seven-man job has been made into a one-man job, by the introduction of machinery, it has never meant that the extra six men were thrown out of employment; it has rather meant that twice the number of men were put to work. And the reason is that where you reduce the cost of your goods, you increase the number of your customers, and this means an increased production which requires an increased force of employes. It is a rather notable fact that a company which has gone on for twenty years reducing the number of men per operation, has gone on for twenty years steadily increasing the number of men employed. Saving the waste creates employment instead of diminishing it. On the other hand, it is perfectly obvious that a concern which takes the course of increasing the number of men per operation would soon have no employment to give at all. Its goods would be too expensive to buy, too clumsily made to use; it would die. That is not the way to provide employment.

Another cardinal point is this: no business worthy the name should be financed out of the pay envelopes of its employes. A manufacturing institution that does not make a good wage for its workmen along with the commodity it makes for the public is not a good manufacturing institution. Wages—good wages—is one of the products of a good business. It is one of the curious paradoxes of business life that the manufacturing concern which tries to give the lowest wages tries also to get the highest price out of the public for its commodity, whereas the concern which pays the highest wages will be found to be giving the public the highest value for its money. The advantage of a right method is that it is right all round, and one thing done right leads on to another, and that to another, until the circle of benefit is complete.

## *Borah to the Lead*

IT IS not by accident that Senator Borah becomes leader of the 'dry' campaign in the Senate. He is from the West. A man from the West knows more of the United States than a man from the East. The man in the West is compelled to look over a greater stretch of country to see the United States than is the man from the East, who often is blissfully ignorant that there is a United States. That also explains the excessive 'wet' propaganda in the newspapers; all the wire services are located in New York, and the public opinion thereabout is alien, and it is only a matter of time before the New York state of mind takes preëminence over any other.

But the country is 'dry' in conviction and practice, and Senator Borah has the advantage of knowing that fact. Bryan knew it too, for no public man of our generation was ever so constantly in contact with so many plain people as was Bryan. Borah's position will carry through, because it is the popular position. It may make trouble for the regular Republican party, and if so, the country will be just that much better off. A little honesty on the prohibition question wouldn't hurt the Republican party. Borah probably knows that too.

## *The Unitarian Women*

THE Unitarian women of the United States are to be congratulated upon the triumphant issue of their protest against the abandonment of the word 'Christian' in the title of their organization. The Alliance of Unitarian Women, meeting at Boston, desired to make their society inclusive of liberal religious women everywhere, and so it was proposed to rechristen the society 'The General Alliance of Unitarian and Other Liberal Christian Women.' This was amended by a proposal to strike out the word 'Christian.' The supporters of this proposal argued that Jewish women would like to enter the society but did not like to be stamped as Unitarian or Christian. The discussion which ensued was without acrimony, but it indicated an essential soundness of mind among the women which is very refreshing in these days of hectic interracial and international propaganda. Mrs. Ulysses G. Pierce, wife of the former chaplain of the United States Senate, suggested that this was no time to seem to step out of the ranks of Christian women. Another woman arose and said that it was well to appreciate the good that can be found in Buddha, Mohammed and Confucius, but that it remained for Christians to render Buddhistic and Mohammedan and Confucian countries fit to live in. And so the name of 'Christian' remained in the new title of the association.

This is a rather striking event, occurring as it does among women whose liberalism would naturally lead them away from anything suggestive of exclusiveness. There has been too much reckless abandonment of traditional inheritance at the behest of those who have no inheritance to preserve. The false sort of liberalism has been exalted, which is indistinguishable from spinelessness. It is heartening, therefore, to find women on the frontier of the Christian position definitely proclaiming that the frontier exists and is worth maintaining. Christianity is not exclusive in any sense, but it is a distinct entity, having a name and a life, both of which are too big for betrayal by that sinister cast of mind which cloaks its lack of conviction under the false label of liberalism.

## *Out of the World*

HOW important is news? Commander Byrd arrived at Gravesend the last of May. He heard the people of England talking about the strike. 'What strike?' he asked. 'The great general strike,' they replied; 'haven't you heard of it?' 'No,' said Byrd, 'is it over?' It was. He had been in the Arctic navigating the Polar regions by airplane, casually sailing above the silent seas of the ultimate North, while men on land that lay away from him in every direction were stewing in 'news.' Off one direction, Russia. Off another, England. Off another, America. Off another, China. All manufacturing news, and Byrd knew nothing about it. A man came back from his camping trip and found that one President had died and another been sworn in. A man picked up a month-old newspaper and read it through before looking at the date; it seemed unimportant that he did not have the 'last edition'—the news was all the same. What difference does it make if we miss a day or two?—yesterday's accidents and crimes were the same as today's—tomorrow there will be no variety. Missing a day of it isn't missing much. And yet, the news habit is like a drug habit; its addicts must have it.

## *Which Way Is Coolidge Going?*

SOME newspapers thought they heard a note of impatience in President Coolidge's address at Arlington. A reading of the document does not compel that observation. However, a note of impatience would be perfectly natural. Here is the United States Government at the head of the procession of world disarmament, throwing its accouterments to the winds, burying its navy underseas, marching on, as it thinks, at the head of a disarmed world, and then suddenly looking round to find that no one is following. We constitute the whole procession. The President might well call the nations of Europe to account in plainer words than have been used since President Wilson; but will it alter the case?

There is a suggestion of discrepancy between President Coolidge's assumption that we lead in disarmament and his declaration that the United States never had a finer defense establishment in peace time than we now have. One or the other is more or less true. There can be no doubt that we have gone the limit in disarmament. If the people of the United States realized what was done to our sea force under the disarmament agreement, there would be authoritative public protest throughout the country. And admittedly our land forces exist only on paper. How, in view of this state of affairs, President Coolidge can say that we have a finer defense establishment than we have ever had before in peace time is not quite clear. The President may have occult knowledge of the fact, but we have never been able to get the same opinion from any responsible army or navy man. And it would be entirely improper to suggest that the President used his Memorial Day address to answer charges which are growing somewhat formidable in the country. Military and naval men being totally muzzled now, no controversy with the Presidential statement is likely to ensue.

In stating the temper and attitude of the people of the United States, the President puts the case with great fitness and truth. His analysis of force is now accepted by all civilized minds. His counsel to Europe has the high quality of being disinterested and wise. He somewhat soft pedals the claims formerly made for the World Court, and he distinctly says that it is Europe which has the League of Nations. But clearly Presidential impartiality is giving way to the pressure of politics. The President is conscious of a colder wind blowing in from the country, which he must turn away, or change in temperature, if either be possible. There is just the danger that the cold wind may be interpreted as hostility and be met with hostility, or, what is worse, politics.

*But the feeling toward Mr. Coolidge is not one of hostility, although it does contain an element of disappointment.* This may seem like ingratitude in the face of decreased taxes and the like, but it is not that; it is merely another phase of the truth that man does not live by bread alone. Reduced taxes make an agreeable incident, they testify to efficient routine in administration, but they do not satisfy the hunger for that leadership for which our people look to their President.

Mr. Coolidge, to put it plainly, is appearing before the country in a more and more corporation light. The people feel that the advice which he is receiving is wrong. Mr. Coolidge has gone to the worst examples of the old type of business mind for his guidance, and it has not been good guidance; it has not even had the saving grace of being loyal to the man it was guiding.

Nothing is harder for a President than to shake himself free of advisers whom he has called to himself, but there are times when such action is his duty. The plain people of the United States feel that they have small part in the Coolidge government. Even the remedial legislation, which Mr. Coolidge supports because he has been told that it will benefit plain people, is corporation legislation mislabeled. It is rather a hard thing to say that a President is in danger of becoming thus ensnared, but there may be more loyalty in saying it than in keeping silence while the ruin silently works.

The Coolidge Administration is worth saving to the country; especially is Coolidge himself worth saving. But there must be a scattering of the crowd around him if this is done—and Mr. Coolidge hasn't shown himself much of a scatterer.

---

## *A Valuable Aid*

THE discovery at the University of Wisconsin of a new local anesthetic whose effects are said to last two and one-half times those of the usual anesthetic, and which has only one-tenth the poisonous quality of cocaine, will create interest in these days when pain is an outlaw. It marks another movement in man's war against suffering. The earliest form of anesthetic was pressure exerted on the carotid arteries of the neck. The ancients used opium, *Cannabis indica*—our modern hashish—and alcohol to stupefy the patient.

Early in the 19th Century the discovery of a general anesthetic was made by American physicians, which opened the way for the art of local anesthesia by the use of cocaine and its derivatives. In giving man a blessed oblivion of suffering at supreme physical crises, wider fields have been opened for curative surgery.

# African Lions Roamed in Hollywood

## Discoveries That Indicate Prehistoric Game Trail Once Extended From Old World to New

By SAMUEL HUBBARD

CLOSE to the city limits of Hollywood there was enacted a prehistoric tragedy which took place in what has been aptly termed 'The Death Trap of the Ages.' Just exactly what occurred here is a matter of conjecture. I went carefully over the ground with the man who superintended the excavation and restored the skeletons of the various animals which are now on exhibition in the Los Angeles Museum, and this is my own version of what happened.

The stately Wilshire Boulevard, from Los Angeles to the sea, follows a flat shallow valley, connecting the hills back of Hollywood with the ocean at Santa Monica. Today this region is dotted with the homes of happy people, enjoying all the advantages of our 20th Century civilization. Unknown thousands of years ago, this valley and the adjacent plains were the winter range of vast herds of wild game.

Bands of enormous elephants wandered through the lush grass of the valley, or climbed among the desert cedars on the foothills. The Imperial Elephant of California (*elephas imperator*) was the largest elephant found anywhere in the world. They were from fourteen to sixteen feet high at the shoulder. Jumbo, the largest elephant of modern times, was eleven feet two inches.

Herds of primeval cattle dotted the plains. These were six feet high, and had a hump on the fore shoulder, similar to our American bison. Great bands of camels and wild horses came in from the plains, and wandered up the sandy river beds in search of water. The greater and lesser ground sloths, covered with a protective armor of horny plates, dug up roots with their powerful claws.

Preying on these grass-eaters there was a noble array of Carnivora. King of them all was an enormous lion. I do not mean the little insignificant California lion, or cougar, but a huge beast exactly like the African lion of today, only so much larger that a full-grown male lion from Africa looks like a cub beside his California cousin.

Then there was a great cave bear which was a worthy antagonist of the lion. Judging from the size of his skull and other bones, it is estimated that when this bear was standing on his hind legs he was all of twenty feet high.

Sketch map of locations of various discoveries in the Hava Supai Canyon in Northern Arizona. Reported to be 'a veritable mine of archeological treasures.'

The saber-toothed tiger was probably the most abundant of all the big Carnivora. This great cat was more like a huge lynx, rather than like the Bengal tiger of today. He was high on the shoulders, with a sloping back and a rather short tail. His curved, saber-like teeth hung below the lips a good six inches or more. Then there were packs of formidable wolves of great size, which undoubtedly hung on the flanks of the cattle herds and the camels.

Hovering over these bands of slayers great vultures awaited their turn at the feast. The California condor was there with his wing spread of eight feet, and scientists have assured us that the South American condor and the California condor had reached the extreme limit of birds of flight; that a bird with a greater wing spread could not rise from the ground.

The Indians have a tradition concerning a huge bird which they call the 'Thunder Bird,' and there is a pictograph on a cliff in New Mexico intended to represent this bird. The pictograph is said to be ten feet wide. The Mongols also have a symbol referring to this bird, which means 'a bird that is taller than a man on horseback.'

This story about the 'Thunder Bird' was supposed to spring from the imagination of a race of people who dealt in 'Fairy Tales.' But for once the scien-

tists were wrong. I have seen the skull, the breastbone and the wing bones of a vulture so huge that it had a wing spread of *sixteen feet.* This was in all probability the 'Thunder Bird' of the Indians, and their tradition was based on fact. The foregoing statements may sound like the *Adventures of Alice in Wonderland,* but any one can verify them by a visit to the Los Angeles Museum.

The upper part of this valley, before it was subdivided into city lots, was known as the 'Rancho la Brea.' 'Brea' is a Spanish word meaning bitumen or asphaltum. The crude oil of California has an asphaltum base, and the fact that this old Spanish rancho was over an oil pool is proved by the small forest of derricks, which even to this day support the pumps which are extracting the oil.

In early days, before the wells were put down, the enormous gas pressure forced the oil to the surface through crevices and fissures in the ground. The volatile parts, such as the gasoline, benzine, and kerosene, evaporated in the heat of the sun and left behind the asphaltum in the form of a sticky black tar. This soon mixed with sand, dust, leaves, sticks and other foreign matter, and solidified into bitumen or natural asphaltum.

When the city of Los Angeles began to take on metropolitan airs, a demand was created for better streets and sidewalks, so this handy natural deposit was mined and carted away for that purpose. Even then it was found to be full of bones, but they were thought to be the bones of domestic cattle, horses and mules, until one day a scientist happened to pick up the curved tusk of a saber-toothed tiger. Then it was realized that this was a veritable mine, filled with the bones and skeletons of prehistoric animals.

The Los Angeles Museum sent a corps of workers to the spot, and they dug up and assembled the skeletons of all the animals just enumerated and many others as well. The result is that there are now more tons of prehistoric material stored in the basement of the Los Angeles Museum than in all the museums of the world combined.

If we could turn back the pages in the 'Book of Time' until we came to the chapter headed 'Miocene,' when these great animals flourished, I believe we would see an amazing spectacle.

Imagine, if you please, that a bolt of lightning has started a grass fire in the hills. It increases to a conflagration when it strikes the long dry grass in the valley. The frightened herds of game fly in terror before it. It finally reaches the place where these great fissures are belching their inflammable gas into the air. With a roar that can be heard for miles this gas ignites, and terrifying red flames leap hundreds of feet high.

The grass fire passes on, but zigzagging across the floor of the valley there is a blazing inferno. The burning gas after a while ignites the bitumen deposit, and this burns all summer until there are deep pits in the ground. The winter rains come, or a cloudburst in the hills sends a wall of water down the valley. This puts out the gas fires, and fills up the pits with water. The gas continues to bubble up through the water, and each time a bubble bursts on the surface of the pool, it releases a molecule of asphaltum, which sinks to the bottom of the pool, in a sticky black mass.

It has now come to pass that an innocent looking pool of water is in reality a deadly trap. The fire has undermined the sides, and the water covers a deposit of black viscous tar, which acts as a death warrant to any animal unfortunate enough to get mired in it.

You have all seen flies get tangled up on fly paper? Imagine something of the same thing happening to elephants, and you may get a faint idea of the frightful tragedies which took place again and again in these dreadful pits.

The water holes in the nearby river bed have dried up, so a band of elephants is attracted to one of these quiet pools. The thirsty ones behind crowd the leaders into the water. They quench their thirst and attempt to get back on the bank only to find one or two of their number stuck fast in the treacherous tar. Their trumpetings of distress attract a saber-toothed tiger, who waits his chance until the elephant is helpless before beginning his horrid meal. A band of the large wolves of that day, lured by the smell of fresh meat, appear on the bank of the pool and begin to bay the tiger. In retreating from their attack the tiger himself becomes engulfed. In the general fight which follows, some of the wolves are caught in the treacherous slime.

Perched on the nearby trees are the silent witnesses to this scene. As soon as the 'belly-need' of the Carnivora is satisfied, condors, carrion crows, buzzards and the huge vultures circle down to the feast. In the gorging, crowding and confusion of famishing birds, an incautious wing tip touches the tar, and it is soon all over with the bird.

And so it went on, year after year, and century after century. No man knows how long ago it occurred, nor how long it lasted. The flesh was macerated from the bones, and they in turn were soaked full of the tar, which acted as a preservative. Those which came after trampled the skeletons of the earlier victims deeper and deeper into the quagmire, until they were locked together in endless confusion. To

# Why the Great Strike Failed

## American Gives Vivid Pictures of English Level-Headedness When Millions of Workers Downed Tools

By HENRY ALBERT PHILLIPS

*Photos, Keystone.*

The last great labor mass meeting held in London before the General Strike was called.

FROM an American viewpoint; from the French viewpoint too for that matter—because she refuses to get excited over things that not only deeply concern us, but herself as well—England is the most exasperating country in the world. Nothing quite incites the average American to the point of butting in and taking charge of the situation as the spectacle of either an individual or a nation allowing itself to be villified without bellowing or hitting back even before the situation is made clear or further beclouded. We say of such a nation that she is either a coward or a stupid.

At the height of the Irish Rising, I remember often stopping in Trafalgar Square to listen to a series of rabid Irishmen get up at the foot of the Column and curse and damn England. Meanwhile a good part of London swarmed past in motors, on busses and on foot. Some paused to take their pipes out of their mouths and look in the direction of the agitators with the slightest crinkle in the corner of the eye. A couple of Bobbies stood looking on rather than listening with their hands behind their backs. Around the forum were gathered perhaps a hundred wildly excited Celts and Trades Unionists.

Then again, only a week before the Great Strike was called, no less than a dozen agitators stood on soap boxes, each with a red flag flapping before their rostrums, cursing and damning the British Government. There were great crowds—there always are of a Sunday evening—'Arries and their 'Arriettes, soldiers from all the London regiments with their 'tarts' on their arms and lingering East End families who had bussed over from Aldwych 'to 'ave a luke at the bloomin' toffs.' But that was all. If anything, the religious revivalists were attracting the bulk of the crowds.

Again, at the Football Cup Final, when Parliament was in the midst of its vitriolic battle and all hope for a settlement of the sinister Question had come to an end, I saw representative England together en masse. It was the greatest game ever played in England, they told me. There were more than 130,000 people come to see it. They came from all over England in charabancs, trains and motors; the rich and otherwise, Trades Unionists and White Collars, rabid Reds and cold Conservatives. But you see, it was Sport!

HERE is an entertaining story of how the strike appeared while it was on.

Incidentally, it is also a true and diverting discussion of how England faces her troubles.

When it comes to Sport in England class lines vanish and rancor melts in a common fluid spirit. If it comes to Civil War, I am sure that an armistice could be declared at almost any moment if a series of matches could be arranged between the pick of the Crown and the Red battalions. There actually was one between a team of policemen and one of strikers.

Then, almost on the eve of the calamitous call, I made one of a party of ten gentlemen and ladies bent on making a gay evening of it. I could not help thinking of Thackeray's depiction, in *Vanity Fair*, of the Duchess of Richmond's (I think it was) Ball on the eve of Waterloo. The Englishman nonchalantly finishes whatever pleasure he has in hand first and then turns and faces the more sinister situation grimly, just as Sir Francis Drake finished his game of bowls before defeating the Spanish Armada. These were all serious-minded men of affairs, each with inevitable losses involved in the inevitable issue.

One of the party was the editor of the Sunday edition of one of London's greatest dailies. We had gone from Rule's Bar—sitting in the famous corner where the Prince of Wales of another day used to sit with the Jersey Lily—to the Cosmo Club, which for jazz inconsequentialness and midnight hell-raising staggers quite abreast with any of New York's Night Clubs. The editor looked round at the madly dancing, singing, cavorting throng wearing grotesque paper caps and simpering smiles, remarking drily: 'Won't all this kind of thing look damn silly if a General Strike is called tomorrow!'

The General Strike was called 'tomorrow.'

But all that possibly can or could happen in consequence is subservient to the spirit rather than the mechanics of the situation. It is the same spirit that has carried England blunderingly through so many crises. The English are not so stupid as they are stolid and stubborn and deliberate. They refuse to get excited.

* * *

Add Chicago to New York and you will have a city a little larger than London. Now, on the stroke of a given midnight stop all her subways and surface cars, her elevated and bus lines,

her ferries and passenger boats. Extend this blockade to the suburbs, and stop all suburban busses, trains and trolleys. Then imagine every wheel of rolling stock in all America stopped. This means not only for passengers but also for the shipping of merchandise and the mails. You may think you will have the excitement of reading about it, but you won't. The presses of England have been stopped dead.

So, on the morning of Tuesday, May fourth, England woke to find transportation and communication at a standstill. The milk might have been at the door, but there was no morning *Times* or other newspaper, no mail, no bread and no bus passing the door. No one could tell you about what was going on; no one knew. If you wanted to get anywhere—unless you owned a motor car (the motor car for transportation and the radio for communication almost landed a knock-out to the effectiveness of the General Strike in the first twenty-four hours)—you had to walk.

I joined the procession at Hampstead, which, though it is a part of London (N. W.), yet is many miles from the teeming center. There was a steady stream of pedestrians and vehicles all the way in.

It was not until one reached Oxford Street, however, that one got the full-fledged effect of the Great Strike. Oxford Street is the great artery leading from the throbbing heart of the metropolis westward toward its extremities. On it are located many of the great shops of which Selfridge's (the American shopkeeper who conquered London) is outstanding. I have never seen it—except on a Sunday or a Bank Holiday—when it was not thronged from curb to curb with traffic.

Today I found a thin string of vehicles with gaps of several blocks in it now and then. There was something vital missing too, the second story of the traffic, that gave it color and volume and sound. For a moment I could not remember. It was the London busses of course, those towering, swaggering, roaring vehicular bullies. They were missing for the first time that one could remember. How kindly and good-natured—ready to stop at a lift of the finger and carry one on their broad backs anywhere from Wimbledon to Morden. Why, London was a trackless morass and walking wilderness without them. London without its busses? It couldn't be! That familiar lumbering line of double-deckers crawling along every thoroughfare seldom more than a hundred feet apart, all colors of the rainbow, swaying like shapeless elephants in the vehicular circus parade. Nevertheless, there was not a bus running in all the great city of London. To anyone knowing London, this was as uncanny as though the smell, the mist and the grime of London were not there. Of all the things that happened to London, this stripping it of its busses was the most startling, in my opinion.

* * *

Although there were many people on the streets, few of them were buying goods. Later in the day, the manager at Dickens & Jones, one of the largest department stores, told me they had sold only a few pounds' worth throughout the day.

Selfridge's had seized opportunity in true American fashion and was gathering in publicity and ladeling out service at the same time. The store immediately established the only first-class news-dispensing service in the whole of London and became the interest center of the whole city. Enormous crowds gathered in front of the shop to watch the traveling electric sign opposite, or to listen to announcements being broadcast every hour or to read the bulletins pasted on the windows. It seemed to be the *only* place in London where one could get information, as one was forbidden to use the telephone for this purpose.

Strikers surrounding busses with intention of cutting their fuel feed.

As a further service, Selfridge's issued a small typewritten newspaper which was given away 'free of course' at the corner.

Meanwhile, dozens of 'bulletin newspapers' began to appear on the streets. They were nothing more than typewritten or mimeographed pages repeating over and over again the meager news and were eagerly bought up at two pence (4 cents) each.

The window bulletins and news vendors were surrounded by half-stupefied crowds throughout the day, who read them bewilderedly, the expressions on their faces plainly saying: 'No, this can't be—*our* England? No.' To them, it was as though England had been betrayed from within. They shook their heads solemnly and turned to look on the unbelievable sight about them. In Piccadilly, in Trafalgar Square, in Whitehall crowds just stood and watched the other crowds pass by. They smiled at each other.

There were a great many things about it all like that awful morning of the First of August, 1914. It was the same sort of crowd, the same sort of feeling in the air and the same sort of

Miners and their wives near the Whitehaven Colliery.

smile when they had pitched in at that First Call. They lighted their pipes and cigarets and shoved their hands deep into their pockets and were good-humored about it, although aghast at it all. And in that first twenty-four hours more than 50,000 had volunteered as stokers, engineers, shunters on the railways; as bus drivers, constabulary police; turned over their cars and themselves with them, were driving milk or food wagons.

What can a strike do against that sort of spirit?

The greatest moments in the big show were between five and seven, when the several hundred thousands who could get to work turned out to try to get back to their homes. Everything on wheels was *(Continued on page 26)*

# The Voyage of the Victoria

## WESTWARD HO!

*Fifth of a Series*

Pigafetta kept a journal from which much information is gleaned.

BY CHARLES J. FINGER

WOODCUTS BY PAUL HONORÉ

WITH the fleet there happened to be three men who had the habit of setting things down in black and white. One was Francisco Albo, mate of the *Trinidad*, who kept a log. Another was Juan Bautista Poncevera, who kept a kind of journal which ultimately fell into the hands of the Portuguese and was published under the title of *The Genoese Pilot*. Then, after the death of Magellan, Sebastian del Cano kept a journal which may yet be discovered among the archives of the Valverde family.

But the most intimate record of the voyage was made by the first round-the-world passenger who joined the fleet at the last moment. He was an Italian, a knight of the Order of St. John, the Chevalier Antonio Pigafetta. His mission was adventure and the seeing of things, and the spirit of a Pepys or an Evelyn was in him so that he had to set down his impressions, not omitting the little and apparently unimportant things which mean so much to those who read at a later date. It is through his record, *Primo Viaggio Intorno al Globo*, that we are informed of much as to the voyage, though that knowledge is supplemented by other papers that grew out of strange doings.

Pigafetta seems to have been a bright, hopeful, energetic kind of man, one fully determined to make of life a pleasant and refreshing business, and as time went on he became a good shipmate, taking things pretty much as they came, good times and bad, fair weather and foul, plenty and hunger. He had a keen eye for details and his chief fault was that he was full of a Pickwickian credulity, swallowing every thing he heard, until at last, after much experience, he ceased to expect marvelous enchantments such as were told of by those who create countries out of their imaginations, in the style of Mandeville.

At the beginning, his journal tells of curious things, never troubling about evidence; of how a tree in the Canaries attracts a cloud from which water sufficient for the needs of the inhabitants is secured; of how birds in equatorial lands 'make no nests because they have no feet, and the hen lays her eggs on the back of the cock and there hatches them'; and while he grows milder in time, yet there are certain things recorded, especially about Patagonia, which have been given credence and quoted by very modern writers.

He established himself on terms of intimacy with Magellan, and before the fleet sailed had noted that 'the captains of the other ships have small love for their leader.' Seeing the admiral busying himself with rules and regulations for the conduct of the fleet, he wrote in his diary that 'the Captain-general is a discreet and virtuous man, careful of his honor,' and one who 'would not commence his voyage without making good and wholesome ordinances.'

In the light of later events, that 'careful of his honor' seems to cover an exaggerated consciousness of his own personality. As for the ordinances, the one most important was that the *Trinidad* should at all times lead the way, and that on its high poop a large lantern would be kept burning at night so that the other ships might have a sign, following the flag by day, the light by night. It was important, because it allowed arbitrary change of route before long, and out of that grew many difficulties.

Although the fleet was ten weeks behind the date as scheduled for leaving, there was a month's delay while the ships lay at anchor off the port of St. Lucar, at the river's mouth. It was another case of official carelessness, for some of the purchasing agents had suffered lapses of memory, and many necessities had not arrived. At the end there were other official muddles and much that was intended for the ships was left behind. And that month of delay gave time for the news of the projected voyage to spread, so when Portugal learned that the Haros and the Fuggers were behind the expedition, and that Portugal's trade in the 'spiceries' was threatened, thus touching the national treasury and the royal revenues, the dogs of war growled, though it was not possible for them to bristle provocatively.

So statesmen considered, voicing fears of possible clashings in the Far East, then set to work to bring about that which was feared by preparing ships of war to sail to the Moluccas by way of the Cape route around Africa, and preparing others again to sail for the River Plate with a view to intercepting the expedition Magellan commanded. Meanwhile, within the fleet there were dark clouds and hints of trouble, and two men were put ashore for insubordination.

But at last the fleet sailed, three months and a half later than the date set, and the day of departure was Tuesday, September 20, 1519. Six days later they were anchored off snow-tipped Teneriffe where they stayed three days, taking in wood and water. And there someone produced a letter from Diogo Barbosa, brought in by a caravel. It warned Magellan to 'keep a good watch, since it had come to his (Barbosa's) notice that the

captains had told their friends and relatives that if they had any trouble with Magellan they would kill him.' That may have been something, and it may have been mere wine-shop gossip with no reliable foundation.

It was when the fleet was between the Canaries and Cape Verde Islands, that without any notification or consultation with the other captains, the course of the *Trinidad* was altered. It was a small enough matter, but a peg large enough on which to hang a test case and an objection. So Juan de Cartagena tried conclusions with the admiral, and he was the right and proper man to do so. He was a royal officer, the appointed overseer of the fleet, a cousin of that Bishop of Burgos who had favored the expedition, and, most important of all, he was the appointed *conjunta persona* who had a right to be consulted. As for his personality, he was one always in favor of frankness and outspokenness, full of exasperation at whispering and plotting.

The move he made had all the elements of dramatic surprise, with enough dash and daring to interest all who saw and heard. For his ship, the *San Antonio*, left the line of sailing and ran in under the stern of the flagship. That focused the eyes of all on board the two ships upon Cartagena, who, standing well in view as the ships neared, in resonant and powerful voice and as if with royal authority, demanded to know the course. But Magellan in his spirit of mastery made no reply. There was about him something of the arrogance of the small-minded man lifted to authority. A little affability with his high-mettled questioner might have worked wonders. Cold politeness, the least that might be expected, would have left his critics without a word to say. But instead Magellan chose the exasperating course of hostile silence, bidding the pilot make reply, as monarch might order some official mouthpiece to address a suitor of inferior rank.

However, Juan de Cartagena was not to be humiliated, the more because he had a perfect right to question and saw no reason why the course agreed upon had been arbitrarily changed. As the *San Antonio* ran alongside the *Trinidad*, he called across to Magellan, asking him directly for the reason of the alteration of course. Then Magellan's rage flashed forth and he ordered his appointed colleague away in much the same manner as a policeman might bundle an impudent and noisy intruder ignominiously out of the way.

'Your business is to follow my course and ask no questions,' was what he said. (*Que le siguissen y no le pidiessen mas quanto.*)

Juan de Cartagena looked Magellan in the face as the ships raced side by side, then shot forth a warning about the danger of keeping too close to the African coast, and at his signal his ship dropped behind and into place. The incident seemed to end there, but it did not, for resentment burned in Cartagena like a fire in his breast. At once it was known over the whole fleet that the admiral had refused to acknowledge his appointed co-adviser with all the tactlessness of a coarse egotist.

After that the fleet ran into two months of bad weather and was in a region where hurricane succeeded calm. Their course had taken them into the circular zone of calms at a time when calms are most frequent, and before two months had passed the crews were on short rations, some four pints of water and a pound and a half of bread being the portion of each man. That rationing was a burden which men bore with ill grace, and a kind of sulky humor settled on the crews.

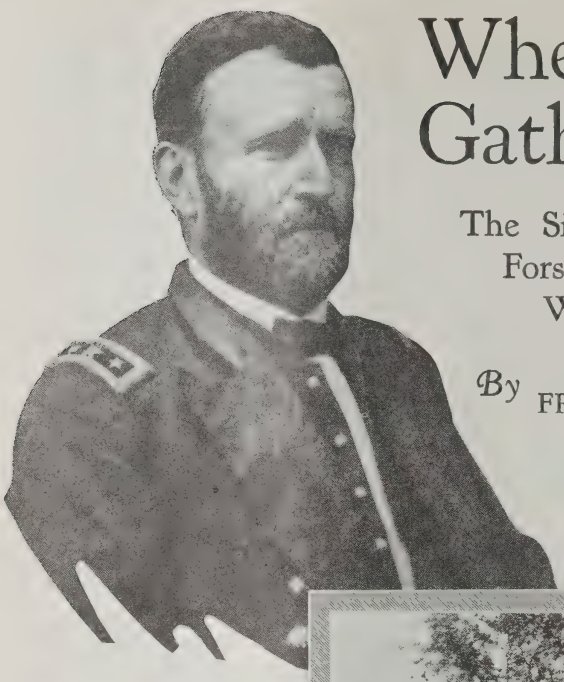
Meanwhile, Magellan had ceased to consult with his fellow officers and discontent thickened; but while the consultations were suspended, the admiral would not suffer any diminution of the outward respect accorded to him as master. He insisted that the different captains should continue to hail and salute the flagship each morning.

One day, as they neared the equator, there was a sharp quarrel between Magellan and that stalwart champion of the opposition, Juan de Cartagena, who was always exhilarated at a clash. Of course it was all in the nature of a revenge. Magellan had refused to accord him the honor which was his due, so he, in his turn, would refuse to give Magellan the full measure of honor he demanded. It was a piece of childish business looked at in the light of common sense, and the consequences were unexpected and far-reaching; but commanders of men are no less given to take mean and wretched points of view than are subordinates.

One day then, the *San Antonio* saluted the flagship, and the quartermaster gave greeting with:

'God save you, master captain, and good companions all!'

Now Magellan's title was captain-general and by that he expected to be called, so it is not difficult to imagine the whisperings and nudgings among the men of both ships at the bearding of the lion. It was well enough known that Magellan valued ceremonialism tremendously, and was jealous of his prestige. The badgering made him furious. His title, he told Cartagena, was omitted in the salute, and that was an (Concluded on page 29)



Magellan ordered his pilot to deliver his message to Cartagena.

# When General U. S. Grant Gathered Hides at Galena

## The Simple Story of a Man Who for a Time Forsook Army Life to Engage in Humble Ways of Earning a Living in Commerce

By FRED L. HOLMES

General Grant and the home presented to him by the citizens of Galena. It is now used as a museum.

BESIDE the crooked, twisting main street of Galena, Illinois, there stands today a two-story red brick building, with heavy gray stone blocks for window ledges. Like the other fiery, clay-colored shops which crowd the narrow thoroughfare, it has an old-world appearance. The narrow structure is the remnant of a decade when Galena was one of the important trade emporiums of the Mississippi Valley; when over its river levees passed a motley horde of emigrants who came to settle in Illinois, Wisconsin, and spread westward into Iowa.

Galena was a headwaters navigation port for river trade that extended as far east as Chicago. With the coming of the railroad, its river significance dwindled with its population. The quaint inland city now nestles in the shadows of its towering hills—and the extended shades of the inconspicuous clerk who worked in the old red store building.

Seventy years ago the structure was used as a leather shop in whose basement green hides were piled for shipment to St. Louis for tanning. It was here as a clerk for his father, before the Civil War, that Captain U. S. Grant made his renowned struggle against poverty and adversity. From it he went forth to join the Illinois Volunteers and to become a world-famed general. As a discouraged citizen, the people of Galena gave him scant attention. After the world had discerned his greatness, Galena awoke. Then upon him it showered honors; dedicated a park in his memory and built him the home from which he was called to the White House and the presidential chair.

Now Grant and Galena are inseparably linked in history. Other cities may advertise to tourists their commercial importance; others may acclaim their picturesque supremacy, but Galena announces on signboards which direct the dusty way to the city one single fact—'Home of General U. S. Grant in Manhood.'

The story of General Grant at Galena doesn't relate to military achievements, or to Grant's eight years' service as President, or to those final days, forty-one years ago this summer, when his pen raced with death in the effort to complete the last pages of his *Memoirs*. All of that has been told long ago by others.

Rather, it is the simple story of a man who had forsaken army life in the hope that he could gain a sufficient competence to support his family; of one who had turned from years of West Point training and Mexican War service to engage in humble ways of earning a living in the commercial world.

One of the duties of Grant, the leather store clerk, was to visit the farmers of this vicinity, collect outstanding accounts and gather a few hides. The packing and tanning industries had not then been developed. Slaughtering was done on the farms and the hides sent to market, the pelt being as valuable as the animal's carcass.

During the spring of 1860 Grant canvassed through the community. He drove a span of bay horses, hitched to a Democrat wagon. He was scarcely ordinary in appearance, his short, stubby, unkempt beard and stooped form being the distinguishing physical characteristics. He was a man of few words. At one farmhouse he examined seven hides that had been salted down, rejected two and gave an offer on the five, which was accepted. He paid the price, piled them on the wagon and drove on. But during evenings, around the hotel firesides, he became more jovial.

Long before the main street is reached at the foothills, along the Galena River bank, one has learned from the guideposts of a city's devotion to his history. Across the valley through a clump of trees a big, white sign arranged from stones set in the hillside announces 'Grant Park.'

'Where is General Grant's old home?' I inquired of a pedestrian.

'Across the river and up the hill to the east.'

I mistook the turn, and stopped to make further inquiries of an old lady garbed in a shiny, plain, black dress, with a fringed black shawl hung loosely over her shoulders.

'You missed the corner. It's back the opposite way and up on the top of the hill.'

The Grant Memorial Home, to which the public is directed, is a two-story, red brick building, the gift of the people of Galena to General Grant upon his return six months after Lee's surrender at Appomattox. There I met Alfred Benninger, the retired, blind caretaker.

'We are keeping this place just as the General would want it were he to return tonight,' he explained as we sat on the back porch overlooking the yellowing hillsides of rock, broken at irregular intervals with the trees of early summer. 'I took everyone who called through the home, until I went blind. Now my wife must do it.'

'Do many people call?'

'Sometimes a hundred a day. We had more than three thousand visitors last year from all parts of the world. Many came from the Orient, because they say that General Grant visited their country on his trip around the world, after he retired from the Presidency.'

'Were you in the war with the General?'

'I was in the war, but not with the General. I knew him before he went to the war, but I became better acquainted with him afterwards. He didn't reside here until after the war. He lived across the river in a house on that high cliff nearly a mile away.'

The Memorial Home itself sheds a new light on General Grant's domestic tastes. At a desk is a chair used by him in the White House; on the wall a section of a log cabin in Ohio where he was born; there are sticks with which he climbed the Alps; a picture of Old Fort Humboldt in Cali-

fornia where Grant resigned from the army in 1854 after the Mexican War; the flags that flew over his tent on that long and bloody campaign in front of Richmond; the weather-beaten trunks that were used on the two-year trip around the world that began in 1877; framed pictures and letters of the General that marked important epochs in his life, and paintings and statues made by some of the noted artists and sculptors of his time.

Each day the furniture of the rooms is dusted and put into place as it was when the family left Galena for New York in 1880 after a rest from the world tour. The little, low, yellow bed with its coverlets of white neatly tucked in at the corners is arranged as it had been for him, when he resided here at intervals as a retired President. There was fresh water in the heavy china pitcher on the stand, as though the immortal guest were coming in the evening.

Adjoining the bedroom of the General, on the second floor, is the neatly arranged room of Mrs. Grant. Near the dresser are her satin slippers. In the closet are the traveling trunks. Down the hallway is the room of their daughter Nellie. All is as Galena people want it—as Grant's family had it. The touch of electric lights and a telephone in the hall are the only innovations.

'After the General returned from the war I used to talk with him every few days,' Mr. Benninger went on. 'I can see him as though it were yesterday, seated out there under the big tree, cross-legged and slouched down in his chair, holding his cigar in one hand and the lapel of his coat in the other. He always sat that way. As I passed down the street, he used to call out, "Alfred! Come over here."

'I would cross over and tell him that I was at his service. Sometimes he would tell me to bring back the mail, or a box of cigars. And sometimes he would tell me to bring some eggs from my place. I always sold eggs and vegetables at the Grant home.'

My attention was attracted to a little frame building, with a square front beside the back kitchen door.

'What use did the General make of that building?' I inquired. The aged caretaker began to laugh.

'I am glad you thought to ask,' he responded. That little building, about eight feet square, was erected at the request of the General, when he returned from his world tour. He brought a Chinaman back with him; I guess people would call him a valet. The Chinaman lived in that house, cooked his own meals and took care of the General until he went away to New York.'

Grant was born about twenty-five miles above Point Pleasant, on the Ohio River, April 27, 1822. The parents christened him Hiram Ulysses—Hiram because his grandfather liked the name and Ulysses because his step-grandmother had been reading Fénelon. Seventeen years later the boy was appointed to the United States Military Academy. According to the father, the name was changed by mistake upon his matriculation at the institution.

'Mr. Hamer, knowing that Mrs. Grant's name was Simpson, and that we had a son named Simpson, somehow got the matter a little mixed up in making the nomination, and sent in the name Ulysses S. Grant,' according to the father's version. The new name stuck like a burr and as the years passed other appellations were coined by ingenious enemies and friends—'Lys, Lyssus, Useless, Uncle Sam and Unconditional Surrender.'

In 1843 Ulysses Grant was graduated twenty-first in a class of thirty-nine, and reported for duty as a brevet second lieutenant, Fourth Infantry, at Jefferson Barracks, near St. Louis. Two years later he received a full second lieutenantship in the Seventh Infantry at Corpus Christi, Texas, and on May 8, of the following year, was in his first battle at Palo Alto. In the several Mexican War engagements which followed he distinguished himself for brave and meritorious service and was awarded the rank of full lieutenantship in 1847.

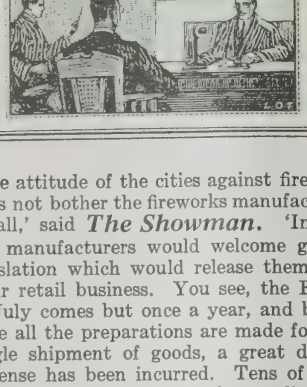
After he married Julia B. Dent, of St. Louis, in 1848, army life became the more irksome. Grant was ordered to the Pacific Coast in 1852, but on July 31, 1854, resigned from the army at Fort Humboldt and returned to civil life. He wanted to be near his family and he did not believe that the emoluments of an army officer were sufficient to support those dependent upon him.

The beautiful park in Galena dedicated in honor of Grant.

'Whoever hears of me in ten years will hear of a well-to-do, old Missouri farmer,' he told his army friends.

In the autumn of that year he took up life on his father-in-law's farm near St. Louis. With his own hands he built a log cabin on some of the land and named it 'Hardscrabble.' But he did not prosper in spite of his own recorded diligence. In 1858 he sold the farm at an auction and went into the real estate business at St. Louis. Again he failed. He sought the position of county engineer, but his opponent was more influential in politics. Again Grant lost.

As a last hope he appealed to his father. He was sent to the branch leather store at Galena on a salary of $800 a year. There was little work for him to do and his brothers gave him the menial tasks about the establishment. When the spring of 1860 came they dispatched him about the country to gather hides and collect accounts.



To Galena in 1860 Grant moved his family. High up on the west bluff of the river they settled in a red brick home. From the sidewalk in front of the residence, whose cornerstone bears an announcement of its former distinguished occupant, one may see the spire of the Methodist Episcopal Church in the valley below, where the family went to worship every Sunday.

'General Grant told me before he went away the last time,' declared an aged soldier who lives nearby, 'that the happiest days of his life were spent while he was a clerk in Galena. He said he was getting acquainted with the people, was supporting his family, and felt that within a few years he would be comfortable. But I always thought he was more silent as a clerk and more friendly after he had served as a general and as President.'

With the election of Lincoln in the autumn of 1860 and the rumblings of civil war, Grant began to talk more freely. Citizens would stop 'Cap' on the street and question him, because of his military experience. His replies were quickly repeated. Grant in his *Memoirs* tells of this increasing interest in the impending crisis.

'I traveled through the Northwest considerably during the winter of 1860-61,' he declares. 'We had customers in all the little towns in Southwest Wisconsin, Southeast Minnesota and Northwest Iowa. These generally knew I had been a captain in the Regular Army and had served through the Mexican War. Consequently wherever I stopped at night, some of the people would come to the public-house where I was, and sit till a late hour discussing the probabilities of the future. My own views at that time were like those officially expressed by Mr. Seward at a later day, that "the war would be over in ninety days." I continued to entertain these views until after the battle of Shiloh.'

When Fort Sumter was fired upon Jo Daviess County awoke. Grant helped to drill the local soldiers. Enthusiastic people attempted to get him to address a patriotic gathering, but his words failed him. Again he lost prestige. But shortly thereafter he tendered his services to Illinois and after some delay Governor Yates accepted them.

# CHATS WITH OFFICE CALLERS

'The attitude of the cities against fireworks does not bother the fireworks manufacturers at all,' said ***The Showman.*** 'In fact, the manufacturers would welcome general legislation which would release them from their retail business. You see, the Fourth of July comes but once a year, and by the time all the preparations are made for that single shipment of goods, a great deal of expense has been incurred. Tens of thousands of small shops have to be supplied with nickel packages, and, taken altogether, it isn't much of a business. But with the suppression of private celebrations there comes an increase of public or community celebrations, and that means big sales. The community as a community will blow up more powder than it will as individuals, and buy the most expensive methods of doing it—besides hiring an expert to superintend the affair. These are the kind of customers the fireworks men like—community Fourth of July celebrations, spectacular historical pageants, State and County Fairs, and such like things. The manufacturers don't miss the small boy with his nickel package of firecrackers at all.'

ɤ ɤ ɤ

'One of the members of the President's Cabinet is very nervous,' said ***A Traveler from Washington.*** 'No, I don't mean the Secretary of the Treasury nor the Secretary of State. They call one of them "Nervous Nellie," but it is not a well chosen name. The Cabinet member I know carries a quite different front. You would think he had the hide of a hippopotamus. But he is very thin-skinned as a matter of fact. His nervous and fidgety state is indicated by the number of people he has reporting to him the things they hear; a sort of private espionage system on people's opinions of this particular Cabinet member. He frequently gets reports that this or the other paper is going to attack him, and then through devious channels he finds means to let the paper learn that he is aware of its intentions. The funny thing about it is that so far the reports have been wrong. But it has set the papers thinking that perhaps this man who gets wind of so many projected attacks, that are not projected at all, may be in need of someone looking him up and telling a few salutary facts, just for the purpose of keeping public opinion in balance. I have just seen the last flurry this Cabinet member had. He was told very circumstantially what was going to happen. Upon inquiry, I found it was not going to happen at all. No one had even thought of it. Somebody seems to be feeding him fidget flakes.'

ɤ ɤ ɤ

'I wonder if you have ever seen the little "School of Philosophy" which stands back of the Alcott House in Concord?' asked ***The Down-Easter.***

'Yes,' said I, 'that and Emerson's house were the main magnets when as a youngster I made my first visit East. The "School of Philosophy" meant more to me than the Alcott House itself. I had not been brought up on Louisa's books, but I had often come across Bronson through my hero-worship of Emerson.'

'They're moving the "School" to a place it formerly occupied at the left of the house as you face it from the road, instead of at the right where you probably saw it,' said the Down-Easter. 'That is the position it held in the time of the Transcendentalists themselves.'

'That's interesting,' I commented. 'Now, I'll give you a little information about the "School" which may impress you. I had it from Mr. Chilton Cabot, of Concord. He says that the most reverent visitors to the "School" are Japanese. I do not exactly remember whether he said that few Americans visited the "School," or that few Americans who understood its place on the history of philosophy visited it—that point is not clear; but the most understanding of all the visitors were Japanese. They come quietly, and in quite impressive numbers in the course of a year. Somehow they seem to feel at home in the atmosphere of American transcendentalism. It struck me rather forcibly that the shrine of Japanese students in America should be that little rough lumber shed—that's all it is, just a shed—in the woods back of the Alcott House.'

'That is interesting,' said the Down-Easter. 'Thank you for the return bit of information.'

ɤ ɤ ɤ

'There were never so many young men in the schools of journalism as there are now,' said ***The Well-Seasoned Editor*** as he sat in The Office, after a survey of the country.

'Where do they go after they graduate?' I asked.

'Most of them go into the country,' said he. 'That is, they go to the smaller newspaper. We are entering a stage in this country where the smaller newspaper will regain the prestige it used to have.'

'Is the country newspaper so economically attractive?' I asked.

'Say,' said he, 'they're better paying propositions than lots of big city papers. I was surprised to see what is taking place throughout the nation. The newspaper in the small town is now under a type of management new in country journalism. The young fellows from the colleges are taking hold as editors and managers. They are making better papers and they are making better money. Some of the men I have just seen have businesses so attractive that most city men would jump at the chance. It seems to me that the newspaper business, in the country, was never in better shape.'

'Do the country papers run as much propaganda as they used to?' I asked.

'No. The reason so much propaganda used to be put across was this: it helped to make up the paper. Slipshod managers were always glad to have anything that filled up the space. It did not much matter to them what it was, as long as it was free. Some of the material was good, and arose out of an honest desire on the part of certain movements to educate the people. Other, of course, was not so good. But the modern editor is an educated man who can weigh the value of what is offered for publication. He can detect a wrong tendency. He has a sense of editorial responsibility. I look to see the prestige of the American editorial column revived in the small-town newspaper; there the editor will come into his own again, if he is at all capable of giving leadership to the thought of his community. I am in hearty agreement with the dictum of THE DEARBORN INDEPENDENT that The Country is still out in the country. Cities don't make this nation. The people of cities are not the thinking Americans. And outside the cities the American newspaper will recover its freshness and independence. Imagine any man running a yellow sex and slander sheet in a town of 8,000! His neighbors would run him out. It is decency and service that make money for the small newspaper nowadays.'

ɤ ɤ ɤ

'If an angel were to come to me and offer me the choice of a gift which should determine my career,' said ***The Man from the Country,*** 'do you know what I should choose? I should choose to be a clown. I mean a laugh-maker. I would not much care in what degree I was set, so it might be the kind at which children can laugh. You follow the best clown of all around the circus tent by the successive waves of childish treble that greets his appearance. There is only pure fun where children laugh. Well, that is where I should like to begin—making children laugh. There are two very, very great achievements in the world—one is to write the Christmas story that the children who read it remember to the end of their lives, the other is to spread laughter. I used to think that was a trifling thing. It seemed more substantial to give people money, or to start some great reform in their behalf. But that is not what people need half so much as having their minds changed, and you can change a man's mind with humor faster than with any other known power. Trouble will change it; work will change it; but nothing does it like gales of laughter, like gusts of fun which open for a moment the doors which show down and up into the bubbling jollity of life. The universe is not serious at all. God is not serious. Neither are we at our best and cleanest and freest and highest. Seriousness is a sign that something isn't working well, that a man has never touched, or lost touch with, the good nature of the universe. Do you remember when "the morning stars sang together and all the sons of God shouted for joy"?—that is, they laughed. That is the picture of the universe we are struggling to understand. And the laugh-makers, the men whose fun leave an afterglow of spiritual mellowness behind it—they are interpreting the universe to us. I don't care how much thought or wisdom a philosophy may have—how much humor has it? You can measure its truth by its laughing outlook on the world.'

# A Good Look at Our Young People

(*Continued from page 5*)

search in the files of the past—even the not distant past—reveals that in the 'good old days' youth was much the same as today and, at times, perhaps a little more so. I sat at dinner a short time ago with a prominent public official in an eastern state who described a recent visit to his alma mater.

'It's the same old crowd,' he said. 'Styles have changed somewhat and there's a new vocabulary that I can't quite master. But underneath it all, it's the same old crowd—with one exception: there is less "boozing."'

***The Present Resembles the Past***

Another college graduate of forty years ago, who seemed strangely willing to recall his own past as a comparison with youth today, related recently that 'never a morning came around that the college campus did not show one or two students under the influence of alcohol, whose condition was unreprobated by their contemporaries.'

If the memory of one's own youth were a little longer the young people of the present doubtless would fare less badly at the hands of their critics. The striking likeness of the youth of the present to the youth of the past is too readily overlooked. A good many of the phenomena that are said to characterize the present younger generation are not nearly so typical as we have been led to believe. We have already seen that the 'bobbed-hair problem,' if it remains a problem, is not new. A certain amount of drinking among young people—despite the propaganda—is not a post-prohibition phenomenon. And 'petting parties'—though the expression is a new one—were not altogether unknown in other generations than this.

There is another fact that must be borne in mind if one is to come to any fair judgment regarding young people: namely, that most of the current conclusions are based upon only a one-sided glimpse of the situation, with the other side neglected entirely. I recently observed the illustration of this tendency to jump to quick conclusions.

I was visiting in a great university of the Middle West, a denominational school that had been justly renowned through many student generations for the number of recruits which it furnished each year for the Christian ministry and the mission field. From time immemorial at this institution dancing has been under the ban. About two years ago the general evasion by the students of the rule against dancing led to its final abolition. Immediately the quick-conclusionists jumped to the statement that the ideals of the school were on the down grade and that students were no longer interested in matters of serious concern. But the additional fact received little attention that, in defiance of the prophets, this school during last year sent more students into religious work than in any previous year of its history.

***Record Number Entered Church Work***

Again, it is often conveniently overlooked that, for whatever social excesses may be found among the younger generation of the present, the older generation must shoulder no small share of responsibility. There is very little social viciousness on the part of youth for which frequent precedent is not set by adults—very often by parents.

Loose standards—even in dinner-table conversation—about customs and institutions which were held almost too sacred for jest a decade or two ago, work to shape the attitude of adolescent young people along lines which even the most careless parents would hesitate to approve. And when to this flippancy there is often added the combined and tolerated influence of low-class and widely read newspapers and magazines, and motion pictures of mongrel ideals, it is understandable that many young people have a mature sophistication long before they gain experience sufficient to temper sophistication with judgment.

In regard to youth drinking, this adult influence is particularly apparent. It should be pointed out that liquor plays a major part in the record of almost all youth debauchery. This, obviously, is not an argument against prohibition, but rather for more effective prohibition. The adult factor in this situation cannot be eliminated by legislation, unless adults—and parents—set the example themselves.

I rode for several hours recently in company with an elderly gentleman who was returning from a visit to his son in college. The conversation veered—as train conversations are wont to veer—to the subject of prohibition. My traveling companion, fresh from a collegiate atmosphere, discoursed at length on the vicious influence of prohibition on the morals of the younger generation. He interspersed his conversation with frequent sips from a monogrammed silver flask, which he passed over to me for examination with the statement:

***Young People Always a Problem***

'My boy gave me that.'

There is considerable significance in the recent action of a student group which stated that alumni and adult friends of the school 'entertaining teams, glee clubs, or other groups of students, are strongly urged to refrain from the use of intoxicants, and to show by their actions that they are in the class of thoroughgoing respecters of the law.'

In the interests of the truth—too often neglected—regarding our younger generation, therefore, some facts cannot safely be overlooked. To temper our present-day judgments one needs a little history and a fair memory to emphasize the fact that the young people of other periods have always constituted a 'peculiar' problem. To avoid falling victim to the shrewd propaganda that is abroad in the land, there is a further need to avoid the gossip-conclusions of those who only know or are interested in a one-sided account. Finally, before the younger generation is too generally criticized for the errors of its way, it is essential that some realization be born of the degree of adult responsibility for these conditions.

To say that the roadhouse, hip-pocket-flask description of the society of the younger generation is unfair is not to deny the accuracy of that picture when applied to certain groups which can be found in many of the fair-sized communities of the country. Enthusiast propagandists even allege that there are indications, which sound more conclusive than they really are, that drinking among youth has increased since the war.

Probably the best place to study this particular question is among college students. It is as a description of college life that some of the most serious charges are made against the present-day young people. These charges, moreover, always find their source in the liquor question.

Now there is hardly any escaping the fact that liquor, concocted out of a medley of poisons and sold as the genuine article, can often be secured near the average college. College towns have their quota of bootleggers, and 'speak-easies' are sometimes within walking distance of the campus. There is even said to be a class of bootleggers that specializes in college trade and those who profess to know report that a word, spoken to the right person, may result in the delivery of fake drinks sufficient to meet any of the so-called demands of those who are out for a debauch.

***Certain Great Events at College***

Quite aside from any unusual situation, the normal day-by-day bootleg trade in some college communities, particularly near cities along the eastern seaboard of the United States, is considerable. Last spring the senior class in one of the oldest colleges of America, in an annual confessional vote, accorded high honors, as a beverage, to water; but 'Scotch' was a close second and milk a poor third. Nine-tenths of the senior class smoked and two-thirds said that they drank. The vote, at this particular college, is rather a form of adolescent boasting and is not taken with too much seriousness, so the figures cannot be accepted as altogether accurate. That some of the students do drink, and with some regularity, is admitted, though the much greater number that drank before prohibition is generally forgotten.

There are certain great annual events in the life of every college, however, when some casual student drinkers are apt to join with the few immoderates. Three years ago Prom Week was probably the most noticeable of these occasions. Hip-pocket flasks were then in the heyday of their popularity. To drink was held to be the mark, par excellence, of sophistication and social defiance. One could find in cloakrooms and back hallways adjacent to the ballroom couples 'out for a snifter,' and some of the young people—with considerable bravado—sported flasks. Even more than at the prom itself, these conditions prevailed at the smaller informal dances that are a part of Prom Week at most institutions.

In relation to the prom and other purely student affairs, however, there has been a rather widespread improvement in conditions during the last two years. With few exceptions, this improvement has been brought about by action of the students themselves, usually through the student-governing body, or through the fraternal organizations within the school.

***Has Been Rather Widespread Improvement***

At the University of Tennessee a year ago, the men of the institution asserted that they would not 'tolerate the drinking of liquor by students at the public or private social functions of the university' and declared that 'we will take active measures, both individually and as a body, to eliminate

entirely drinking at these functions.' At a mass meeting of women students at the University of Wisconsin, more than 2,000 girls endorsed a proposal to enforce a social ban against men students who drank. The class of 1925 at the University of Pennsylvania, in celebration of Junior Week, took a 'dry' pledge for the duration of the festivities. At a meeting of the students of the State College of Washington, the students recommended to the administration 'the unqualified expulsion from the college of any student found guilty of having intoxicating liquors in his possession or of being under the influence of such.' Brown University's student-governing body recently went on record 'as being emphatically opposed to bootlegging and drunkenness at Brown University,' and pledged itself 'to take every possible step to stamp out such law-breaking practices.'

The Student Council of Lehigh University has ruled that 'any student guilty of being intoxicated at any university social function shall be brought before the Arcadia and punished for such offense and that the Arcadia shall do everything in its power to arouse sentiment within the student body against the use of intoxicating liquor.' Only a few weeks ago the fraternities at the University of Missouri undertook a campus-wide campaign against drinking. This action was supplemented by a declaration of the women students agreeing to blacklist from their social functions any men known to use liquor.

Out of more than two hundred replies received to a questionnaire sent out to the college authorities of American institutions a few months ago, all but twelve recorded that since prohibition drinking had definitely decreased among the undergraduate body.

I am not citing these incidents—and they might be multiplied—to prepare the way for the conclusion that drinking has been, or is, in immediate prospect of being wholly stamped out in the colleges of the country. I do, however, wish to emphasize that conditions, particularly at the time of the annual student social events, have considerably improved during the past two or three years. This improvement, moreover, has been very largely brought about by student action with the advisory coöperation of the college administration.

***Annual 'Big Game' Presents a Problem***

But it is another type of college festivity than that represented by prom week that constitutes the most serious problem so far as drinking and social debauchery are concerned. Prom Week, after all, is rather strictly a youth affair and often can be handled by the students themselves. The annual 'big game' or 'homecoming' presents a situation of another sort. With the influx of many rollicking and temporarily irresponsible old grads, campus conditions in some schools are apt quickly to get beyond the control of the normal agencies. The pace, very often, is set by middle-aged alumni desperately determined to convince the undergraduates that they are jolly good fellows and believing, doubtless, in their own inability to accomplish that end if they remain sober.

Then, after this adult-promoted drinking has gone far beyond anything that prevails at any other time in the year, these same old grads return to their offices and clubs to broadcast their observation that prohibition has increased drinking among college students. And back at college the students themselves, having played the game with the alumni, admit a general feeling of disgust with old grads in general, and their own crop of old grads in particular.

There has been some student effort to better conditions prevailing at these alumni-featured festivals. Prior to the homecoming at the University of Illinois a year ago, 3,000 students voted to sustain prohibition by 'individually standing for prohibition, asking visiting alumni at the big homecoming celebration to do the same.' Three thousand student signatures were secured to a petition backing this stand. The daily *Illini* declared in regard to this action, that 'we want to look back on the homecoming not only as the best in spirit and crowds, but as the cleanest.' There have been other proposals of this nature—but it still remains probable that the individual who desires to find evidence that there is drinking among college students will discover his material most readily at those celebrations for which the largest number of old grads have returned.

***Not a Drop to the Old Days***

So far as quantity consumption is concerned, I think it is safe to say that there is less college drinking and less of the attendant excesses now than three years ago, and considerably less than before prohibition. Recently I had occasion to make the acquaintance of an old janitor of the dormitory at a renowned Eastern college. Janitors, incidentally, very often know a vast deal more about what is going on on the campus than the dean.

'I suppose there is a good bit of drinking in the dorm,' I asked him after we were on friendly terms.

'Some,' he said, 'but not a drop to the old days. What they get now is bad stuff, and a little goes a long ways. But as for real drinking—these students don't know the meaning of the word.'

I have been surprised how frequently informed individuals of other colleges have confirmed that judgment. Fielding H. Yost, veteran athletic director of the University of Michigan, declared recently: 'I believe that I know that my crowd of boys with whom I come in contact are cleaner and better in every way than the crowd was ten or twenty years ago. I know that there is a great howl about drinking in universities, but I don't think the boys are drinking nearly so much as they did five or ten years ago.'

It is undeniable, of course, that the drinking which does go on at present is much more talked about than formerly. The glimpse of one hip-pocket flask provides easy basis for discussions and may lead to all sorts of far-fetched conclusions. Present-day youth suffer at this point because of their frankness. However unfortunate their habits may actually be, there is very little cant in their attitude and it is perhaps true that they make less effort than the young people of a generation ago to conceal their misdoings. This doubtless accounts in part for the fact that whether or not their diversions are more to be condemned than those of former generations, there are some indications that they are more talked about.

***There Is Little Cant in Their Attitude***

In the face of the present propagandist drive it is well to keep these facts in mind in relation to the youth of this generation. The ideals of some of them, doubtless, are not all that could be desired. But the vast majority believe in the same institutions and hold to the same ideals as other generations before them. If they are presumptuous, that, certainly, is one of the characteristics of the vitality of youth.

# African Lions Roamed in Hollywood

(*Continued from page 13*)

segregate and assemble complete skeletons from this matrix of bones and bitumen required a combination of skill and infinite patience which has been little appreciated.

Just to give a hint as to the length of time this 'Death Trap' operated, and the abundance of the fauna collected from it, some of the pits were excavated to a depth of forty feet, and there were bones even below that level. The remains of 2,600 saber-toothed tigers were identified. Twenty-eight elephants were found in one pit. When a ground sloth's skeleton was found, it was usually associated with the skeleton of a saber-toothed tiger; and the lion was found either with the horse, or the primeval ox. The inference from this is that the tiger with his specialized weapons preyed on the ground sloth, while the lion preferred horse flesh or beef.

Let us now take the back-track to the Colorado River where we picked up the trail of this game herd. At that time, as already stated, the Colorado River was just entering the Old Red Sandstone, and was then in a broad river valley without any of the impassable gorges which now obstruct it.

Is it unreasonable to suppose that the game of that day functioned very much as unmolested game does now? That they had their summer range and their winter range? That they followed up the river valleys to the green pastures in the high mountains in the summertime, and when the snows came in the autumn, they drifted down to the warm plains bordering the sea?

***The Tracks We Found in the Canyon***

That is how I interpret the tracks we found in the Grand Canyon: they were made by part of the same game herd that left their bones in the treacherous pools of the 'Rancho la Brea.'

But there is a still harder nut to crack; there is a question involved in this which has a far-reaching significance. Ignoring the others for the moment, let us take four of the animals dug up from the pits of La Brea. The elephant, camel, horse and lion: now extinct in California, type locality, Africa. Added to this list should be the ibex and rhinoceros; these were not found in La Brea, but their pictures, made by prehistoric men, adorn the walls of our canyons.

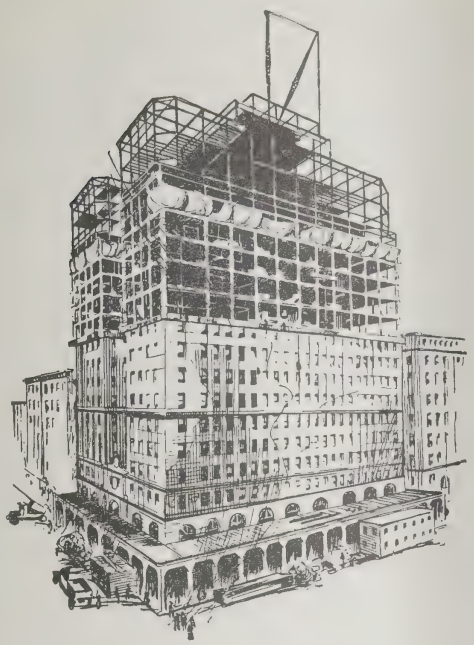
I assume that identical species were not evolved or created (take your choice) in different parts of the earth at the same time. To put it more concretely; if a lion once a native of California is practically identical with the lion of Africa, then they must be related; they must be descendants of the same ancestor.

If that is granted, then we are brought face to face with this proposition: either the elephant, the camel, the horse and the lion, began their existence in California and went to Africa, where their descendants still live, or they started in Africa and came to California, where the race died and became extinct. How did they get from California to Africa or vice versa?

Let us briefly review the facts. Four species of African animals were dug up in California within sight of the Pacific Ocean. Two species were known to prehistoric Americans, and pictured on the walls of the Grand Canyon. As they are all land mammals they must have walked to Africa or to Asia. We must not lose sight

of the fact that all these animals are or were found in Asia also, though Africa is the type locality. Therefore there must have been a game-trail leading to Asia across what is now the Pacific Ocean, or leading to Africa across the Atlantic Ocean. As additional evidence we pick up the trail some four hundred miles *east* of California, leading up the Canyon of the Colorado River.

On the Pacific side we have the long finger of the Aleutian Islands, pointing toward Asia. Also the narrow Bering Strait with the Diomede Islands halfway across. In the South Pacific is the vague tradition of the sunken continent of 'Lemuria' with the numerous islands forming its mountain tops.



For the Atlantic Ocean we have a similar and even more definite story of a sunken continent, which was said to have been west of the 'Pillars of Hercules' (Strait of Gibraltar). It was the land of Poseidon or Neptune, and the claim is made that its people were the first to tame horses for the use of man. Be that as it may, Neptune, the sea god, is always represented as driving a chariot drawn by three horses, and the three points of his trident are supposed to be symbolical of the three kingdoms of Atlantis. 'Atlas' was said to be the first king of Atlantis and from his name comes the word Atlantic. Soundings in the Atlantic Ocean between America and Europe show a great shoal known as Challenger Ridge, which many believe was part of this sunken continent.

Migrations of men and animals practically always follow the lines of least resistance, and the daily problem of *something to eat* must be the deciding factor. So it has occurred to me that the known habits of these animals may help to throw some light on this involved matter. With the exception of the ibex they are all *desert dwellers*. They naturally seek grassy plains or highlands sparsely covered with trees. Scarcity of water is and always has been one of their most serious problems, and when the water holes dried up they had to move. These animals could not live in a dense jungle or heavy forest, and they could not sustain themselves for any length of time in a rough mountainous country.

The elephant is the most versatile of the animals in our list, and he does climb the forested slopes of Mt. Kenia and Kilimanjaro, but he is there more on account of persistent hunting than from choice of habitat. In the same way our California elk was driven from the open hills and plains, and forced to take refuge in the tules bordering the San Joaquin River, where he is now known as the 'Tule elk.'

Now north of California, all the way to Bering Strait, we find an almost impassable jumble of mountains and forest, with no signs of flat plains or desert conditions either now or in the past. Eastward from California we find an almost ideal terrain for desert animals. Across Arizona, New Mexico, Texas and right to Florida, fronting on the Atlantic Ocean, any of these animals could have lived before the advent of the white man used up the grass and diverted the water.

So in the light of these facts I am constrained to believe that a prehistoric game trail led from California across what is now the Atlantic Ocean direct to Africa. At the risk of being considered scientifically unorthodox, I am becoming more and more committed to the idea of an Atlantean continent. And I am wondering whether it is possible that the shallow Gulf of Mexico and the Caribbean Sea were once part of the great Desert of Sahara?

The Monument to a Century of Service

Before the end of another year, the South's largest bank will be housed in New Orleans' largest bank building.

Towering skyward, story on story, the CANAL'S new home occupies a half-square in the heart of New Orleans' financial district, with entrances on three main business thoroughfares — a fitting monument to past accomplishments; a promise of continued resourcefulness; a symbol of permanent stability.

While the CANAL BANK has grown tremendously, it still has not outgrown personal contact with its customers—nor will it.

The surroundings and banking-room conveniences alone will change —this Bank, now as in the past, offers complete financial facilities, and an interested service, to sound business enterprises.

*Interested executives are invited to write for booklet: "Through Ninety-Five Years."*

Capital, Surplus and Undivided Profits Over $8,000,000.00

The CANAL BANK AND TRUST CO of New Orleans

# The New 'Real Estate Bond' Industry

(Concluded from page 4)

it all and possibly more on first-mortgage bonds.

'It is conceivable that many real estate mortgage bonds are being offered today which, in fact, encompass bonds, preferred and common stock and founders' shares all in one, without the investor knowing what he is really getting,' reported the real estate securities committee of the investment bankers' association in 1923.

The bigger the loan in ratio to value of property, the wider the margin for the 'investment banker,' and the higher the interest rate the easier it is to sell such bonds to inexperienced investors.

Excepting stipulations in the blue-sky laws of a few states, there is no limit on that ratio. The states which fix such limits allow a high maximum. Illinois, for instance, permits eighty per cent of appraised value to be covered by first-mortgage bonds. Many states fix fifty per cent as the limit for insurance companies and savings banks.

'The great majority of the committee believes that fifty per cent of present cost should be the standard with sixty per cent as the maximum,' stated the investment bankers' committees' report on this in 1923. The recommendation was opposed in a minority report signed by a representative of probably the biggest real estate bond house.

There is no standard method for making appraisals on whatever ratio established is based. Some concerns do their own appraising. Others employ 'experts' to do it for them. In one case covered by a circular in the writer's hands *one of the appraising 'experts' was an officer of the company to which the loan is to be made!*

Official appraisals are made only when the authorities take action, under blue-sky laws, in particular cases.

There is no fixed procedure as to the handling of funds pending the completion of properties that are thus mortgaged. Liens on account of unpaid bills for materials or labor usually take precedence of even first mortgages. The 'investment bankers' usually go only so far as to guarantee completion without prior liens. If the property is not completed they engage to return the loaned funds with interest.

***The Mail-Fraud Statutes May Be Invoked***

But what will happen in case the 'investment banker' also goes broke? The investor simply will be out of pocket, unless the money has been put in trust, which is the practice of some of the operators. The investment bankers' association committee recommended that such be made *the standard practice.* This was opposed by one of the biggest operators in the real estate bond field.

The leeway for connivance between irresponsible 'investment banker' and unscrupulous borrower is immense. The latter may be only a stalking horse, as probably is sometimes the case.

In most states the general provisions in blue-sky laws might be invoked against outright dishonesty. The mail-fraud statutes may be invoked when outright fraudulent operations are carried on through the mails. *It is not yet settled that state blue-sky laws apply to interstate operations.*

None of these protections operate when the risk is not rooted in patent dishonesty. They make no pretension of safeguarding the public from *risks* inhering to factors other than gross deception and fraud.

What these are in the case of the run of real estate bonds distributed among small investors is beyond accurate reckoning. Despite its repute as the best of all security, real estate is subject to manifold fluctuation in value. Following the Civil War the insurance companies invested heavily in mortgage loans. Times changed and many of them suffered serious losses. One may be sure that no 'investment banker' was ever more careful or conservative in the premises than insurance companies always have been.

'No real-estate bonds,' says Chamberlain in his *Principles of Bond Investment,* 'should be bought without even closer scrutiny than is given to the ordinary security; for they are seldom prepared and sold by experienced banking houses and in this country they have not had the "seasoning" that only time can give a class of securities.'

***Guaranties by Surety Companies***

One of the newest developments in connection with these securities is a practice of 'guaranteeing' payment of interest and principal. Sometimes the issuing house puts its 'guaranty' upon the bonds sold. This is of value only in the degree that the house is able to protect its guaranties, or, rather, will be able to do so in future.

> 'The idea underlying a bond issue is absolutely sound. Like other good things, however, the idea has been abused, and many "investments" are being sold today under the name of bonds which would never be recognized by the founder of the idea.'—*Roger Babson.*

If the house has large assets or, better still, puts in trust funds for protecting its guaranties without regard to what happens to itself, this practice then gives the investor additional protection of account. The practice makes the house a modified banking one; for, when it guarantees bonds sold by it, the issuing house is really accepting money on a time-deposit basis. The real estate securities committee of the investment bankers' association rather frowns on the practice.

Several 'investment banking' concerns now offer real estate bonds that are guaranteed by surety companies. The investment bankers' association committee is not enthusiastic, according to its reports, for this practice.

'The actual experience of the surety companies in guaranteeing this form of risk has not been sufficient to determine fully the extent of the risk involved,' says the committee's report for 1925, 'especially in contemplation of a large volume of business over a wide area and dealing with companies of varying degrees of experience, qualifications and standing.

Such a system, unless carefully safeguarded, might result in a false sense of security and the issuance and purchase of many doubtful securities. Moreover, it probably will result in giving a wider market to a class of securities than they intri sically deserve.'

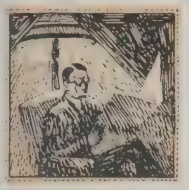
A surety company's 'guaranty' in t premises is measured, like that of the iss ing house, by an ability to make good case of changed conditions. One compar advertises that the surety company whi 'guarantees' its bonds has assets of $3,00( 000. The ability of that company to susta guaranties during a period of depression obviously limited to a comparatively sm volume of operations.

'Experience has demonstrated,' sa an authority on the subject, 'that the be guaranty from loss, both from the stan point of the lender and the investor, ar incidentally the best interests of the bo rower, is the character and the experience the issuing house, conservative appraisa a substantial equity in each property, car ful supervision, and a provision for co tinuous reduction of the loan.'

How is a clerk in Chicago, a farmer Wisconsin, a mechanic in Richmond, teacher in Denver or a minister in Michig to test the offerings of varying kinds 'real estate bonds' now flooding the count at the rate of around a billion dollars' wort a year by the rules thus set forth?

As a fact, few can or even try to do s They buy on the words of 'investme bankers' who are often far removed ar whose advertising and other literature fr quently may be misleading, particularly c the score of what is not stated.

Here's a circular describing an issue $1,300,000 worth of bonds on a property Philadelphia by a house in another cit A third of the space is filled with picture one of the property that *is to be* and the oth of nearby property—that also *is to b* The circular contains not more than 2,0( words of explanation and description. A insurance company or savings bank offici who invested funds in his care only on wha is set forth therein would land in prison.



***The Big Danger Lies in the Future***

The wide distrib tion to be given the is indicated by th fact that the bonds a to be sold in $100 to $5,000 denomination One of the smallest amounts can be pu chased on the basis of $10 down and $1 a month. Hundreds of persons no doubt w join in assuming that mortgage, on th strength of what is set forth in a brief ci cular by the issuing house which probabl is getting a commission of fifteen per ce or more for floating the loan.

If the issuing house be a responsible or and continues so to be throughout th period of the loan, if the borrower is a ma of honor and makes a success of the ente prise, all no doubt will come out well f the 'investors.'

But many holders of those kinds 'mortgages' may find themselves some da holding the bag for issuing house an borrower.

Several concerns operating in this sub stantially new field already have faile with large losses to 'investors.' But th building shortage, high rents, abnorma construction costs and generally goo economic conditions have tended to sustai the bulk even of the thinnest of first-mort gage operations. The big danger period lie in the future, the future that in many case is being capitalized, contrary to age-ol principles, in the form of mortgages.

# I Read in the Papers

Dr. Charles Frederick Pabst, dermatologist, professor of skin diseases on the staff of Greenpoint hospital, issued a warning to America's young womanhood. He declared that girls from coast to coast are destroying themselves and the race in an effort to keep thin. Dr. Pabst explained:

***Denounces Use of Drugs***

'Ten million American flappers are doomed to a haggard and anemic middle life by the craze for boyish forms. They are making sure of vinegar-visaged old age.

'The craze for flat forms is ruining the race. Young girls are swallowing poisonous drugs to prevent putting on flesh which nature intends they should wear.

'Cancer is the nemesis of the human race at this moment. To combat inroads of this frightful scourge we need healthy bodies. More than half our girls, the mothers of the future, are rendering themselves unfit by the fight against flesh, which has become nation-wide.

'The drugs our young women swallow daily would destroy a fleet of battleships. They do not realize that the human body is the most complicated chemical factory in existence. They treat their stomachs as though they were concrete mixers. There can be but one result.

'Girls of sixteen pursuing the methods of today will be shriveled old maids at thirty. They will be haggard and wilted, with red noses, puffy bags under their eyes and shrunken skins.'

---

'The London *Statist* recently called the roll of defaulting states and governments, and the list is an imposing one. It is headed by Russia, which owes in principal and interest between twelve and thirteen billion dollars. Eight of our own states are in total default upon certain issues of their bonds, which some of them have repudiated outright. The principal thus outstanding totals about seventy-five million dollars, with from fifty to eighty years' interest in arrears. This is exclusive, of course, of debts contracted by the Confederacy or by the Confederate States during the period of secession, which are recognized as outlawed. Latin America follows, though with relatively fewer delinquencies. Most of the debt of Honduras has been written off the books of her creditors. Ecuador has not paid anything on account of a mortgage of over ten million dollars on the Guayaquil and Quito Railway, which is now thirteen years overdue. The Argentine province of Corrientes is in total default, and the State of Pará in Brazil has not kept up its payment on debts of nearly fifteen million dollars. Mexico, of course, is temporarily in default for very large sums.

***Russia Owes Twelve Billions***

'China, which had a long record of solvency and honorable dealing prior to her revolutionary disturbances, is not paying interest on over seventy-five million dollars of external loans, and it is generally assumed that she will default on some fifteen million dollars additional the present year. Most of these loans are upon railways and are guaranteed as to principal and interest by her government. Egypt is withholding payment on something like seventy million dollars, while New Turkey has practically repudiated the borrowing of the old Ottoman Empire.'—From *The Living Age*.

---

How can newspapers talk about 'Clean Advertising' while they permit such ads as this, which is clipped from the Detroit *Free Press* of May 17?

***Too Frenchy for Smaller Towns***

It is rather shameful what some publications will do for a dollar.

TOO FRENCHY FOR SMALLER CITIES

*To the Amusement Lovers of the Mid-West:*

'GAY PAREE,' now playing at the Shubert-Detroit Opera House, will NEVER BE PRESENTED ELSEWHERE IN THE MIDDLE WEST, either in its present or attenuated form. As it has been the custom with Detroit successes to later provide them elsewhere, the management of 'GAY PAREE' feels in duty bound to explain WHY a deviation from the established rule is deemed necessary.

'GAY PAREE' is not only one of the most expensively cast attractions ever produced, but the magnitude of the production makes a road tour well-nigh impossible. However, these reasons might be overcome.

THE REAL REASON WHY 'GAY PAREE' WILL NOT BE PRESENTED OUTSIDE OF NEW YORK, CHICAGO AND DETROIT, IS THAT IT IS TOO FAR ADVANCED IN ITS CONCEPTION. When 'GAY PAREE' was fabricated, French ideas were employed. Those who have seen the Folies Bergere, Moulin Rouge or Casino de Paris will appreciate how far advanced these ideas are. CHICAGO, DETROIT and NEW YORK being more blasé and sophisticated than the smaller cities permit 'GAY PAREE' to be staged in its full pristine loveliness. To manacle 'GAY PAREE' in the handcuffs of bucolic bigotry would be as encompassing the chaste torso of Venus de Milo in ribbed vestments of commerce.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

Josephus, the Jewish historian, has been a point of stormy argument for a long time. His works, as we have them, are counted one of the secular witnesses to the historicity of Jesus of Nazareth. Scholars, however, for many years have contended that the passages relating to Jesus were spurious. Now comes a discovery of the Slavonic text of Josephus which was a Jewish translation made directly from the original Aramaic, and the famous passage appears even more clearly than in the text to which most modern readers are accustomed, for there is no doubt that our present Josephus was doctored all down the line by the 'scholars.' The original text of Josephus was in Aramaic, the same dialect that Jesus spoke, and the book was preserved in Mesopotamia, being carried thence to the South Russian Khazaros, who adopted Judaism about A. D. 900. These Khazars are the progenitors of most of the so-called Jewish types we know today, which are not Jewish at all. (See article 'Chazars,' *Jewish Encyclopedia*, Vol. IV.) Among these Khazars the book of Josephus is preserved. The Slavonic version has this to say of Jesus: 'Human in figure, he did things superhuman, thanks to some hidden power. Some believed he was Moses, others a man sent by God. He transgressed our Law and the Sabbath; but he did no wicked deeds, using only speech. His low-class followers impelled him into a mutiny in which he was arrested and punished by Pilate.' There is also a mention of the Mount of Olives.

***Josephus in the Original***

Even the Jews have been for a long time approaching the point of acknowledging that Josephus is a witness to the historicity of Jesus. Rabbi Klausner, in his volume *Jesus of Nazareth*, recently reviewed in THE DEARBORN INDEPENDENT, boldly announced this view.

---

Mrs. Stanley Baldwin, presiding at a meeting of the Women's Section of the London Municipal Society, at Westminster Palace Rooms, said:

***He Is a Man***

'I think we cannot do better, under the shadow of this national calamity, than follow the Prime Minister's words, "Keep steady." He has done all he can for peace. You know he is a man of peace, and night and day he has worked for a peaceful solution.

'Yesterday,' continued Mrs. Baldwin, 'I said to him, "It seems hard that you, who have worked all your life for peace and a better understanding among people, should be hoisted with this big strike." He looked at me and said, "Well, I'm sorry. It is rather like building a house of cards, going up story by story, putting a card here and a card there, and then something comes and brings the whole thing down flop. The only thing is that I must collect the cards—pick them up again and build again."

'I thought to myself, with pride, he is a man,' added Mrs. Baldwin

# Why the Great Strike Failed

(Continued from page 15)

called out—down to two diminutive office boys each pushing themselves along through the crowd on a single roller skate. All the vehicles that been lying peacefully in junk cemeteries and backyards of livery stables had been resurrected: a Victorian wagonette with cracked varnish and covered with mud acquired on dirt roads sometime before the beginning of the 20th Century; a real jaunting car into which no less than 10 people had been piled; a stingy little motor car built to seat one person which had generously taken on another passenger astride the radiator; an old dump cart that had previously carried stones or manure now carrying 20 well-groomed passengers, one wearing a top hat; here and there was a seagoing hack of the vintage of 1890, or a rummy looking hansom cab; there were scores of trucks and drays, arranged with seats on the sides and in the middle; beer trucks, sand carts, 2-wheeled and 4-wheeled; there was actually a tallyho in the procession; there were furniture vans and delivery wagons that were fairly stuffed with people and then the backs solemnly closed like dead wagons and they were driven off after having been handed in by grimy-handed cockneys from the top of a box and up a ladder.

There were motor cars of every year, make, price and description: three-wheeled ones from which the entrails protruded from the front in a ghastly fashion; small Austins only a little larger than our Kiddie Kars (but which cost 175 pounds!); Fords as usual coming to the rescue by the hundreds, Rolls-Royces doing their bit—every car exceeding its capacity, those built for two carrying five, every rumble seat (or dickey, as they call it in England) occupied by two smirking clerks or clerkesses sitting up very straight with folded arms like footmen, in one case two young men of Oxford Street sat with feet outstretched on the trunk rack of a limousine.

The motor cycles were doing their bit too: some with side-cars carrying three and sometimes two passengers clinging behind on the 'flapper-bracket' (as they call the hind seat of a motor cycle).

The bicycles were legion, thousands of them: rusty, musty, dusty bicycles that must have been in many cases reclaimed from the junk piles; in some cases a passenger was being transported on both the handle bar in front and on the mounting step behind; prim ladies in long skirts and flappers in skirts that were hardly a pretense; gentlemen in toppers and white gaiters from the city and fresh office boys doing risky stunts en route.

I don't think that there was ever a more diverting procession. Piccadilly Circus and Oxford Circus were real circuses now!

* * *

The second day saw a perceptible change in the temper of the people. The great crowds watching the bulletins or listening to the loudspeakers had grown very sober overnight. They seemed to be asking themselves: 'Are we downhearted?' Followed a great roaring response within them: 'NO!' But, as is usual when people ask themselves that question, they were downhearted. But England's spirit was up, which is equivalent to saying her back was up—against the wall.

In the faces of the women the change was noticeable. Fear came out. They were thinking, thinking of that Interminable Four Years which had begun just like this.

The Metropolitan Underground opened for restricted service manned by volunteers. Some 'gentleman' driver had run a train off the track near the Finchley Road station and about 60 'navvies' were laboring to get it back. At least twenty of the number wore plus-fours!

The man who punched the tickets in the wrong place was a kindly old gentleman whom I might have seen somewhere in a bank. The business men on the platform had an anxious look in their eyes as they paced up and down waiting for the belated train. They were still immaculately dressed but they wore a frown as they faced the ruin that had confronted them overnight.

The Metropolitan took you only as far as Baker Street (shades of Sherlock Holmes!) where you had to walk the remaining three miles if you wanted to go as far as Pall Mall.

I said you would have to walk. That is only partially true. A few busses had appeared—strange busses that had never been seen in these parts of London before. But more significant was the volunteer motor service. Every private car had been turned into a public conveyance. Here was a Ford marked in chalk on the side: 'Trafalgar Square—Brixton'; a Rolls-Royce bearing a neat printed card on the windshield: 'For Conveyance'; every passing car had some sort of a sign on it: 'Signal and I Will Pick You Up,' 'Ask!' 'Tell Me Where You Want to Go.' Others bore homemade placards: 'Piccadilly Circus—Hampstead Heath,' 'Leicester Square—Golders Green.' The Woman's Auxiliary was scoring strongly in this pick-up service.

Troops on lorries passing through Fleet Street on their way to the dock area.

When the Rush Hour began and crowds stood helplessly at the bus stops, then every car that was not already loaded to the gunwales drew up and added to its load.

But it was not until I saw a Minerva drive up in front of the Galleries Lafayette in Oxford Street and let four waiting midinettes squeeze in the limousine beside milord and lady and a fifth take the footman's place outside while the footman rode on the running board—it was not until I saw that, that my doubts vanished.

No strike could stand up long against that sort of spirit!

* * *

The Third Day was marked by a solid advance on all fronts.

It opened at midnight by the remaining unionized vehicular service going out—all taxis! This seemed serious in the cases of those who like myself depended on someone to get me to the steamship office where the charabanc should take the passengers to Southampton in the absence of rail service. Another offensive bit on the part of the strikers was to overturn several busses in Hammersmith and Poplar and to burn several private cars carrying passengers. Nothing could have hurt their cause more. It spurred volunteering just as

Typical of the crowds which gathered daily at the entrance to Hyde Park, London, to peer anxiously at the food the government had ready for emergency.

the sinking of the *Lusitania* once did.

Eight hundred busses of the General Company appeared on the streets manned by gay young clerks and college youths each with a blue print in his hand to convey some idea of the routes they were supposed to take through a London unknown to them as Somaliland. A Bobby sat up with each driver and they were protected by twisted barbed wire. Taxi stands were preëmpted by private service cars with no charge. Squares were glutted with them, volunteer centers were over-supplied and had to stop the inflow of them. The underground companies had been swamped by volunteers and had opened several of the many lines on a ten-minute schedule. More than 50,000 had volunteered for railway service and some trains were moving on every line. Lorries were moving food and charabancs were transporting people everywhere manned by volunteers.

But when I left London the next day in the Cunard Company's charabanc, the strikers had refused all compromise; the situation had grown more sinister. There were hints of revolution in the air as the shoe began to pinch and foodstuffs were rapidly disappearing.

But again, when, at Southampton docks, I saw the volunteers in lines from every walk of life being handed a metal check, then a heavy hand truck and later wheeling great loads like navvies, awkwardly portering heavy trunks and boxes for passengers—men dressed in every style, some in want, others in wealth, smiling all, yet sad over their England's plight that had brought them to this. I knew even then that the Great Strike was potentially over—although it did not end until a week later.

## Mark Twain as Traveler

WHEN Samuel L. Clemens was 17, he was filled with a burning wanderlust. He asked his mother for five dollars that he might start out to see the world. This was promptly refused, so Samuel defiantly announced that he would go anyhow. One stormy night he left his home in Hannibal, Missouri, and went to St. Louis. From there he worked his way to New York, Philadelphia, Washington, and then back to the home of his brother in Muscatine, Iowa, who gave him a position in his little job printing office. But Samuel was not content. His travels had broadened the boy's vision.

One snowy evening in the winter of 1856, while going along the street from work, Samuel noticed a piece of paper which had been blown against the wall by the wind. He investigated and found that it was a fifty-dollar bill. He advertised his find in the newspapers four days. Then, as no one claimed it, he went to Cincinnati, as he said, 'to take that money out of danger.'

From Cincinnati, Samuel took passage for New Orleans on an ancient tub called the *Paul Jones* and it was on this trip that he met the pilot, Horace Bixby. In relating the incident, Bixby said:

'I was chief pilot on the *Paul Jones*, a boat that made occasional trips from Pittsburgh to New Orleans. One day a tall, angular, hoosier-like young fellow, whose limbs appeared to be fastened with leather hinges, entered the pilot house and in a peculiar drawling voice said:

'"Good mawnin', sir; don't you want to take er piert young fellow and teach 'im how to be er pilot?"

'"No sir, there is more bother about it than it's worth."

'"I wish you would, mister. I'm er printer by trade, but it don't 'pear to 'gree with me, and I'm on my way to Central America for my health. I believe I'll make a tolerable good pilot, 'cause I like the river."

'"What makes you pull your words that way?" I asked.

'"I don't know, mister; you'll have to ask my ma. She pulls hern too. But ain't there some way we can fix it so that you can teach me how to be er pilot?"

'"The only way is for money. I'll teach you the river for $500."

'"Gee! I ain't got $500. But I've got five lots in Keokuk, and 2,000 acres of land in Tennessee that is worth two bits an acre any time. You can have that if you want it."

'It was finally agreed that he should pay me $100—borrowed from his brother-in-law—$150 in 12 months and the balance when he became a pilot.'

For nearly three years Clemens sailed the river. Then came the Civil War, and the occupation of pilot, for the time being, was gone, but the lessons of the river were in after years revealed in his *Life on the Mississippi* and *Huckleberry Finn*.

At last, however, the supreme desire of his life was about to be realized, and he was to make a trip around the world. This trip not only gave him a chance to visit different countries but enabled him to study his fellow beings, and to get under the skin of things, a habit which always made his writing picturesque and gave it a human touch.

FIGHTING FISH PATROL THE WATERS OF ADVENTURE LAND

Glacier National Park

*Open June 15 to Sept. 15*

COLD all Summer are the surface waters of the lakes and streams of Glacier National Park. Voracious trout, frequently of giant size, rise to your bait in the still as well as the rapid waters. Come, match your skill against this wily foe.

Hike, ride horseback, climb, explore. Tour in motor coaches and motor launches. Sleep in the open, in quaint log chalets, or in the completely equipped, modern hotels. Generous portions of excellent food will curb your eager appetite. Go as you please tours and other tours. Inquire today. Mail the coupon.

From June 15 to July 1, visitors to Glacier National Park will have an opportunity to see the Metro-Goldwyn-Mayer Motion Picture Company actually filming James Oliver Curwood's romantic story, "The Flaming Forest."

# What Has Become of Ben?

(Concluded from page 8)

died when he was a small child. His father had married again, but had been killed in an accident a few years later. Ben had promptly run away from home, and had been running away ever since.

His stepmother was called to testify. She explained volubly that Ben was probably the worst boy in the world. She said he was ungrateful and lazy and disobedient. She described how she had started in early to discipline him and make him a home-loving, helpful lad, and she lamented that everything she did only made him worse. She had tried scolding him and whipping him and starving him and shutting him up in closets. The only reward he gave her was to run away. When she got her hands on him once more she would punish him—and at the first chance he would run away again.

'Did you ever try kissing him?' asked the judge.

The witness succumbed to an attack of maudlin tears. She said Ben's face had never to her knowledge been clean enough to kiss, and she intimated that everybody was as much against her as Ben was.

I thought to myself that if I had been in the boy's place and this woman had ever tried to kiss me I would have run away so far that I'd never have been found.

The witness described how Ben had built a bonfire in the backyard that burned down the chicken coop, and how he had made a tent out of her best bedspread, and how, when she shut him up in the cellar as punishment for that, he had stolen a jar of jam out of the preserve closet and climbed out of a window and disappeared for a week. She couldn't understand such lack of filial affection. She appealed to His Honor, now, wasn't Ben a hopeless case?

The chief probation officer took up the story. Ben's police record had begun, he testified, two years ago, when the boy tried to run away from an officer who found him sleeping at night on a park bench. On that occasion Ben was sent to a school for dependent boys. He didn't stay there long.

*Ben's Wanderings in the Middle West*

When he was next heard from he was in Indiana. The police of a small Hoosier town wired Chicago that they were holding a small boy who seemed to think the bandstand in the public square was a good place to sleep. They thought Chicago was his point of origin and indicated that they would be quite happy to have somebody up there call and claim him.

So Ben was brought back and given his second day in court, and placed with a private family in Oak Park. The people in his new home were kind. Ben had his own room, and a comfortable bed. He stayed ten days.

The telegram came from Wisconsin, this time, and the Chicago Juvenile Court authorities began to feel that they had better assign one man to the job of permanent retriever for Ben. In the next institution that opened its gates to his wandering spirit he made phenomenal progress in his studies, and stayed quite a long time. The walls were high. But at length he scaled them.

The day after Ben was found asleep on the beach in Lincoln Park, the court decided to try him on his stepmother for a change. He tolerated this reunion long enough to make further progress in school, and to complete a self-imposed course of study in the ways of the American Indian. There was a public library branch near his stepmother's house. He slept in the parks when he felt like it, but retired for the night in the shadows under the benches instead of on them, so he didn't get picked up so often. Then he set out again one afternoon in what he conceived to be the direction of the Indian country, and it was on the morning after this that I made his acquaintance in Juvenile Court.

'Ben,' I said, 'I'm a good deal of a wanderer myself. Never stay very long in any one place. Just now I'm going to drive out to California again, over the Santa Fe trail. We'll go right through where the Indians live. Would you like to come along?'

'Oh, jimminy! Oh, say'—Ben's tongue got tangled, in his excitement, but his eyes gleamed. '*Will* you—will you take *me?* When do we start? This afternoon?'

His face fell when I explained I had arrangements to make that would delay us twenty-four hours. Then another thought clouded his eyes. 'But I haven't got any gun.'

'Now Ben,' I admonished him, 'you know very well we aren't going to *fight* Indians.'

'Yes, I know,' he admitted reluctantly. 'They're all pacified, ain't they? I've read all about the Navi-joes and the Zunnies and the Pueblos. They weren't reg'lar fighting Indians, anyhow. Lived in houses made out of bricks! But the Apaches—they was the fighters! Will we see any Apaches?'

*Tracking Indians in an Auto*

'Probably we will,' I said.

'Well,' said Ben, 'I think we'd better take guns. Never can tell. Indians just might go on the warpath again. Sometimes they do start an uprising again, you know; I've read about it in the papers. But of course it ain't like the old days, I s'pose.'

During the next twenty-four hours, Ben tobogganed from heights of elation to depths of despair, and then skyrocketted up again. He was mortally afraid that the last vestiges of the wild west would have been completely gobbled up by encroaching civilization before we could get started. He eyed my purchases of an auto-camping outfit with cold disfavor. Cots and sleeping bags seemed to him sissified, and he thought every hour I spent in shopping was causing needless and perhaps fatal delay.

'The West is vanishin' awful fast, you know, Judge.'

'Well, it's really lasted a good many years,' I comforted him. 'I think we'll still find some of it left, even if we do waste another hour or two.'

*INTERVIEWING Robert Frost for* THE DEARBORN INDEPENDENT *was a merry experience.*

*Frost, in his own South Shaftsbury farmhouse, in the light of a kerosene lamp, until three o'clock in the morning, discussed poetry, education, farming and other things.*

*To appear in next week's issue.*

We were off at sunrise next morning, and had breakfast of bread and jam as we drove. At noon we would have a square meal in some village restaurant, and to Ben the recollections of the morning's drive obscured the fact that his environment was very much like any Chicago lunchroom. Nights we camped on the farms, and bought milk and eggs at the house. Ben made a stove out of an old tomato can. Ben was quite willing to wash his face, I found, as long as he didn't have to do it in a bathroom.

He was bored when we spent the night in a hotel, as we did in Omaha and Denver, and I finally gave in to him and drove through the cities, to sleep in the open beyond. Nobody will ever know what sacrifices of a rheumatic nature I made for Ben's salvation. I wanted him to have such a heavy dose of wandering and roughing it, and to see so much travel, and be so disillusioned by the Indian reservations, that he would be happy to settle down and accept America's urban civilization.

*In the Land of the Navajos*

Not Ben. He never once saw things exactly as they were. I soon found I was living more in Ben's world of adventure than he was in mine. It was my own initiative that caused us to buy old army canteens in Denver. We filled them at the springs or streams and never deigned to use water from a well. I couldn't make Ben grow up, but he lifted fifty years off my shoulders. And we weren't either of us pretending. We didn't have to, when we climbed Pike's Peak, and got lost exploring the Garden of the Gods.

Then we started across the Divide. The very word charmed Ben's ears magically. I have crossed it countless times, but never thrilled as I did this time.

The land of promise was always a day ahead for Ben. One thing at least I accomplished for him. Indians fell into their proper perspective. We spent a whole day among the Navajos. Ben wandered about entranced, watching the children at play and the women weaving their soft-colored blankets, and cooking their meals. But when he had absorbed it all, he was ready to go on. He never admitted disappointment, but he stopped talking about Indians. The setting had been perfect: tents pitched in the dim aisles of a forest, and Indian braves disappearing silently into its depths. For a while Ben lived in the past century; but soon his wandering instinct conquered even his interest in Indians.

In turn the colorful weirdness of the Navajo desert, the uncanny mystery of the National Petrified Forest and the prehistoric cliff dwellings fascinated him. Ben still had a large part of the petrified forest in his pockets, when last I saw him, as 'souverneers.' He told me more than I had ever learned about the Pueblo Indians, and how they lived in their impregnable dwellings on the high cliffs, comparatively safe from their more warlike neighbors.

We arrived in Hollywood on October 23, our running time having been ten days. Ben entered a Hollywood high school, and seemed to have settled down. I thought he was a changed youngster, almost satiated with his experiences, which he had relished more keenly than almost any child I had ever known. He disappeared on February 1, three months later.

# The Voyage of the Victoria

(*Concluded from page 17*)

insult. So let Cartagena look well to it that things went differently in future.

Then Cartagena stood up, a man tall and well-built, and thrust forth a hand, at which silence fell like a palpable thing on the ships.

'I have saluted you through the best man on my ship,' he said, 'but another day you shall be saluted by one of my pages if the way of today does not please you.'

else Magellan was intent on forcing a quarrel upon his appointed colleague. At any rate things suddenly became tense. Cartagena said something and then came the explosion. Magellan started to his feet, then leaped at Cartagena, telling him that he was under arrest.

Part in wonder, part in astonishment, Cartagena called on Mendoza and Antonio de Coca for help, but they stood undecided,

Cartegena in the stocks in the hold of the *Victoria*.

looking on with pained amazement. Nor would action have been wise, under the circumstances, for Magellan was in his own citadel. In a minute it was all over. Magellan called, and armed men came running. An hour later it was known throughout the fleet that Don Juan de Cartagena had been deprived of his command and lay in the stocks on board the *Victoria*, and that his authority had been intrusted to Antonio de Coca.

But the new captain's tenure of office was short, for Magellan's plan did not include the holding of command by Spaniards. Somehow, somewhere, he was deposed, but why or for what cause, if any, other than Magellan's arbitrary wish, is not known. The chroniclers give no clue. All we know is that when the fleet sailed southward, along the South American coast, after leaving Brazil, Magellan's first cousin, Alvara de Mesquita, was commander of the *San Antonio*. And because of that a tremendous trouble arose.

It was all shallow tomfoolery on both sides, but the rollicking and fiery manner of Cartagena won him friends. At the same time, it was the general opinion that Magellan was quarrelsome and vain and untrained in seamanship. Then, trivial things are apt to set men on edge in tropical seas.

One day a sailor on board the *Victoria* refused duty and was put under arrest by his captain, Luis de Mendoza. It was more of an hysterical outburst than anything serious, but hysteria spreads where men are closely confined, so Magellan held a *consejua de guerra*, or council of war on the case, and all the captains were summoned to attend on board the *Trinidad*.

The trial itself was a minor matter and easily disposed of, but at the end Magellan made no attempt to dismiss the gathering. So officers fell to discussing things in general and nothing in particular. There seems to have been some vehemence, and soon the outspoken Cartagena was addressing the admiral in a tone of corrective criticism, or

# The Queen of Kipling's Mandalay

(*Continued from page 2*)

This was an unlikely dream, for Thibaw was only a boy, never thought of as a possible successor to the throne. Besides, he was considered mentally incompetent. But Sinbyumayin was persistent, and finally won over the king's ministers to her plan, using the argument that, with a weak king on the throne, the ministers would have more power, and more opportunity for graft.

So when a palace eunuch brought to the ministers a black book containing the names of all the princes, each one marked his vote for Thibaw. Old Mindon on his deathbed was surprised to have his advisers recommend Thibaw as his successor, but assented to their wishes. Thus it was that Thibaw and Supayalat became rulers of Burma.

Soon the king's ministers discovered their mistake. Thibaw they could handle easily, but Supayalat was more than they had counted for. When the princess who had been chosen to be the chief queen had established herself in the Middle Palace, Supayalat set up residence in the king's own quarters, and saw to it that no woman except herself entered Thibaw's private chambers. No fifty-three queens for him! Her next step was to discharge most of the king's advisers and to let him know that she would do the advising herself.

Under the influence of Supayalat and her mother, Thibaw imprisoned as potential rivals between seventy and eighty of his relatives, then had them put to death. They were thrown into a pit in the palace grounds, hastily covered over with dirt, and trampled by elephants.

A similar atrocity occurred later when a jail filled with political prisoners was burned down, after a pretention that the prisoners were seeking to escape. Many who died in this fire were of royal blood. These two acts were partly responsible for the occupation of Mandalay by British troops in November, 1885.

King Thibaw, who never had traveled except by palanquin or elephant, was loaded unceremoniously into a common bullock-cart, and hauled out through the city gate. Later, he and Supayalat were taken to Ratnagiri, an old Portuguese fort on the west coast of India. There Thibaw died in 1917, and after his death Supayalat was allowed to make her home in Rangoon.

My first visit with Supayalat was arranged through a Burmese schoolboy who had once been a classmate of the queen's son-in-law, Prince Htaik Tin Gyi. The ex-queen was then sixty-three. She never appeared in public, and almost never had visitors. Few of the 340,000 residents of Rangoon knew the location of her palace-prison.

Supayalat's audience chamber was indicative both of her poverty and her primitive tastes. In the center of the room stood a small table holding an artificial tree with green leaves and pink flowers. At the far side of the table, Her Majesty occupied a plush chair, and nearby sat her third daughter.

Htaik Tin Gyi entered first, bowing carefully in mock-reverence as he crossed the room. The other Burmans followed his example. They had removed their shoes downstairs. I was allowed to retain mine, although at the palace at Mandalay Euro-

peans had to approach the throne with bare feet and bended knees.

The Supayalat who rose smilingly and gave me her hand was far different from the flip girl of Kipling's 'Mandalay' poem or the jealous tryant whom British Tommies dubbed as Soup-Plate. Instead of the Burmese silks I had expected, I found her dressed in plain white cotton, after the manner of Indian women. The combing of her hair was also suggestive of her exile at Ratnagiri. She talked fluently, despite her barren gums. I was told later that while imprisoned in India she had become demented and had knocked out her own teeth.

The queen smoked imported cigars, and laughed banteringly at my declining to smoke with her. Our talk was through double interpretation. My words would be translated by a Burmese professor who sat on the floor near me, and would then be cast into a more formal court dialect by Htaik Tin Gyi. Only those of royal blood were supposed to speak directly to the queen, or even to look directly at her.

*The Sad Fate of Mi Hkingyi*

Knowing Supayalat's antagonism toward the British, I was careful to explain that I was an American, and that I had come to Burma neither to govern nor to exploit. I mentioned the friendly attitude of the United States toward Burma as expressed by the mission which her father had received at Mandalay in 1858. The queen then assured me of her high regard for Americans, and cited instances in which my countrymen had made her exile more tolerable. At one time, she said, some Americans had offered to take her to the United States.

There was crafty fire in Supayalat's eye as she made plain to me that she was Thibaw's chief queen—that she alone had sported the white umbrella. So learned Mi Hkingyi, I recalled, but only to myself.

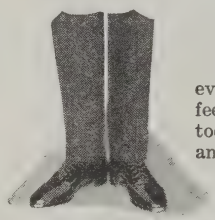
Mi Hkingyi was the pretty daughter of a Burmese nobleman, and among those chosen to attend Supayalat's first daughter at her christening. It was at this ceremony Thibaw saw Mi Hkingyi and fell immediately in love with her. The girl's parents, knowing Supayalat's temper, objected to Thibaw's marrying their daughter, but finally consented, after the queen's attendants had been threatened with instant death if they let her know of the new alliance.

The king then informed Supayalat that he was to receive a solemn blessing with consecrated water, and that in preparation it was necessary for him to fast in solitude for seven days. As she, also, wanted to receive this blessing, two small temporary buildings were set up in the palace garden. In one, Supayalat kept a genuine fast, and boasted much of her asceticism. In the other, Thibaw enjoyed a honeymoon with Mi Hkingyi. Supayalat's fury at this deception did not abate until Mi Hkingyi had been killed.

At the close of my interview with the queen, servants brought in big trays of fruit and sweets and sugar-cane sticks. After I had climbed into the gharry and was riding down the palm-lined lane toward the Royal lakes, I examined the faded photograph Supayalat had given me. It was the picture of a young girl, beautiful, innocent, and not yet spoiled. So Supayalat must have looked as palace maids prepared her for the great event of her youth, the royal ceremony of earboring. Little did she dream then of British guns or the lonely years of exile.

# A Dance A Week

## POSITIONS OF FEET IN DANCING



ALL dancing consists in taking five positions with the feet, in taking these positions in a given order and to musical time. Master these five positions of the feet and you have the basis of every dance, however complex or simple it may be.

While many excellent dancers have no knowledge of these positions, yet the beginner cannot do better than to understand and master them.

Just here it may be remarked that these instructions are not prepared *to be read*, but *to be acted*. If you wish to learn the things contained herein, do not merely skim them with the eye; act them out with the body.

These foot positions are hard to comprehend verbally, they are simple enough for a child *actually*. So act them.

### I.

**First Position**

Stand with weight evenly balanced on both feet, heels together, toes pointed out at an angle.

**Second Position**

Extend right foot directly to the side, toes touching floor, heel slightly raised. (In this movement extend foot the length of a natural step. Don't reach or bend for it; simply extend the limb its natural distance, foot pointed down.) Repeat five times.

**Third Position**

Place heel of right foot to instep of left foot. Resume first position and repeat five times.

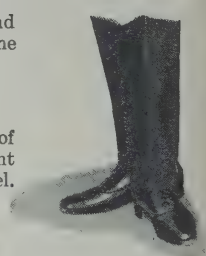
**Fourth Position**

Move right foot forward, as in walking (natural distance, no reaching or overbalancing) toe resting on floor, heel raised. Resume first position and repeat five times.

**Fifth Position**

Draw the heel of the right foot to the toe of the left, making the angle of a square. Resume first position, and repeat five times.

### II.



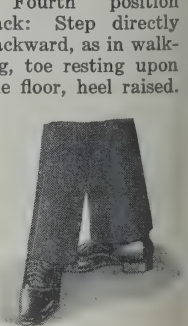
Now, having illustrated these positions separately, *try them in a series*, calling them off by number: ONE (feet together) TWO (right foot to side) THREE (right foot to instep of left) FOUR (right foot forward) FIVE (right heel to left toe at right angle). Repeat until the pattern of the positions is firmly fixed in the mind, and you can move from one to the other easily.

### III.

The same positions are then taken with the left foot. ONE—feet together. TWO—left foot directly to the side, toe touching floor, heel slightly raised. THREE—place heel of left foot to instep of right. FOUR—move left foot forward as in walking, toe on floor, heel slightly raised. FIVE—draw the heel of left to the toe of right, forming a right angle. The movements backward.

## POSITION BACKWARD

First and second position remain the same.



**Third Position**

Third position of the feet back; right instep to the left heel.

**Fourth Position**

Fourth position back: Step directly backward, as in walking, toe resting upon the floor, heel raised.

**Fifth Position**

Fifth position back: Place right toe to the left heel, at right angles.

For the left foot, the positions are the same, as in third position back—left instep to right heel, etc.

# Why Not Keep Faith With the Moro Race?

(*Concluded from page 7*)

cents a day. Capital costs amount to about $200 an acre. The cost of production per pound is about 12.56 cents. The total transportation charge to New York is 1.75 cents. A land tax of $1.35 on every $200, and a profit tax of three per cent upon the net income are the only additional costs. Added to these advantages are easy transportation to seaports, healthful living conditions and water power for hydroelectric development.

For the first three of the eight years required for the growth of rubber trees a combination of coffee raising is possible, and of grazing thereafter. For upkeep one laborer is required for four and a half acres. More are required for planting. There is no question but that the Moro provinces can supply the rubber tire needs of the United States for all time to come and relieve America of subjection to British rubber exactions.

Aside from the great rubber possibilities of the Moro provinces it should be remembered that the great bulk of land, nearly ninety per cent of that region, is still part of the public domain of the United States. More than sixty per cent of the entire public domain of the Philippine Islands is within the Moro provinces. The agricultural, forest, and mineral wealth in this uninhabited and undeveloped territory is exceptional. The finest coal bodies in the Philippine Islands are in Mindanao, as is also one of the greatest undeveloped bodies of iron ore in the world.

As long as the Moro provinces are under the Manila Government, however—the leaders of which are demanding independence—industrial conditions in this region cannot be stabilized.

There can be no peace in the Philippines so long as the Moros are under a Filipino administration. During all the years of the Spanish régime the Moros maintained almost complete independence. At no time were they under the complete control of the Spaniards. The Sultan and his datos made a separate treaty with the United States represented in the person of General Bates, by which they agreed to come under our flag on condition that we alone should govern them.

In 1898, small detachments of the American Army relieved the Spanish garrisons at Jolo and Zamboanga. The limited forces at the disposal of the Military Governor, and the crisis in the relations between the Americans and Filipinos, made it impracticable for the American Army to garrison the Moro country. Under these circumstances, General Bates dispatched a mission to the Sultan of Sulu and in 1899 concluded a treaty known as the Bates Agreement. Under this treaty the Sultan recognized for himself and his subjects the sovereignty and the protection of the United States.

Until 1914 the public peace was maintained by one of the most efficient forces ever maintained in the Philippines—The Moro Constabulary. This body was entirely officered by Americans and was recruited wholly from the Moro people themselves. The police work in the Moro country was conducted by its own people under American direction.

Taking advantage of the peaceful conditions that resulted from a separate government for the Moro country, the political leaders at Manila demanded more independence from the United States Government. They insisted on taking over the government of the Moro country. This was made possible by the Act of Congress of 1916, creating a Philippine legislature with full legislative powers.

One of its first steps was to replace the efficient Moro Constabulary by a hostile Filipino Constabulary. The administration of the Moro country under Filipino control has proved wholly unsatisfactory. It has served simply to arouse the age-long antagonism between the Moros and the Christian Filipinos and has precipitated unrest, trouble, and bloodshed. The rights of the Moro people have been subordinated to Filipino politics and policies formulated at Manila, and the Moros have never ceased to express dissatisfaction at the failure of the United States to keep its promises to them.

Rubber tree at Malaybalay, Mindanao.

The peaceful era of the American governors has been succeeded by an era of constant friction and bloody clashes between the Filipino Constabulary and the Moro inhabitants. During this period, the constabulary in the Moro region has been under Filipino command.

There is no hope of improvement under existing conditions. The justices of the peace, and all the judges of other courts in the Moro province, are now Filipinos. In other words, the administration of justice over a hostile people is entirely in the hands of their hereditary enemies. When it is realized that practically all the police officers, as well as the constabulary, are Filipinos, it can readily be understood that the Moro does not receive justice.

When the Moros laid down their arms they did it with the promise that this government would protect them. They do not expect protection from the Filipinos, and as a result the power of the Philippine Government is being rapidly undermined. The Moros are taking up arms against the Filipinos, whom they regard as infidels.

The only hope for peace in the Moro country is for the American Government to keep its promises to the Moro people. A treaty or agreement with this backward people should be as sacred to the United States as though entered into with a great power or civilized nation. The treatment accorded the Moro people by our Government is the only black spot in the history of American occupation of the Philippines. I am satisfied that when the people of the country become fully aroused to the dangers of the situation, and to the fact that the good faith and honor of the United States are involved, they will demand that we keep faith with the Moro peoples.

To this end I have introduced a bill to redeem the pledges made by America which will establish a separate form of government for the Moro provinces and will take them from under the jurisdiction of the Philippine legislature. Thus the matter will be squarely put up to Congress and through it to the American people.

Moro houses on the river bank at Cotobato.

# Wild Flower Gardens

## 'Pansy King' Developed More Than Seventy Native Plants; Black-Eyed Susan Becomes a Gypsy Queen

The ubiquitous black-eyed Susan has been educated into a civilized Egyptian queen.

'PANSY King' he was called. 'Pansy Farm' the neighbors have named his acres. But this Burbank of Wisconsin claimed neither appellation. William Toole, Sr., was until his death a few weeks ago the oldest member of the Wisconsin Horticultural Society. For nearly half a century he had been growing pansies and other flowers. The plants which he developed have made his name famous. He called his flower kingdom 'Garry-nee-Dule' which is the Gaelic for the 'Garden of the O'Tooles.' His son has succeeded him.

These fields are the school grounds for the education of many families of wild plants. In the garden plots of his farmstead he tamed the ubiquitous black-eyed Susan, who marches across the country in the early autumn as a herald of the brilliant pageant of wild flowers that are to follow, into a stately queen. Here was trained the flaming pleurisy root into a miss who rivals many flower folk with a background of centuries of breeding. Here will be found the demure wild asters, blue and purple, assuming the cultivated ways of civilization.

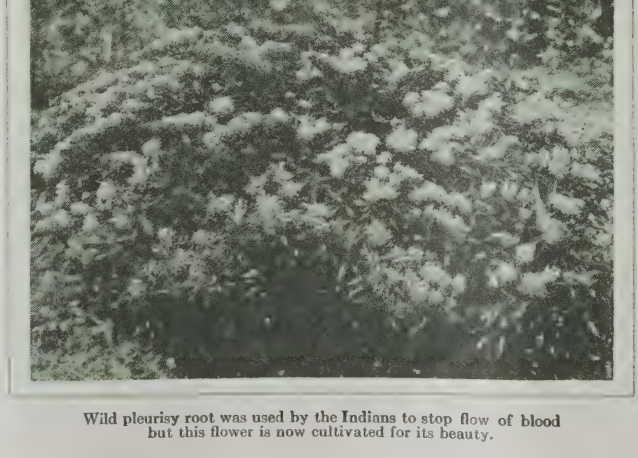
On the crest of highlands, where a state trunk highway that carries hundreds of geologists, university students, and tourists to visit the famous glacier deposits of the Baraboo hills sweeps over the headlands, William Toole had his farm. For forty years he had been growing flowers. Pansies have been in such profusion there that horticulturists, speaking of him, always refer to the tall sycamore, with a beard as white as the larkspur he has developed, as 'Pansy Toole.' The little pansy-face blossoms, all shades of the rainbow, were his dream children.

Great as has been his service in developing domestic plants with varying hues and tones, his greatest contribution will come as the result of his work with wild flowers. He has schooled more than seventy native plants to the uses of ornamental planting, 'bringing their beauty from the woods and fields to our homes.'

'I have simply carried on continuous seed gathering, selection and planting, with some gratifying results,' declared Mr. Toole, of Baraboo, Wisconsin, not long before his death. 'The kinds of native plants to which I have given most attention are New England asters, woods phlox, the prairie phlox and to some extent, pleurisy root, black-eyed Susan and the harebell. I have between seventy and eighty special native flowering plants growing. Their season of blooming covers various times through the summer, only a few kinds are in flower at one time.'

For more than a generation the creed of the 'Pansy King' had been the encouragement of others who would plant and develop native flowers and shrubs. One of the first plants to attract his attention was the black-eyed Susan. Fifteen years ago he decided that this little wayside wench would make an attractive garden flower. After years of training and selection he developed a plant, the blossom of which is four times as large as the black-eyed Susan, but still retaining the gypsy attributes of this wild roadside empress.

The butterfly weed, more commonly known as pleurisy root, was next given horticultural tutelage. Probably it was the history of the flaming orange flower which first brought it to his kindly notice. The Indians, who for years had lived in the vicinity, gathered it, because of its medicinal properties in stopping the flow of blood. Gradually he developed this slender spinster into a strong, healthy individual, from six to eight feet in height, bearing clusters of flowers with a splash of brilliant coloring.



'When given good garden cultivation,' he continued, 'a number of kinds of our wild plants will thrive better than we find them in their native habitat. Even plants seemingly so retiring as the hepatica and the harebell, if given a chance in cultivation, will attain to a size exceeding any we may find in a wild state. Some kinds are more deeply rooted and may need some artificial watering in a prolonged dry spell. Nearly all of them are satisfied with good cultivation.

'I have tried to give to some plants what seemed like natural conditions in a wooded slope where the soil is good and leaf mold abounds, but both species of phlox, Jacob's ladder, hepatica, and others do better in the open with cultivation. The wild Turk's cap lily enjoys a place of its own and prefers cultivation in good soil, although it is mostly found in moist wild meadows.

'Of course, these native plants of various kinds should not be forgotten when not in flower, otherwise weeds will crowd them out. Some kinds show their beauty and make their growth in spring and early summer, dying down to the ground early—their places should be marked. This class includes bloodroot, Dutchman's breeches, green dragon, arum, adder's tongue, spring beauty.

'A convenient time to collect and transplant most of these native flowering plants is when they are in flower, as they can be most easily identified. I have had good success in moving a number of kinds at that stage of growth. Some kinds bear moving best during the short resting spell which follows their season of blooming. This is so with the moccasin flowers or *cyprepideums*, the lilies, and I think the lupines or sundial. I have not had good success with the lupine. The Badger flower, *Anemone pulsatilla*, is impatient of removal in early spring. I shall try it sometime after the seeds are ripened.

'When moving these wild plants, care should be taken to secure plenty of roots which should not at any time become dry. Soil taken with the plants helps to save the roots, but when I know that I can make the roots safe I sometimes shake away the soil for convenience in packing to carry them home. With a stout trowel to dig with, and plenty of paper and baskets for packing, one can make them safe for carrying home—just as safely as plants can be sent a long distance by express. Some kinds can be conveniently raised from seed, as I have done with our native phlox, the cardinal flower, black-eyed Susan, the compass plant and others. With seedlings there is a chance for variation and through selection one can plan for bringing out new varieties. Such opportunities are manifest in the phloxes, Jacob's ladder, the native asters, black-eyed Susan, wild lilies, pleurisy root and others.

Wild pleurisy root was used by the Indians to stop flow of blood but this flower is now cultivated for its beauty.

# Pioneer Tests *in* Aerostatics

AFTER having made, in 1783, a very successful flight some distance out of Paris and return, the balloon shown in the illustration at the left and its operators were greeted by the populace and footmen carrying torches. The fliers' departure was made at the will of the wind, and after 56 minutes had elapsed, they heard the shot of a cannon, signifying their disappearance from observers in Paris.

BALLOON of 1784, which proved its ability to make good speed and rise to considerable height. The wings assisted in the acceleration. Peasants in the fields along the route of the balloonists shouted 'Do not be at all ill! We pray God to preserve you. Farewell, friends!'

IN 1784, the balloon shown below, at an elevation of 400 feet, traveled more than 37 miles in 76 minutes. It was made of brass wire finely rolled out like ordinary cloth, covered with cotton cloth coated with cement. It was 112 feet in diameter and could carry 30 men.

Below—

THE Montgolfier brothers, to the delight of a large French audience, in 1783, conducted experiments for raising a highly ornamental balloon, or 'globe.'

IS it not the chief disgrace in the world not to be a unit, not to be reckoned one character, not to yield that peculiar fruit which each man was created to bear; but to be reckoned in the gross, in the hundred, or the thousand, of the party, the section, to which we belong; and our opinion predicted geographically, as the North, or the South? Not so, brothers and friends — please God, ours shall not be so. We will walk on our own feet; we will work with our own hands; we will speak our own minds. . . . A nation of men will for the first time exist, because each believes himself inspired by the Divine Soul which also inspires all men.

—*Ralph Waldo Emerson.*

## CHRONICLER OF THE NEGLECTED TRUTH

# Make Motoring Safety Your Personal Business

Safe riding in a motor-car is a national problem, and one which should closely concern every woman in the land. Have you, for instance, ever stopped to think what *you* can do to help? Just get this picture—

A crowded, down-town street. You start, you stop, you crawl along. The officer signals for haste and you speed ahead—fearful of bumping into the car in front, afraid of the one behind you . . . Or on the highway—you must stop quickly at crossings; somebody cuts in from a side road—turns are sharp, hills steep and slippery. Such is a picture of everyday problems encountered in modern driving.

Moral—Firestone Gum-Dipped Balloons on your car! Firestone Tires, with their steady hold, their instant response to wheel and brake, their many safety features! . . . The feeling of security which you enjoy with these tires means easier, more healthful riding, free from tension and nerve strain . . . Have the Firestone Dealer call at your convenience. . . . . .

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week has a word of counsel for those who are being graduated from the schools this month.

---

Birth-Control is not a pleasant topic. But Birth-Controllers have carried their propaganda to such extreme lengths, and have so persistently invaded the church, the home, the school, that it is high time for some plain talk on the common-sense side of the question.

---

A Jesuit priest and professor addressed audiences of 6,000 people each on this question of Birth-Control, and here are his lectures boiled down. *It is doubtful if more forceful articles on the subject have ever been written.* Father McClorey does not mince words. He turns the Birth-Controllers' own weapons against them. He attacks the evil not only from the moral but from the political and economic angles. He tears aside their veil of complacency and exposes their doctrine for what it is—Pig-Philosophy. (p. 12)

---

Something seems sadly amiss in Mississippi if one is to judge by grave charges made about the barter and sale of Federal offices there. Affidavits have been sworn; department officials have investigated; Congressmen have demanded action. *And yet the results of the investigations have been kept secret!* Why is this? No administration can weather a scandal by attempting to suppress it. (p. 3)

---

Bill was like Napoleon's army—he fought on a full stomach. But he didn't have a full stomach very often; usually he was pitifully undernourished. It came to pass that in the exuberance of a hearty Christmas dinner—one of the settlement center kind—Bill threw biscuits; and he ended up in juvenile court. There is a close connection between wrong feeding and wrong doing. Luckily Bill met a judge who understood his problem, and remedied it. (p. 8)

---

No one interview can adequately describe Robert Frost. Not that he is subtle or a poseur—far from it. But *one* interview cannot describe Robert Frost *because he is so many men.* Amy Lowell once said, 'He is New England.' But he is more than that: He is America! (And it took England to find it out!) He has so many sides, so many interests—poet philosopher, teacher, farmer! Janet Mabie sketches him on his New England farm. (p. 2)

---

Pretty soon, now, and you will be turning your thoughts to the best school for your boy to enter this fall. Maybe you have been reading the radicals' broadsides against our universities. You wonder if too much stress is placed upon athletics. All right: This is an article for you to read. It is the best analysis of college athletics that has appeared in years. It is written by Thomas Arkle Clark, for nearly twenty years Dean of Men at the University of Illinois. (p. 4)

---

*The teapot is dethroning the porridge pot in Scotland!* Oatmeal—the mother of a frugal and a hardy race—giving way to the fancy cakes and dainty pastry that go with tea! Once they twitted the Scotch about their oatmeal; they said they fed it to horses in England and to men in Scotland. 'Aye,' said a Scot, 'but did ye ever see sic horses as they have in England and sic men as we have in Scotland?' (p. 21)

---

Rigorous deep-thinking domed by a rarified transcendentalism reigned in that New England school of philosophy which met in A. Bronson Alcott's backyard in Concord, and of which Emerson and others were distinguished members. Yet for all his profundity of thought, Alcott's greatest gift to the world was his daughter, Louisa May. Her *Little Women* and *Little Men* are American classics. (p. 16)

---

This week's cover depicts the restful old Alcott home in Concord, one of the literary shrines of the nation. The drawing is by Van der Heyden, whose work has appeared in THE DEARBORN INDEPENDENT before.

---

An expenditure of $90 for telegrams started the ball rolling. Before it stopped, it had bowled over the Coolidge-Butler candidates for Vice-President and had resulted in the election of General Dawes. E. B. Johns tells the story; and he incidentally reveals the sad plight of Senator Butler, the sage who blundered. (p. 6)

---

The Filipinos are clamoring for independence. Do they really want it? Would they know what to do with it, if they got it? Do they understand its dangers and responsibilities? The pasture on the other side of the fence always looks greenest—but it may have hidden thistles. (p. 5)

---

Let's go to a California mining camp tonight! (That's the beauty of reading—we can sit down by the parlor lamp and in a second be sailing the seven seas or flying to the North Pole or chatting with a Tibetan lama.) So here we are off to a mining camp of '49. Which one? Oh . . . why not the Rough and Ready, where Bret Harte got his inspiration? Fine! Let's go! (p. 15)

---

A black cloud in the western sky. It whirls; suddenly it takes a funnel-shaped appearance. Tornado! Scant wonder it terrorizes those who see it. (p. 20)

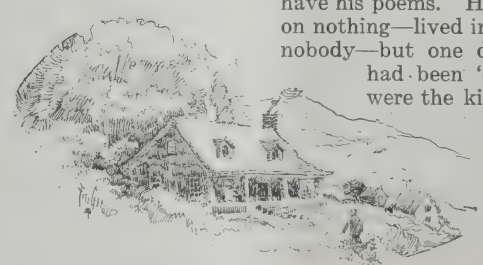
# Robert Frost, Poet of New England

By JANET MABIE



SPENDING an afternoon of flawless lilac and amber riding around the Vermont uplands in an ancient automobile buying farms with Robert Frost is a preposterous, merry adventure to be remembered. To sit with him in his own South Shaftsbury farmhouse, in the light of a single kerosene lamp, until three o'clock in the morning, discussing farming and the Vermont hills, poetic drama and college education by presence, is an experience to be prized.

Amy Lowell once said of Robert Frost: 'He is New England.' To see the man is to see precisely what Miss Lowell meant; for surely no man's features and individuality ever resembled the character and essence of the neighborhood by whose drawing he became illustrious more than Robert Frost's. His face is a curious mingling of ruggedness and delicacy: one feels that it is the sign of strength made kind. The forehead is molded on strong and serious lines. The mouth is both shrewd and gentle, the eyes sharp with a blue that has deepened with unremitting search for the secrets of New England hills and valleys. A poet, but, yes, no fool. His mastery is of more than letters. A mop of iron-gray hair scorns the wearing of a hat. Robert Frost despises dressing up and when he ventures into more urban neighborhoods his manner of wearing his decent black protests it.

This buying of farms is evidently his recreation. He would not drive into North Bennington to meet this correspondent, but would beguile Mrs. Frost, a sweet, gentle lady of soft voice and wise eyes, and an elder daughter to do so.

And later, standing on the doorstep of ancient slate shouting a welcome, would add, 'Hurry—take off your hat—we've time to go and buy some farms before tea.' Wherefore, a slightly rearranged party would set forth in the protesting motor, all but the visitor secretly smiling at the potentialities of the expedition.

But since the curious recreation is the product of a man's passion, cherished from boyhood, for farming, it may be well to examine Mr. Frost's background. Although he is, verily, of New England, he was born in San Francisco, but all his struggles have taken place in New England. He says little of them now, but the memory of them is in his eyes. Mr. Frost's father was born in New Hampshire. Nine generations of his family had lived their lives on New England soil. William Prescott Frost went, in course of time, to teach school in Pennsylvania and there he met and married Belle Moody, who was also a teacher, born in Edinburgh. The couple moved gradually westward and in 1875 Robert Frost was born in San Francisco. The child's father had been a Copperhead in the days of the Civil War and he named his son Robert Lee Frost. In the first decade of the boy's life the events succeeding the gold rush were stirring and the elder Frost had become an editor of a Democratic newspaper. But in 1885 he died and there was nothing to do but for Mrs. Frost to return to Lawrence.

There the boy finished grammar and high school; then when he was seventeen he went away to Dartmouth. But he felt he was not getting what he wanted from it so he left. He tried Harvard, with two years of concentration in Latin. Then at twenty he married. When their first child was born the two were back in Lawrence, but successive ventures in teaching school, making shoes, editing a small weekly paper and a bit of hoboing convinced Grandfather Frost that the boy would never be adept in business, so he finally consented with reluctance to buy him a farm in Derry, New Hampshire.

For five years, although there were no signs of his making it very remunerative, Robert Frost lived in heaven on a farm. He took on kinship with the soil. Its language became his.

In 1905 he became a teacher at Pinkerton Academy. He did not mind it excessively so long as it gave him sufficient freedom for his writing. He had been writing poetry since he was fifteen.

In 1911 and 1912 he was teaching psychology at the New Hampshire State Normal School, and then he made his big decision. He was thirty-seven years of age. He sold his farm, collected all his means together, packed up his family and went to England. His own country had refused to understand him. The magazines would not have his poems. He went to England on nothing—lived in the country—saw nobody—but one day found that he had been 'discovered.' If he were the kind to complain he might say that it were better for folk not to laugh when they quote 'A prophet is

# Are Federal Offices for Sale?

## Congressmen Charge Patronage Was Bartered in Mississippi But Government Fails to Take Action

By MARIAN BRUCE CLARK

SENSATIONAL charges have been made on the floor of the House of Representatives by Representatives Busby, Rankin and Wilson that Federal patronage in the State of Mississippi has been bartered for 'cash in advance,' the charges supported by affidavits from postmasters, postmistresses, candidates for United States marshals and other offices. The amount of money demanded or paid for offices ranged from $200 to $1,500, it is declared, varying according to the importance of the office.

In spite of the charges, no criminal proceedings have been instituted.

Not the least interesting feature is that four women swore they paid $200, $500, $1,000, and $1,200 respectively for their appointments.

As far back as four years ago an investigation was ordered by the Postmaster-General. All reports of inspectors, however, were transmitted direct to Washington instead of going through the usual official channels to the district officials at Chattanooga, Tennessee. The evidence unearthed was submitted to the Department of Justice on November 19, 1924, but its production before the House of Representatives has been effectively blocked by the Republican-controlled judiciary committee.

The situation was described by Representative Busby in a recent speech before the House:

'In my particular state—Mississippi—so corrupt, open, and notorious has been the practice of sale and barter of Federal positions that self-respecting, decent citizens shudder to think of the humiliation into which the state has been dragged.

*Offers Which Were Declined*

'The Republican Party in Mississippi is headed by a negro, Perry W. Howard by name, who is the Republican national committeeman in that state. A negro woman is the Republican national committeewoman. Two half brothers of Howard, S. D. Redmond and A. M. Redmond, together with his law partner, hold the chief places in directing the welfare of that party as well as being the exclusive body through which Federal patronage is dispensed. The national committeeman is located in Washington. He has been given an appointment in the Department of Justice as a special assistant to the Attorney-General, a position paying $5,000 a year.

'In the latter part of 1924 it became apparent that the United States marshal for the southern district of Mississippi would resign. Immediately the half brothers of the national committeeman before mentioned got in touch with some of the leading Republicans of the northern district of Mississippi and proposed to make a deal with them and by this deal *to sell the appointment of United States marshal for an amount ranging around $1,500—"cash in advance."* They proposed this deal not to just one person but to several persons, all of whom were too honorable to lend a hand in perpetrating this infamy on the honor of our government; consequently the offers were respectively declined. To substantiate their authority to make the sale of this office, the relatives of the negro national committeeman exhibited an agreement, as alleged in affidavits, signed by the national committeeman, wherein it was agreed that his half brother should be consulted when appointments were made of United States marshal and United States attorney for Mississippi.

*Failed to Take Any Action*

'The negro national committeeman being an appointee in the Department of Justice, the proposed sale of the United States marshal's office by his gang was laid before the Department of Justice in November, 1924. Affidavits were submitted by persons who were approached to buy this position.

'Two inspectors were appointed by the Department of Justice to make an investigation. They completed the investigation the latter part of May, 1925, and filed their report with full evidence to sustain it, and to sustain the sale of Federal patronage. *The Attorney-General failed to take any action on this report or to make public the report or the evidence.*'

Support for Busby's charges is contained in the affidavit of A. M. Storer, former United States Marshal for the northern district of Mississippi. Mr. Storer declared in part:

'About three p. m., Tuesday, November 4, at my home in Kosciusko, Mississippi, I was called to the long distance phone by one Redmond of Jackson, Mississippi, a half brother of Perry W. Howard. Redmond, after telling me who he was, told me of the resignation of John H. Cook, United States Marshal for the Northern District of Mississippi. He then asked me to come to Jackson that evening to discuss the vacancy in the marshalship. I replied that I could not go to Jackson until Thursday.

'According to the agreement, I went to Jackson on Thursday the sixth, and was met only a few feet from where I got off the train by S. D. Redmond and another negro whom he introduced as his brother, A. M. Redmond. The negroes, instead of leaving the station through the regular entrance, led the way out through the baggage room to the west side of the street. A. M. Redmond then said he would go and get his car and meet us at the office. S. D. Redmond and myself crossed the street to the east side and went a short distance and turned east to Farrish Street. S. D. Redmond then told me to go down the street on the west side and I would see a sign: "Howard, Mhoon & Redmond, Attorneys-at-Law," and for me to go upstairs and he would meet me there. Before leaving me, he said something about Ed Patton and to avoid him. Ed Patton is a negro politician, a henchman of Perry W. Howard, and claims that his recommendation has much weight with Howard. On reaching the sign I went upstairs, turned to the right and asked a person who was passing where Redmond's office was. The party pointed it out to me. I waited in the hall a few minutes and S. D. Redmond came up, opened the office door and we went into the office. In a short while, A. M. Redmond came in and we talked about the election and other things not connected with the matter I had been called there to discuss. Then S. D. Redmond said it was his brother, A. M. Redmond, who had called me over the phone but as I had addressed my letter to him, S. D., he had delivered it to A. M. Redmond. After some little talking, the question of the appointment of a U. S. Marshal for this District was introduced by the Redmonds. Both of the negroes said that I should have the appointment, that I was the most outstanding Republican in the Northern District, and that I should be appointed to the place. I told them that I thought if they would wire Perry W. Howard what they had said to me it would be all that was necessary to land the office; and that I would leave some money to meet that expense. This did not meet with their approval, and they stated it would be necessary to go to Washington on the matter at least once, and possibly twice. I then told them that I was willing to bear the expense of the trip to Washington and upon their return, if I received the appointment, they could send me a statement of their expense, and I would send

*Steps for Landing an Office*

(Continued on page 2.)

# In Defense of College Athletics

## To Show That the Care of the Body Helps the Development of the Mind

By THOMAS ARKLE CLARK

WE HAD very little athletics when I was in college. A few baseball games in the spring and an abortive track meet or two during the year, in which the fellows, without previous training or practice, came out to show what they could do, would tell the whole story; but there was more deviltry practised by the three hundred men registered in college then, and more silly practical jokes played, than by the seven or eight thousand now in attendance. If you don't give a student something physical to do, he's sure to find something. The athlete and the general development of intramural and intercollegiate athletics have been pretty largely responsible for this change in undergraduate activities, and have helped to do away with the horseplay that was extant in our college days.

There never was a time when the athlete and intercollegiate and intramural athletics were so much discussed and so variously estimated as at the present time. There are those who are down on the whole system and who would banish it if they could, and insist that the undergraduate's attention be given more to his books and not to sports; while others, among whom I am numbered, see in the system of athletics and athletic games as we now have them in college, not an unmixed good, possibly, but a helpful influence and an aid to the maintenance of discipline and to the development of character which is far and away a more desirable condition than could be found in colleges forty years ago. Whatever intercollegiate athletics have cost, it has been worth while in helping to unify undergraduate bodies, and in reducing college discipline to the minimum.

Before football and basket ball and golf and water polo and wrestling and all the score or more of sports had worked their way into college activities, the undergraduate who had nothing more serious to weigh upon his mind than his studies gave a great portion of his time and energy to devising tricks, planning escapades and working out schemes of deviltry generally.

In my own college the hazing of freshmen was the chief outdoor sport, and though the work was supposed to be done by sophomores, juniors and seniors lent their presence and their moral support and their applause to the practice by looking on as the defenseless freshmen were tossed into the Boneyard, as the sluggish sewage-infested stream that crept through the campus was called. Half the first semester was taken up with the activities of these night raiders who terrorized first-year students and made night hideous for faculty and townspeople.

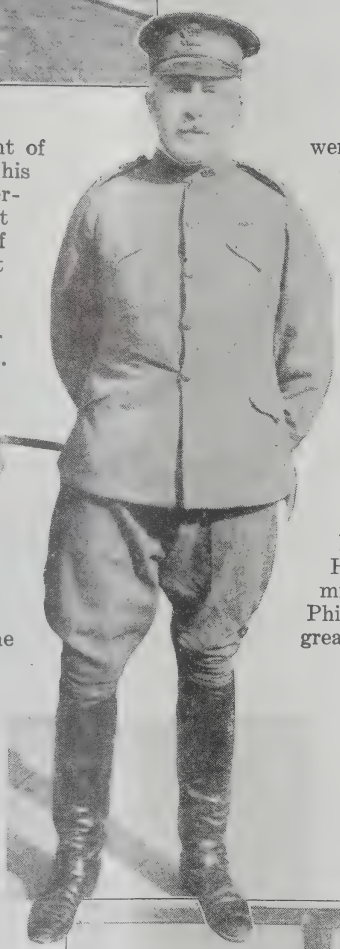
Nothing, unless bolted to the earth, was safe on Hallowe'en. Outhouses, gates and loose sidewalks were torn from their moorings and carried into the next township or burned. The sophomores spent weeks in devising plans to kidnap the freshman president, to break up the junior exhibition, to make the freshman party impossible, to spring some disrupting disturbance at the daily chapel.

One of my most staid and serious-minded colleagues today was dismissed from college for a season in his sophomore year for blowing out the gas at the annual junior exhibition. He had a physique like Goliath and would have made an incomparable guard at football and a world's record, no doubt, at hurling the javelin, but these sports had not come into college life at that time, and he had to express his physical life in some way.

Color rushes and upper-class fights over class trees and bogus class annuals villifying everyone of prominence on the faculty and in the student body were the common things, and are still in institutions where athletics are not generally indulged in and generally encouraged.

With us, as with most other institutions with which I am familiar, the introduction of the main intercollegiate sports and the encouragement of intramural athletics have changed all these conditions. Hazing and Hallowe'en jokes and rowdyism generally are either unknown or rare indeed. College discipline is a much simpler matter than it once was; the general hell-raising which in my day gave the faculty constant attacks of nervous chills, and made the life of a college president a bad dream, is rarely heard of excepting in those back-number institutions whose ad-

(Continued on page 23)



# What of the Filipinos?

## They Say That We Do Not Understand Them

By MARC T. GREENE

THE chief plaint of the Filipino, in his present determined revolt against the suzerainty of the United States, is that the American people do not understand him and that they take little interest in the Philippines. He is 'misunderstood,' he declares, quite in the measure that the Americans themselves were misunderstood in their own struggle for independence. He defines his position as analagous to that of the Colonials in 1775. And he pleads that America do by him what the Colonies would have been done by at that time.

Insofar as his accusation of indifference on the part of the American people is concerned, the Filipino has undoubted ground for dissatisfaction. How much, indeed, do we know about the Philippines? And further, how much do we care? Yet they are our possession and our responsibility, as Kipling reminded us a quarter of a century ago when he wrote *The White Man's Burden*. In many ways we have not evaded that responsibility, as the economic development of the islands proves.

It would be an excellent thing both for the Philippines and for America if we knew a little more about the islands. Physically they are of matchless beauty and economically their worth is beyond computation. If we were to commence now to develop their productive possibilities, for example, along the one line of rubber growing, in six or seven years our rubber bill to England would be cut down hundreds of millions of dollars. And in a decade the Philippines could furnish us with almost if not quite all the rubber our nation needs. Nor is their potential productivity along other lines markedly less. If Hawaii has become a mighty economic asset, the Philippines, approximately as great in area as the whole of New Zealand, have equal possibilities. And they are to all intents and purposes undeveloped, great as has been the progress in the past thirty years.

Except in Manila, life is largely as it was half a century ago or more.

In their possibilities of production of such staples as rubber and sugar the Philippines are of inestimable value to us. And that, also, is an excellent reason why what the Filipino people want is of interest and importance to America. We should know what they want and why they want it, to the end that we may be able to pass intelligently on their demands and that we may no longer be open to their accusation of indifference. Moreover, when we 'took up the white man's burden' in the Philippines we assumed an obligation that was quite as heavy morally as it was politically or economically. That obligation requires us as a nation to interest ourselves in the welfare of the Filipinos as a people and to strive to understand them, whether we decide to yield to their demands or not. But frankness compels the statement that even the Filipinos do not know exactly what they want.

Last February I witnessed the Washington's Birthday celebration in the town where I was staying. My hotel faced the plaza, and from my window I observed the gathering crowds about the speakers' stand, the collection of twenty races, the colorful attire, the amazing blends of eastern peoples and European. The band played and the throng covered the plaza, upon which the sun blazed with tropical fervor. It was a half holiday, and the town took full advantage of it. Everyone was decked in holiday attire; even the children wore hugely uncomfortable shoes.

Was all this, then, a tribute to Washington, a sign of allegiance to the ideals and institutions of America? It was not! It was part and parcel of the agitation for Filipino independence. The day was set apart as a 'day of prayer' and in every native church in the Philippines there (*Concluded on page 25*)

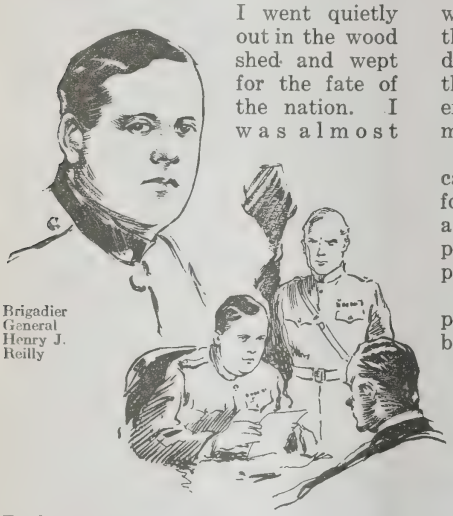
# Ninety-Dollar Vice-President Boom

## One of the Smallest Campaign Funds on Record Brings About the Election of a War Veteran Vice-President



By E. B. JOHNS

DRAWINGS BY W. W. CLARKE

IF a person becomes thoroughly infected with a desire to take part in national affairs he seldom fully recovers. It becomes a chronic affliction. Practically the only known cure is a stinging defeat.

At an early age I was taken with the disease. Before I was of age I was one of the organizers of a Blaine Marching Club. We were the 'Plumed Knights,' and the knights of old in all their glory were not arrayed like one of our club.

My activity in this direction was not mere pastime. I was never more serious in anything, and when Blaine met defeat at the hands of Cleveland I went quietly out in the wood shed and wept for the fate of the nation. I was almost heartbroken, for Blaine was my ideal of a statesman.

Brigadier General Henry J. Reilly

The first overt act in an effort to nominate General Harbord or some other World War veteran took place in my office, when Reilly and Captain H. W. Angus met to discuss the situation.

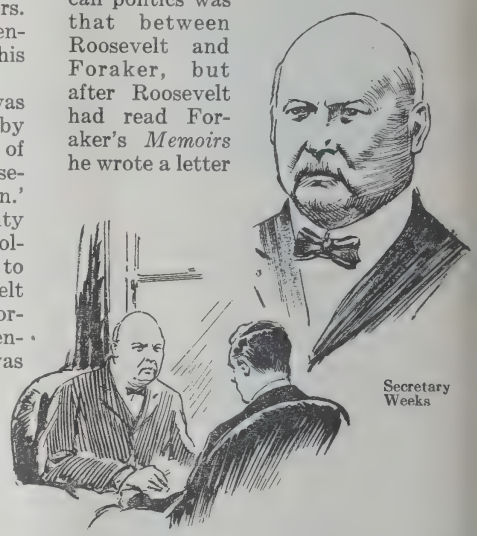
In the 1896 campaign I was a member of the Republican County Central Committee, was confidential adviser to the chairman and prepared all the statements that were given to the press. The Free Silver forces sent an army of curbstone orators throughout the country. The curbstone orator of '96 was carefully coached and trained in all the arguments in favor of the free and unlimited coinage of silver. Until the Republican leaders started a counter attack they were driving the Republicans off the street.

Being fresh from college, where I had studied the money question under the head of political economy, I was drafted into the service by the Republican Central Committee and was soon one of its corps of curbstone orators. That was the last real bitter Presidential Campaign that has occurred in this country.

When I came to Washington I was introduced to President Roosevelt by Senator Joseph B. Foraker as 'one of our boys who fought for your endorsement by the Ohio State Convention.' As a member of the Lucas County Republican Central Committee I followed Senator Foraker in his drive to secure an endorsement of Roosevelt to succeed himself. The regular organization in the state favored the endorsement of Mark Hanna, who was then being boomed for the Republican presidential nomination.

As I recall it, a number of other states had already endorsed Senator Hanna, and it was believed that he controlled the Southern states, but the endorsement of Theodore Roosevelt by the Republican Ohio State Convention effectually stopped a national movement to nominate Hanna.

In reviewing the pre-convention campaign of 1908, Sam Blythe, writing for a popular magazine, said, 'Taft was a Presidential candidate with seven press agents, and E. B. Johns was a press agent with seven candidates.'



I did not undertake to direct the publicity for the opposition to Taft because of any enmity for William Howard Taft, but because I thought that he was not mentally equipped for the office and the leadership of his party. I knew him when he was on the Federal bench in Ohio, and covered the War Department when he was Secretary. He was a splendid judge, but not a success as an executive.

But it is not necessary for me to apologize for opposing Roosevelt when he forced the nomination of Taft. Later I was vindicated by Roosevelt himself. During the war Colonel Roosevelt called me over to New York to discuss some matters in connection with a paper of which I was editor. When I entered his office and he had greeted me in his usual enthusiastic manner, he began by saying, 'Johns, there is something which I have had on my mind for some time and I want to tell it to you before we take up our business. It is this, when you were doing publicity work for those candidates who were known as "The Allies," and I was trying to nominate Taft—'

'Pardon me Colonel,' I interrupted, 'you mean when you nominated Taft.'

'Well, anyhow, you were right and I was wrong!'

There was one thing about Colonel Roosevelt, and that is, when he was convinced he was wrong he would acknowledge it. One of the bitterest feuds in American politics was that between Roosevelt and Foraker, but after Roosevelt had read Foraker's *Memoirs* he wrote a letter to his former political enemy which resulted in their complete reconciliation.

Secretary Weeks

One day, when I was calling on Secretary Weeks, the conversation drifted to the approaching Cleveland convention.

Of course, I could not keep out of the pre-convention campaign of 1920. General Wood was a candidate. Roosevelt and Wood had fought shoulder to shoulder for progressive measures and preparedness. Mrs. Wood charged me with having done more to persuade General Wood to become a candidate than anyone else. I had no official connection with the Wood organization, and was not on its pay roll. My contact was with the General, and I was out of sympathy with the great publicity campaign that was conducted by the management of his affairs. There was not a taint of corruption about it, and it developed at the convention that it was the manager of another candidate who was purchasing delegates.

I sincerely believe that the other candidates spent more money secretly than the Wood managers did publicly. However, the extensive advertising campaign gave the Old Guard in the Senate, which had Harding in mind all the time, an opportunity to lift up its hands in feigned horror at the expenditure of so much money and protest. The strange feature of the situation was that Senator Borah was chief spokesman of the Old Guard in this attack upon the Wood management.

With Wood's defeat at the Chicago Convention, I took another solemn vow never again to take any part whatever in any manner in any movement or party. I went into a period of political mourning. I am still of the opinion that Wood's defeat at the Chicago Convention deprived the country of a second Roosevelt.

But it must be admitted that Coolidge handled with remarkable skill a deplorable condition of affairs that existed when he came to the White House. Among the Republican leaders there was a general understanding that he should be nominated for another term. Further than this, it was recognized that Coolidge should name his running mate. This has been the policy of the party for years. Moreover, no prominent Republicans were seeking the place.

No one dreamed that the Democratic Convention would degenerate into a Donnybrook Fair. When the Democratic Convention met at New York City its leaders were truly optimistic. They had many reasons to believe that they would elect their nominees. After the convention adjourned nothing mattered, as Republican success was assured.

Among the things that worried the Republican leaders was the Coolidge veto of the World War Veterans Adjusted Compensation Bill.

Confidential talks that I had with Republican leaders who were in touch with the sentiment of the country before the convention revealed that they were not nearly so hopeful as their interviews in the daily press would indicate. On account of President Coolidge's views on preparedness, I became interested in his success. It occurred to me that the ticket would be strengthened with some prominent and popular World War veteran with oversea service as his running mate. This would not only overcome to a certain extent Coolidge's veto of the Bonus Bill, but inject more enthusiasm into the campaign.

One day when I was calling on Secretary Weeks to discuss military affairs, the conversation drifted to the approaching Cleveland convention. I told him that I was very much interested in President Coolidge's success on account of his views on national defense. I must admit that I would not have been so greatly interested had I thought there would be so radical a change in his attitude toward preparedness as has taken place since the election. Not only has he reversed himself since his first message, but he has failed to carry out the plain declarations of the Republican platform. The platform upon which he was elected declares:

'There must be no further weakening of our Regular Army. We advocate appropriations sufficient to provide for the training of all members of the National Guard, the Citizens Military Training Camps, the Reserve Officers Training Corps, Officers Reserve Corps, and the reserves who may offer themselves for service.

'We pledge ourselves to round out and maintain the Navy to the full strength provided the United States by the letter and spirit of the Limitations of Armament Conference.'

The President now makes no pretense of carrying out this platform pledge.

But returning to the conversation with Secretary Weeks, I urged him to suggest to the President that he select some prominent World War veteran. Mr. Weeks said that he did not believe that the President would accept a man simply because he had been in the service.

I had been going over prominent veterans in my mind and mentioned General James G. Harbord, who shortly before that time had resigned as Deputy Chief of Staff of the Army to become the president of the Radio Corporation of America. Mr. Weeks expressed the opinion that a better selection could not be made if General Harbord would sacrifice his business to accept.

That night I went over the whole situation and the more I thought of it the more convinced I became that the country was ready to recognize the services of the veterans of the World War as it had those of the Civil and Spanish-American wars.

Next morning my coat was off and I started a quiet campaign of interviewing those prominent leaders of the party with whom I was personally acquainted.

I had some business with Senator Wadsworth, of New York, chairman of the Senate Military Affairs Committee. At the conclusion of my interview I brought up the question of the second place on the national ticket, mentioning General Harbord. The Senator said, 'Of course, this is a matter entirely for the President, but if I were he I should select General Harbord or some other veteran of that type.'

I talked with Senator David Reed, of Pennsylvania, a World War veteran, with distinguished service, Representative Royal Johnson, and most of the members of the veterans' bloc in the House.

When I went to file the telegrams, the man at the desk said, 'Ninety-two dollars and thirty-six cents.'

Senator Borah

He reiterated his previous declaration that he did not want the nomination and *would not* accept it.

All admitted that General Harbord would make a strong candidate, but insisted that the selection of a candidate for Vice-President was a matter for the President to decide. Some of them told me in the strictest confidence that Senator Butler, who was then recognized as the 'political spokesman' for Coolidge, had indicated that veterans need not apply.

I expressed my doubts then as to whether this was really the attitude of the President. I did not believe that a candidate would be disqualified on account of his World War service, although I am now inclined to this view.

The first overt act in an effort to nominate General Harbord or some other World War veteran took place in my office when, at my request, Brigadier General Henry J. Reilly, now war correspondent in China, and Captain H. W. Angus, a reserve officer of New York, met with me to discuss the situation. Both were warm personal friends of General Harbord and became interested in the movement. Up to this time the only communication I had ever had from General Harbord on the subject was a letter of thanks after the convention. I did not doubt he would respond to the call if by any chance he were nominated.

After talking the matter over, Reilly, Angus and myself decided to send out night letter telegrams to the service men who had been elected delegates and to certain Republican leaders who we thought could be interested in the cause. An interview by General Reilly was carried by the Press Associations the following day.

As we estimated it, the telegrams would cost ninety dollars and the campaign fund was raised on the spot, by equal contributions from the three conspirators. When I went to file the telegrams, the man at the desk said, 'Ninety-two dollars and thirty-six cents.'

Captain Angus, on account of professional engagements, was compelled to drop out of the picture, and Captain C. Forrest Curry, Jr., of the Reserve Air Force, of California, was enlisted in the cause.

Chartering a drawing-room in the Press Special from Washington to Cleveland, General Reilly, Captain Curry and I moved the headquarters of the Harbord boom to Cleveland. The headquarters consisted of a box of paper, carbons and a typewriter. During the trip to Cleveland we prepared sketches of Harbord's *(Continued on page 22)*

# What Dieting Did for Bill

## Nourishment Knocks the Naughtiness Out of Redhead, Now a Social Asset

By JUDGE HENRY NEIL

ILLUSTRATED BY W. W. CLARKE

THE Juvenile Court was celebrating Christmas according to custom—that is, on the day after.

December 26 was always one of the busiest days of the year in that court. Amid the aftermath of this particular Christmas, the case of Bill interested me most. Bill and his gang had certainly celebrated Christmas Day in glorious fashion, according to their lights.

I've seen numerous charity Christmas parties in settlement houses. Earnest young social workers slave over the preparations. They supplement the turkey with basketfuls of dainty lettuce sandwiches. The tables, decorated and set with some pretense of nicety, are laden with appetizing food. The room is gay with fragile Christmas ornaments. Pretty little baskets of candy hang on the tree. A cheery program of parlor games is planned.

But when the doors are thrown open an unruly mob rushes in. The place is stormed. Amid noise and scuffling, dirty hands grab right and left for food and candy and presents. Shouts and wails rupture the Yuletide peace. Joe Carboni seizes three baskets of candy, and takes another away from Tiny Tim Flaherty, who is too little to fight back but subsides in wild sobs. The Christmas program is valiantly carried on above a volcanic seething of unrest.

The welfare workers are on the verge of desperation, but the youngsters are having a grand time in the only way they know how. Respect for dainty food and pretty ceremonies has not been part of the training of the children of the slums. What they want is a riot.

Bill was undoubtedly responsible, as charged, for the Christmas riot at the Owens Settlement House. The welfare workers' testimony showed that it was he who started the famous celery battle. The long tables had been decorated with fancy jugs containing fluffy bunches of celery. Bill and his street gang thought the celery was something funny. They had never eaten any celery, and perhaps had never seen it before. They grabbed the stalks and began to use them like whisk brooms to dust each others' faces. Then Bill hurled a bunch at his arch enemy who was making faces at him from the other side of the room. Instantly a dozen boys were throwing celery.

The floor was a slippery mess before the bell rang for the boys to sit down. Then they spied the pumpkin pies that had been placed in lavish quantity all along the tables. They began wading into the pies before the minister could start to say grace. Bill, with his own mouth full of pie, shoved a big wedge into his neighbor's mouth.

'Have some mud pie,' he urged.

'Quit it, you big simp,' yelled one of the boys across the table. 'Those are for after the turkey.'

'Shut up, you big mutt,' Bill replied, 'or I'll lam you one in the eye.' He picked up a pie as if to throw it, but the boy on his right knocked it out of his grasp. Bill grabbed it again and mashed it in the offender's face.

'Pie face, pie face, see the muddy pie face,' he chanted. The boys took up the chorus and began throwing the pies at each other. Undoubtedly they had been educated at the movies.

This isn't a nice Christmas story at all. But then, these boys weren't nice boys. They were lawless, irresponsible rowdies. Even well-trained boys will go on a tear when the mob spirit sways them. College boys from fine homes have been known to turn their own fraternity house dining room into something like a pigsty, in the course of an exuberant celebration. People smile tolerantly at that and call it a lark. But when the same spirit crops out in a gang of street urchins, who have been utterly neglected and raised on the pavements, people frown heavily. When Bill did it, they arrested him.

Bill had had his prestige as neighborhood gang leader to keep up. He was Alexander and Napoleon. He became completely intoxicated and carried off by that sincerest form of flattery which was heaped upon him by the other boys who imitated his every exploit in disorder. The welfare (Concluded on page 26)

Bill heard the hated leader of a rival gang calling him a 'red-headed monkey.' Bill grabbed a dish of cranberry sauce and rubbed it in his enemy's hair.

# MR. FORD'S PAGE

WITH the regularity of nature in its production of crops, the process of education goes on. Someone is always beginning, someone is always completing, a course of training. At this season of the year when birds are being graduated from the nest, and when seeds become blades and blades ears, there is also a great exodus from the schools of a multitude of youth who are to make their way in the world. They are the graduates, as we call them: some are coming from the grade schools, and will not go on; some are coming from the high schools, and will not go on; some are coming from the universities, and will not go on. And many are stopping at points between—at the sixth grade, halfway through high school, at the end of the second college year—with no graduation excitement but with not a whit less advantage in life.

Everyone wishes he could say that graduation insures success in life, that education insures it, that having faithfully completed years of study one has therefore earned, as a sort of diploma, success in life. But no one can say that. The facts are against it. The theory that education puts one abreast of his times so that he may start without a heavy handicap, or that it develops his powers so that he may start with some knowledge of his capabilities, is very good. Often, however, it occurs that these advantages and discoveries are the fruit of post-student years, which only goes to show that education, or experience, is not an exclusively collegiate matter at all, but the principal vocation of life.

This is the most fortunate time of all known times for a young man or woman to start life. But it does not differ from other times in the need for a rudder. Indeed, perhaps the current of life now runs so much faster, and the charted routes are now so numerous, that rudders were never more necessary than today.

Vital drive and judgment are the indispensable equipment for the times.

Vital drive is a gift of nature, but even a slight spark of it can be nursed into a flame. We have not as much of it in America as we think we have. We confuse the amount we are doing with the amount our machines are doing. Our vital drive threatens to diminish as a result. There is no power on earth to be compared with the vital power of the individual human being, and that we must keep and nourish under all conditions.

*DRAW a line from the eye to the mouth. That is the line of action which most people follow. They talk about what they see, not knowing that what they see is only part of what is there; the eye sees surfaces, but the mind sees values. Now, draw a line from the eye to the back of the head—that is, through the brain; then draw a line from the brain to the mouth. That is the line of wisdom and judgment. Bid the eye refer its report to the mind, the mouth be silent until thought is completed. That is the full formula for making a man of judgment. Judgment is the habit of referring all matter from the outside world to the laboratory of your mind for analysis.*

Judgment is a gift, but it may also be an acquisition. In most of us it is the latter. We too often say, 'He has no judgment,' when what we really mean is, 'He has no habit of judgment.' Nobody has any judgment until he exercises it. Judgment is not something that acts of its own volition, as the eyelash winks when an object threatens the eye—judgment must be summoned, called in, set up. It is a habit of procedure. And many people have not the habit.

Maybe that can be best illustrated by a figure. Draw a line from the eye to the mouth. You have there the line of action followed by most people. What they see they immediately talk about; —but that is not the worst of it, *what they see is not all that is there.* 'Things are not what they seem,' as Longfellow said. There is a great deal said about visual education, but it always has existed and always has been the system used on the thoughtless. All the fakes and fallacies in the world go through on the eye-to-mouth line.

Now draw a line from the eye to the back of the head, and from the back of the head to the mouth. There you have the line of judgment. And few there be that follow it. Follow that simple course as a habit—making the brain a part of the triangle, making it the connecting point between seeing and doing—and you set up judgment.

What you see you do not see at all until you have passed it through your mind for analysis and valuation. Bid the eye refer the matter to the mind, and bid the mouth be still until thought has been completed, and not only will your speech be wiser, but your action also, because you have added the ingredient of judgment.

This counsel is offered to the graduate in faith as to its value—draw a line from your eye to your brain; let the line to the mouth come from the brain, not from the eye. The things you see with the eye are part illusion. The things you see with the inner understanding are near the truth. Everybody is imposed on by appearance except those who brush aside appearance and look for the reality which may be behind it. The judgment hall, the mental laboratory, is set up within every one of us; it is merely a question of using it. Many an adulterated thing, many an artificial make-believe, that seems all right at first sight, will reveal its true character on the line that is drawn from the eye to the mind, and as a result the action with reference to it will be wise and true.

## The Council and the Churches

THE Federal Council of Churches is precipitating a situation which may compel identification of that body with its real allies and purposes. It assumes to be the agent and spokesman of the Protestant Churches of the United States. This assumption is being questioned on every hand within the churches and is made increasingly doubtful by the wide difference which exists between Church opinion and Federal Council pronouncements. In matters of most serious character the Federal Council has urged an alien, anti-Christian and anti-American propaganda upon the Churches. To prevent any possible misunderstanding of that statement, it is repeated that the Federal Council of Churches, instead of being the mouthpiece of the Protestant Churches of the United States, is the mouthpiece of movements which seek to secure by deception the countenance and support of those Churches. This is a serious charge, but not so serious as the Federal Council's alliances and methods. The Churches of America do not know to what they are being committed by the Federal Council, and will be the first to repudiate it when they find out.

The Federal Council's rôle as agent to win the American Churches to movements which grow up outside the Churches, and to purposes which the churches never conceived or formulated, is evident again in its recent discussion of 'compulsory military training,' whatever that may mean. The echoes of the Council's prohibition report have hardly died before this new move is made. Wisely, however, the Federal Council this time does not assume to speak *for* the Churches, but speaks *to* them, and *asks* the Churches to study the question of military training. The Federal Council is evidently committed to the monstrous doctrine that citizenship may exist without responsibility and that it is criminal to teach in the schools the principles of patriotism and the preservation of American liberties. The American Churches never instructed the Federal Council to take that position, and will not permit the Federal Council to commit them to it.

By all means let the American Churches study the question put to them by the Federal Council, and study it in literature and facts other than those submitted by the Council, and having done that let them proceed a step further and study the connections and activities of the Federal Council of Churches.

There is a place for a Federal Council which shall inform the nation *what the Churches think*. There is no place for a Council that assumes *to tell the churches what to think*.

## Individual Work

ALL really great achievements in the world's history have come from the inspiration of an individual. Organizations have been useful only in carrying out individual visions.

Neither time nor money nor mathematics has ever created anything. The world moves step by step through the inspiration of one human soul or another which gives its life to make a mere dream come true.

This may be the vision of a new school of ethics in the Sermon on the Mount, or a picture from the steaming of a teakettle which visioned a power-driven world—it might be the vision of man on wheels or wings driven by that very fire which was once his chief enemy and the basis of his Fear-religion.

In each case, however, the world was changed, revised, bettered, reorganized, and all from the leaven of one individual enthusiasm which affected the whole loaf—the ferment of unrest in one driven soul which germinated to force tremendous growth.

Organization is a machine for the carrying on of work, but work itself is still created by the soul and religion of the individual.

## A Letter

'THE other day my attention was called to a screen picture titled "What Happened to Jones," in which "Reginald Denny" is the leading actor. My commentator bitterly arraigned the company producing the film for the flippant use, in low comedy, of a protracted scene in church in which the comedian was dressed in the full vestments of the church and in which he parodied the sacred office which a bishop fills.

'In order to be sure of my ground I attended a performance of the aforesaid and found that the criticism was amply justified.

'I have the best of reasons for asserting in confidence that my statement cannot be disproved that no moving picture producer would dare parody any Catholic bishop or priest, or any Jewish rabbi, in the way in which they have consistently and constantly parodied ministers of the Protestant gospel; and particu-

larly undignified, offensive and contemptuous is this parody of an Episcopal bishop; for in this film Denny, for the purpose of his buffoonery, first garbs himself in the habiliments-in-ordinary of an Episcopal bishop and then, at a wedding service, in which the wedding procession and the interior of the church are pictured, with Denny finally in the habiliments of an officiating clergyman at a wedding ceremony, with the Bible in his hand, making a caricature of the service, etc., etc.

'Because one never sees either Catholic or Jew parodied in this way on the screen, one is amply justified in assuming that that which one frequently sees in moving pictures is a demonstration of a subtle purpose, namely, to hold the Protestant minister of all kinds in contempt and derision.'

## *French Farmer and Taxes*

SIXTY-TWO per cent of the national wealth of France, distinct from that of the government, is agricultural wealth. This wealth contributes eleven per cent to the total taxation bill of the nation. This resolves itself into a virtual indemnity for agriculture, a policy which the French Government has adopted as a means of perpetuating the nation and preventing the farms from becoming depopulated. The peasant is the backbone of France. When the nation in time of stress has needed men and money it has been the peasant who supplied them. He has kept the nation alive.

It is significant to note that after years of this system of taxation probably the only really prosperous group of France today is the farmer who comprises fifty per cent of the population.

Diana Bourbon, writing in the New York *Times* following an extended visit to French farms, says: 'To a Frenchman of note I remarked that if France would tax her agricultural wealth with some degree of adequacy and then concentrate on collecting from her other citizens the taxes they already owe, instead of trying to pass new laws which they will avoid in turn, there would be no financial problem.

'His reply was that I was probably right. "But after all, why should we? England is heavily taxed, and the English pay their taxes. What is the result? The government is rich and the people are poor. We French do not pay our taxes, with the result that the people are rich and the government poor! Which is better?"'

---

The party, President or Candidate that sidesteps is sooner or later sidestepped. Prohibition may command party approval or disapproval: one or the other attitude must be taken: there is no possible neutrality.

## *Defeated One by One*

THE significance of the Senatorial primaries is not that better men are replacing the regular candidates who have been defeated. In some instances distinctly less capable and less desirable men have been selected by the electorate. The significance of these reversals is to be found in the profound distrust which the people feel of the present trend of our government. The latest overturn in Iowa emphasizes all that has gone before. The break has become a run and the run threatens to become a political panic in which the destruction of political regularity cannot be escaped. The explanation is that the men in power persistently refuse to take counsel of the people of the United States. To take only one instance: without consulting the people, and in opposition to the unorganized expression of popular opinion, the administration committed the nation to the foreign policy involved in the World Court. Since that time four Senators who favored the World Court have been defeated. But that is only one thing.

The whole political outlook is completely changed from what it was a year ago. This preference of one candidate over another is not the whole story. If certain administration policies were put upon popular vote, they would be repudiated also. But the people have not that option as yet. They can only register their protest; they cannot yet register their will. The complaint goes deeper than dissatisfaction with individuals; it consists in a deep disappointment that all the fair promises of consideration of the popular will have been buried beneath the rule of cliques which seem to have no conception of what the people of the United States are thinking.

## *The Lesson of the Woodpile*

THE woodpile is symbolic. It stands for duty and responsibility, for a definite task, to be accomplished without quibble or shirking. A New York man bemoans the passing of the woodpile from city life; to him it is a symbol for *work*. He is right. City life begets much leisure for boys, and leisure improperly utilized begets mischief.

The country lad with certain specified tasks to perform each day has a big advantage over the city-bred youth. With his chores he stores up resolve and energy and determination for later life. In manhood he will have *the will to do things*, the grit to finish what he begins. With the city lad things may be and often are quite different. Much of his work is done for him. He has few duties, few responsibilities. He must devise means for filling in this leisure time—with play. The boy who subsists solely on play is cheated.

ONE of the big Lenten events in Detroit every year is the series of addresses given in the largest public auditorium by Rev. John A. McClorey, Jesuit priest and professor at the University of Detroit. Each address is given three times to accommodate the multitudes who throng to hear. Father McClorey tackles subjects which are not, as a rule, popular, and his frankness is often breath-taking. But the impression made is very profound and the positions defended are true. We are glad to present in somewhat abbreviated form, but entirely in his own language, the substance of Father McClorey's two lectures on Birth Control. The second lecture will follow in a succeeding issue. Seldom has the subject received such searching treatment as in these lectures.

# The Futility of Birth-Control

## Prominent Ecclesiastic Exposes Neo-Malthusian Fallacies; Advocates Improving the Living Conditions of the People

By REV. JOHN A. McCLOREY

I APOLOGIZE for speaking of Birth-Control. For, though of late it has become quite respectable, buttressed by plausible arguments, defended by some Near-Intellectuals, practised by large numbers of the exclusive, gilt-edged set, given a hearing by newspapers and magazines, and weighed judicially by many who before shunned the very thought of it; nevertheless Birth-Control is nothing more than a dirty piece of sexuality, bald lust, stark brutishness, what Carlyle would call Pig-Philosophy, which disrobes men and women of the spiritual atmosphere in which religion, poetry, and chivalry have arrayed them and shows them forth as mere animals, male and female; emphasizing with the insistence of pornographic degeneracy the unveiled passionateness of sex.

Such things, says St. Paul, should not even be mentioned among Christians. I would that Birth-Controllers had not dragged their moist and slimy Caliban from the fetid caverns of their minds into the light of day, for the inspection of decent people. Why do not degenerates practise their abominations in secret on the silken couch of decadent luxury and be satisfied? But no, like dope-fiends, they feel the itch of an unholy apostolate and must infect the multitude with their unnatural debauchery. And so it becomes a man (as it would have become St. Paul) to speak of them, in a modest but plain way, to preserve the uninitiated from lechery.

*Malthus Opposed Artificial Birth-Control*

Birth-Control is a moral as well as a biological and medical matter. I am competent to judge of its morality.

Birth-Control is a misnomer. The thing should be called Birth-Frustration or, better still, Contraception.

Malthus, an English Minister of Religion, published his essay on 'The Principle of Population' in 1798. The essay was directed against the Socialists Condorcet and Godwin who held that poverty and misery were due to human institutions and for this reason could be remedied by Socialism. Malthus, on the contrary, taught that poverty and misery are due to overpopulation. For whereas, in his opinion, population increases in geometric proportion, 1, 2, 4, 8, 16, 32, etc., the supplies of life grow only in arithmetical proportion, 1, 2, 3, 4, 5, etc. Hence in due time the supplies of earth will be inadequate for the needs of men. Accordingly, he says, people should not marry or marry late and then practise much self-restraint. Malthus was opposed to artificial Birth-Control.

*Catholic Church Stands Against It*

The Neo-Malthusians or Birth-Controllers hold that the only means of checking population is artificial Birth-Control. As a matter of historical fact, Birth-Control has been identified with Atheism. Charles Bradlaugh and Annie Besant gave Birth-Control its first noticeable impulse in 1876. They were arrested for their propaganda. Before their time, Doctor Drisdale, a man of the same ilk, wrote his book on the subject. Doctor Dunlop, himself a Birth-Controller, admits the identification of Birth-Control with Atheism. Havelock Ellis, Doctor Dawson, the present King of England's physician, and in this country Mrs. Sanger are other names identified with the movement. H. G. Wells has written an introduction to Mrs. Sanger's latest book. The lady enumerates Bernard Shaw among Birth-Controllers. The fact is, Bernard Shaw said he was in favor of Birth-Control of a kind—Birth-Control through self-control. He added that he was opposed to any system which implied the impossibility of sexual abstention. Birth-Controllers are trying to appropriate the cloak of religion for their nefarious enterprise. But their efforts have been in vain. The Council of Anglican Bishops, held at Lambeth a few years past, condemned the thing. Dean Inge does not represent the Anglican Church. Charles Bradlaugh's advocacy of Birth-Control in 1876 was denounced from every Protestant pulpit in England. The Jewish Rabbis as a body, I believe, are against the artificial limitation of families; and of course there is no hope for the Neo-Malthusians in the attitude of the Catholic Church.

Some individual Catholics no doubt indulge in Birth-Control to some extent. But they know they are doing wrong. They either confess the sin and try to amend, or remain obstinate in their wickedness and thereby lose membership in the Church. The case of France is often quoted against us. But Frenchmen have fallen away from the Church in great numbers during the last century; and statistics show that where Catholicity is a living force in France there is no Birth-Control. Also statistics prove that in those localities of England and America where Catholics are more numerous, the birth rate is high and vice versa for the other places. Indeed, Professor Myrick Booth, a Protestant scientific student of the matter, and many other men of the same sort praise the Catholic Church for her successful stand against Birth-Control and warn Protestants that by the force of Catholic unimpeded fecundity, in due time Catholics will supplant them everywhere unless they avoid the Neo-Malthusian contamination.

*Neo-Malthusian Virtue in Reality Vice*

Birth-Controllers hold that poverty, disease, a high death rate, famine, war and vice are widespread in the world; that these harrowing conditions must be removed; since they are caused by overpopulation, overpopulation must be reduced, and the only way of doing that is their system of Birth-Control.

Against them, I hold that artificial Birth-Control (1), is not necessary for their purpose; (2), is not sufficient for it; (3), is evil in itself; and (4), is evil on account of its effects. The last two points will be developed in another article. The first two will engage us now.

The general proposition: 'Birth-Control is not necessary for their purpose' may be conveniently divided into these four assertions: (1) Birth-Control is not necessary to reduce excessive population. (2) The reduction

of excessive population is not necessary for the abolition of poverty and misery. (3) The removal of poverty and misery is not necessary for virtue and morality. (4) Neo-Malthusian virtue and morality are, in reality, forms of vice.

Birth-Control is not a necessary means toward the reduction of excessive population because *population is not now and is not likely ever to become excessive;* also, if this were the case, Birth-Control would not be necessary to reduce it. There are other means.

***Overpopulation of World Still in Future***

Some sixty per cent of the land of the United States is not under cultivation. There are vast tracts of idle country in Canada, Australia, South America and Africa. Congestion exists in large cities, but men, not God nor Nature, are responsible for that. *The Malthusian theory of population and supplies is now discredited among most philosophers.* THE WORLD WOULD HAVE BEEN OVERPOPULATED CENTURIES AGO IF THE CONTENTIONS OF MALTHUS WERE TRUE; especially if the race of men were as old as Evolutionists would have it.

Malthus prophesied in 1798 that in 1898, England and Wales would be burdened with 112,000,000 people. As a matter of fact, the number of men and women in those countries at that time was only 32,000,000; and it is a mere assumption to say that this discrepancy in numbers has been due to Birth-Control which made no noticeable gains until 1876. In the United States, despite the vast immigration of prolific races of the last century, we fall short by 13,000,000 of the number of people Malthus said we should have.

As to food, Mr. Wanders in *America* calculates that even without new, possible methods of cultivation, the world could support 200,000,000,000 men and women, about 120 times its present number. The United States could sustain 600,000,000; and as we are only some 125,000,000 at present, we need not fear starvation yet awhile.

But even if population were excessive either in reality or in prospect, Birth-Control would not be necessary to reduce it; there are other means. Birth-Controllers never even mention continence as a means.

***Living Conditions Should Be Improved***

There is strong evidence from experimental observation that an increase in prosperity, comfort and intellectuality in a community of men and women (without Birth-Control and the debilitating influence of sinful luxury) lessens their fertility. If therefore a population needs reducing, improve the living conditions of the people.

A high death rate lessens population. This seems a cruel thing to say. But preventing babies from coming into life is as cruel as letting men and women and children go out of life. It is more cruel. The latter only have their life curtailed; the formerly are utterly deprived of it. And it is better to have lived a while and died, even with the accompaniment of suffering, than not to have lived at all.

Then there are the great counteractants to excessive population, supplied by nature and man: famines, plagues and wars. History proves that such agencies have always prevented excessive population on the earth. Unless Neo-Malthusians can establish that no more wars, plagues, and famines, earthquakes, storms and accidents will occur, they cannot propose Birth-Control as a necessary corrective for immoderate fertility. Possibly in the next war, gases will poison whole cities instantaneously. In the Middle Ages, the Black Plague destroyed one-fourth of Europe's inhabitants; and though medical science has done much to reduce sickness, we in our day have encountered a deadly plague, with the harmless name of 'Flu.' Cancer seems to defy surgical skill. Devastating Pneumonia and Tuberculosis give no signs of abating. Possibly worse diseases are in store for us. If so, then overpopulation (if it exists) will have been a blessing.

In the second place, reduction of population is not needed to ameliorate the acute economic condition of the world. The reason is simple and profound: overpopulation does not cause misery. The reverse is true: misery causes overpopulation. Do not, therefore, reduce population to lessen misery but lessen misery to reduce population; if such reduction is desirable.

***Prolificness Not to Blame for Poverty***

Thomas Doubleday came to the above conclusions after many experiments; and Mr. Pell, who resurrected Doubleday's theory, and Doctor Halliday G. Sutherland, the most redoubtable opponent of Birth-Control in England today, are of his opinion. According to the doctrine of these learned men, when the race is in danger of diminution or extinction through hardship and poverty, nature automatically meets the danger by greater fertility. Contrariwise when the race, amid comforts and healthy surroundings, is safe from the likelihood of diminution or extinction, nature moderates her output of children.

The true cases of misery and poverty are the violence of nature in the form of plagues, famines, earthquakes, floods and storms; and the sins of men. Why blame prolific parents for the distresses of the poor when we have under our eyes catastrophes of nature; the injustice of many of the rich, poor wages, excessive work; and sloth, lack of economy, lavish expenditure and intemperance prevalent among great numbers of the poor?

Thirdly, the distresses of the poor are not nearly so lurid as they are painted by Birth-Controllers and the replacement of them by prosperity and comfort is not necessary to insure virtue and morality.

There is much happiness among the very poor. Just as behind the beauty and luxury of palatial walls often enough black grief sits enthroned, so inversely, back of the squalor of the destitute there is quite commonly a fund of cheerfulness. Their sins are more open than those of the rich, cruder and not disguised by culture; but not so many nor so vile as the sins of the silken set. Physically they are as strong as the run of the pampered and effeminate rich and from their loins have sprung as many men and women of genius as from families of wealth. While comfort and prosperity ought to make us better men and women they quite generally have a deleterious effect. Hardship with its austere discipline is the maker of men. God Himself taught us this; and lest we should think Him a heartless and detached Teacher of morality, He became the Man of Sorrows and Poverty. God forbid that I should not wish and do my best to alleviate the miserable. But it is wrong to suppose that destitution has no redeeming qualities and to make a fetish of plenty and ease.

***When Virtue Becomes Like Vice***

Fourthly, the virtue and morality of Birth-Controllers are in reality forms of vice, as we shall establish in our next article. Therefore, even if Birth-Control, reduction of population and amelioration of the economic conditions of the world were necessary means to their style of virtue and morality, yet these means would not be desirable because the end at which they are aimed is not desirable.

It would appear then that Birth-Control is not necessary for the high purposes of life.

Neither is it sufficient for them. Birth-Control is not a sufficient means to better the material condition of the poor, to improve the procreation and education of children, to reduce the death rate and to abolish plague, famine and war.

***More Machinery More Workingmen***

Birth-Controllers say: Lessen the number of consumers and there will be more supplies for each of them. This is plausible but not true. *For if you lessen the number of consumers, you thereby lessen the number of producers of supplies;* by the debilitating vice of contraception *you lessen their capacity to produce supplies;* by reducing the number of workers, thereby increasing the demand for their work, *you lessen their incentive to industry;* on account of the shrinkage of the proletariat through Birth-Control *you lessen their power to prevent selfish monopolists from cornering supplies;* and you facilitate the reversion of an overpaid, underworking labor class to their former condition of destitution and misery through lavish expenditure and

intemperance. H. G. Wells says that great numbers of workingmen are not needed in a world of machinery. But history shows that when machinery spreads, the demand for individual workingmen increases. Extra men are needed for the building of machines; and for the new markets and new commercial enterprises which are the offspring of mechanical industry.

*One Way of Increasing Cost of Living*

Birth-Controllers say: Lessen the number of wage-earners and you thereby increase the wages of each of them. This also is plausible but not true. For if you lessen the number of wage-earners so as to increase wages, you increase the cost of living; you give occasion to employers to flood the labor market with imported cheap workers; and by swelling the pay-envelope at their expense you tempt them strongly to withdraw productive capital from the field of industry and to stop exploiting the resources of nature; a result which would harm the working class as well as capitalists and the community at large.

Birth-Controllers say that if there are fewer children there will be better children. But why will children be better if they are fewer? If a human mother bore many children simultaneously, tha is, at one birth, then *possibly* her offspring would be better, the fewer she bore; because in that case she would have to divide her procreative force among many children and consequently lessen the energy communicated to each. I say 'possibly,' because a beast bears many young at a birth and it is not apparent that each of them is less healthy than it would be if there were only one. But as a matter of fact a human mother produces her young successively, thus being able to give to each of them, taken singly, the best that is in her. Now that 'best' does not diminish with use during the period of fertility, but after each birth is restored to its original forcefulness. For a mother is not like a reservoir whose water level is lowered by draining; but like a fountainhead which is replenished while it gives. Indeed, her fruitfulness seems to improve with time and use. For there is much evidence to show that generally the later-born children of a family are the most representative. Napoleon, Ignatius of Loyola, John Wesley and Abraham Lincoln are a few examples of men of genius who were at or near the tail-end of their families. Through artificial Birth-Control, the family and nation are deprived of the best scions of the race. Birth-Controllers say: Give us quality, not quantity. But quality is obtained only through quantity and numbers. Birth-Controllers imagine that comfort and prosperity improve the quality of mothers. But the paraphernalia of a life of ease is not more conducive to healthy parents and offspring than an environment of distress; and if poor mothers are weakened by hardship, privation and child-bearing, Malthusian mothers are hurt more gravely by contraceptives.

*Fewer Children Does Not Mean Efficiency*

Neither will Birth-Control better the education of the children. Within limits, the more a normal mother is required to do, the more she will be able to do. Capacity for work grows with working. If she has seven children, she will be capable of educating seven; if one, she will possess only enough energy for one. Hence the Neo-Malthusian theory: 'Have fewer children that you may train them better,' is false. Besides, in a small family, there is lacking the wholesome training of domestic democracy. And where there are only one or two children in a family, death, taking the one or two, breaks up the family; the home is still and chill; the great motive for living slips away from parents; and in due time, childless old age, with its wrinkles and white hairs, comes to empty hearts. If childlessness is not the fault of parents, God makes up to them for the defect. But if parents have themselves to blame, how can they expect the sunshine of heaven to warm and brighten their sear and yellow leaf?

*Where Births Are High Deaths Are Low*

So it appears that contraception will not result in the ideal family which Utopian Neo-Malthusians like to portray.

Birth-Control will not lower the death rate. Reliable statistics from France, England, Wales and Ireland show convincingly that where the birth-rate is high in these countries, the death-rate is low; where the birth-rate is low, the death-rate is high. *A priori* speculation would lead one to think that it ought to be the other way. But observation proves the case to be as I stated it.

In view of these reflections, it appears that Birth-Control is neither necessary nor sufficient for the betterance of the race. It is a 'dud'; a blank cartridge, sounding loud but not striking home to the mind with the impact of conviction. Consign it, therefore, to the ash-heap of burned-out theories.

*FOURTEEN thousand documents comprising the official headquarters correspondence of the Commander-in-Chief of the British forces during the American Revolution have been brought to America.*

## Our Musical Judgments

ROBERT A. SIMON is skeptical as to the ability of us Americans to appreciate music for music's sake. He claims the better-known musicians have reached their eminence not always through ability in a musical way but due to the 'legends' which surround them and which are played up by enterprising press agents. Writing in *The Bookman*, Simon says:

*Paderewski a Great Musician*

'Our musical judgments, if any, are formed chiefly on matters that have little to do with music. Let us look into the case of Paderewski, who can draw huge audiences at prices which compare only with those charged for singularly costly Broadway revues. Paderewski, considered merely as an artist, is a great musician, somewhat, but not vitally, impaired technically, and a pianist who infuses interest into everything that he plays. These considerations do not account for his popularity. Paderewski is a tremendous box-office attraction because of the Paderewski legends. Almost every successful public performer has at least one legend, but Paderewski rejoices in a succession of them. When he first came to this country, several decades ago, the tale that his wife had died from starvation, coupled with his "leonine mane," made him an attraction that everyone had to see—and, incidentally, hear. His genuine musical merits saved him from the saner critics and the others became press agents for the "Polish lion."

'Then there was de Pachmann, who also attracted Chopin devotees, but who would have drawn many crowded houses if he had played nothing more interesting than a sequence of the scales. Like Paderewski, de Pachmann had established himself as a musician of fine attainments early in his career, but his performances, at least in recent years, were not to be taken into account. De Pachmann was something to see—and, this time not incidentally, to hear. But it was not de Pachmann's piano playing that received attention; it was his habit of supplementing his performance with a continuous flow of prattle and with odd gestures and curious ways of getting on and off the stage. His American manager went so far as to raise the price of front row seats, an unusual procedure in a concert hall. De Pachmann's diction wasn't so good, and those who wanted to hear every word of his irrelevant gabble were willing to pay a premium.'

*De Pachmann's Diction Not So Good*

Hydraulic mining—wearing down the gold-bearing soil of a hillside.

# Rough & Ready's Legacy to California

## An Old Mining Camp of the Forty-Niners Which Inspired Bret Harte

By JOHN T. FARIS

THE news of the discovery of gold at Sutter's Mill in California led to one of the most remarkable movements of population in the history of America. 'Five years before the famous gold rush of 1849, there were not 500 Americans in California,' one student of the movement has said. Yet 'four years after the gold rush the population of the state was 300,000, and in the interval the argonaut had become one of the heroic figures of history. In a short period this figure had succeeded in having the center of population westward more than eighty miles.'

Across the plains, around Cape Horn, over the Isthmus of Panama the treasure-seekers hurried, and they penetrated to 'every gulch, ravine, basin, canyon, flat, bar and bench in the mountain country.' Men who, at home, had been sedate leaders, honored by their fellows, who never dreamed of appearing in public in anything but immaculate clothing, suddenly found themselves boon companions of laboring men, and men without education. The lust for gold was common to all of them, and this made them ready to endure hardness together, to forego every luxury, and to suffer untold privation in the search of the treasure that sometimes eluded them, but more often, in the early days, rewarded their efforts.

***How Prosperity Came to the Camp***

Quickly the gold country, which for centuries had known only the rare Indian hunter, was dotted thick with mining camps. Some of these were doomed to failure after a few days or weeks, while others persisted for months or years. Some, like Placerville (the old Hangtown of the pioneers), have become permanent; there both the business streets and some of the residence streets of that attractive town perpetuate the miners' paths that wound among or over the hills.

Of the camps that have disappeared, leaving no mark, one of the most famous was Rough and Ready, begun in 1849 by a company from Shellsburg, Wisconsin, which, after crossing the mountains by the Truckee route, paused on the banks of the Yuba River, in what is now Nevada County, close to the modern town of Grass Valley. The new camp took its name from the company, which from the days of its departure from Wisconsin, had called itself 'Rough and Ready,' because its captain had served under General Taylor in the Winnebago War.

Later, while hunting grizzlies and deer, a man in the company stooped to drink of the water in the ravine below Randolph Flat. As he did so he found a piece of gold. Prosperity followed, and the camp was soon removed to its new location, and two cabins were built.

The ten men in the original company were followed by a second company from Missouri, whose members, after a time of conflict, agreed with them that the two parties would monopolize the rich diggings in the vicinity of the camp.

The Randolph Company, as the Missourians called themselves, built two cabins at the head of the Flat, and went to work industriously. It soon became apparent that the rich diggings called for more workmen, so the leader of the Rough and Ready Company went East to secure forty men as helpers. These eagerly responded to his offer of a year's work for the same wages they would have received for such work at home, their traveling expenses, and their food. But during his absence miners came to Rough and Ready in a rush. Of course, they refused to recognize the monopoly, and, by September, 1850, five hundred of them were taking out the gold from the rich sand and quartz of the gulch.

There has been preserved the diary of a miner who, in March, 1852, visited Rough and Ready:

'I found a lively camp. The diggings have been very rich all around it, and they have found on the ridge, near Randolph Flat, claims that have paid big. A peculiarity is the number of rich pockets that have been struck. A miner named Axtell uncovered one, two weeks ago, from which he has taken out fourteen thousand dollars, and there have been any number that yielded from five hundred to five thousand dollars. There are miners who follow pocket mining exclusively, and there certainly is a fascination about it. They will work for weeks without making grub, and then come across a pocket from which they will take out hundreds or thousands . . . There is a place below Nevada City that is like Rough and Ready in the way of deposits. I am told that they find the gold there in little clay streaks and when they discover one it is sure to be rich. It is a peculiar sort of gold . . . .

***Bret Harte Brought It Fame***

Rough and Ready's greatest fame came to it through Bret Harte, who gave standing in literature to the mining camps of the Sierras, including Rough and Ready, which he seemed to regard with peculiar affection.

A social evening at 'Apple-Slump,' home of the Alcotts.

# THE ALCOTTS— As I Knew Them

By JULIAN HAWTHORNE

ILLUSTRATED BY W. O. FITZGERALD

TO BARBARIANS—as the Athenians used to call the people outside—Amos Bronson Alcott appears a solitary figure, a 'sport' of our spiritual nature, or a man born two thousand years too late. His voice cried in a wilderness in a pathetic manner, except for his own confidence in his rightness and the truth of his message, which gave him peace and complacency amid the surrounding wreck of matter and the war of worlds. He was content, one might say, to preach to himself; for even when his chosen circle was about him, he soon lost consciousness of them, and with eyes beholding only the infinite, and a faint air and aspect of inward satisfaction, he would enunciate his wisdom in a voice without inflections and without charm. He would say things which sounded preposterous and incredible with the same assurance as if he had but declared black to be white.

Most of us couldn't help smiling covertly to ourselves as we gave ear, though there were persons, women chiefly, who swallowed it all unquestioning, not so much because they understood it as because it was Mr. Alcott who said it. He knew it all from the beginning; his hearers could not hope to trace his argument, if he had one, back to its source; but they had a sublime faith, which had power to remove the mountain of his incredibility.

If anyone disagreed with him, it indicated only a lack of comprehension; nobody denies truth if they see it. Alcott, being a seer, did not feel that his office was to explain; he lifted the veil from the face of Isis, and if you saw nothing, it was not his fault. Imaginative acolytes might convince themselves that the awful countenance of the unknown was actually visible, merely because Alcott so constantly thought and affirmed that it was; there is much power in reiteration. Besides, did he not accept and unite with Plato, Swedenborg, Origen, and all the rest of that shining company? And who ventured to contend against them? As Emerson said, 'the astonished muse finds thousands at her side,' without, perhaps, their knowing just how they got there.

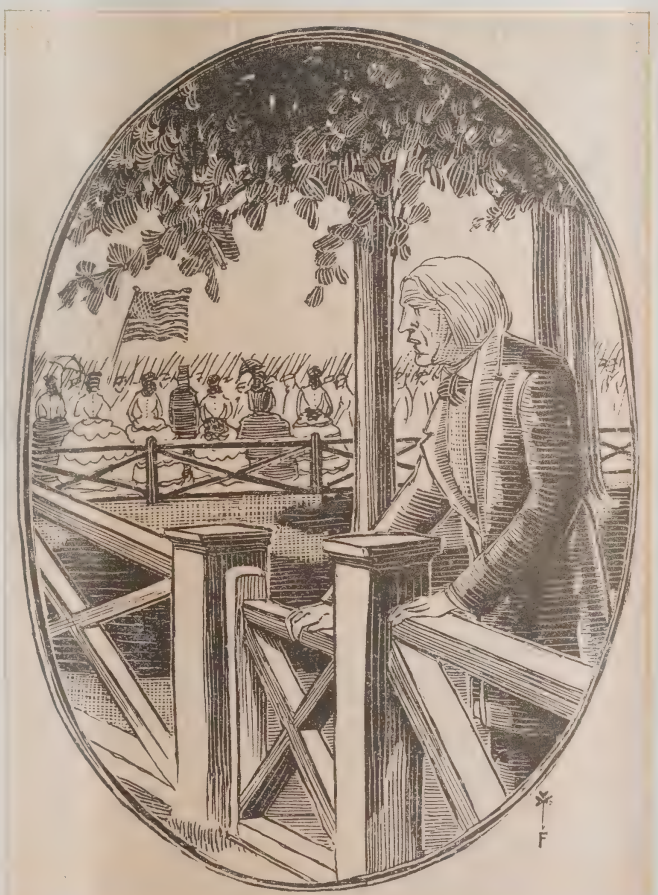
Without mention of Emerson, Alcott might never have been able to become visible, or audible. If we regard Alcott as the cow that jumped over the moon, Emerson's was the hand that let down the bars of the pasture. Emerson was the sun or central star of our transcendental system, and the light that came from him authenticated the planets which it irradiated. In contemporary phrase, he O.K'd Alcott, and that sufficed for us, who could never hope to do more than stand on our earth, and gaze up admiringly at the galaxy above us. The galaxy was somehow there, and we could only say, like the country folk at the fireworks coruscating overhead, 'Ah-h-h!'

I don't know that Alcott ever admitted deriving anything from Emerson, but Emerson would declare that he got much from Alcott, though he was never more enigmatic than when he set out to explain how and what. Our homely, domestic faculty of reason, if lifted to a certain height, becomes something else, and sounds sibylline and orphic. Emerson, on some such orphic basis, accorded Alcott reverence, and what were we to do less? Perhaps Alcott, by being more unattainable than Emerson, caused the latter to appear less unsubstantial; all things are recognized by contrast with others. Because we grinned at Alcott, we took Emerson seriously.

At any rate, it was remarkable that little old Concord, dreaming beside its

sluggish river, amid its lowly meadows, and fully satisfied with the fame of its fight at the bridge, should become the home of such persons as Emerson, Alcott, Hawthorne, Thoreau and Channing. Boston, to be sure, was only twenty miles away, if you could believe the surveyors; but spiritually, the Pleiades were not more distant. Boston was the home of the Unitarians, of the Abolitionists, and of Come-outers generally, as well as of the Beacon Hill aristocracy; and Holmes dubbed it the Hub of the Universe; at least it stood still, relatively speaking, while the circumference moved. It had the quaintest way of saying, with eyebrows elevated but charitable, 'Oh, yes—Emerson!' If Alcott's name were introduced, Boston would murmur 'Oh . . .?' with a mildly interrogative inflection, as if awaiting further information, though not eager for it. No, Alcott distinctly did not 'belong,' any more than Barnum would, though raised to the celestial degree.

But Emerson was at home in all companies, and in conversation with emperors and kings would make them aware, courteously, that they were no better forked-radishes than the rest of us. He had the social gift, but Alcott was a crude prophet, as raw as the uncooked carrots and turnips on which it was his pleasure to subsist. He was too innocent and unworldly wise for compromise, and yet with an invincible mildness—the gentle but incorrigible obstinacy of a sheep. His countenance, with its mildly blinking eyes, reminded one of a sheep, long, narrow, harmless, obstinate. Of course he was very much more than a sheep; a piece of divinity was lodged in that long, lean, shuffling, awkward body; in his odd fashion he was the superior of other men.



Nature had built him of incongruous elements: the animal so strong in him that he ought by all likelihood to have been a mere animal; but to the animal was harnessed an angel. There may not have been any conflict between them; we know little of his early youth; he had been a Connecticut peddler before he tried to keep a school on a new principle. Perhaps the angel was dominant from the first, but was nevertheless doomed to drag the dull, stupid, insensible creature along with him. Alcott never had the air of a reformed rake, or of reformed anything: he did not change, grow, or remold himself; he was Alcott once and for all. He talked continually—he called it conversing—but the tenor of his utterances was always the same. His jewels were strung upon a thread of intuition; but he supplemented these spontaneous insights by the reading of congenial books and by confirmations—they would be confirmations rather than learnings—from experience.

The Latin proverb laments that the ancients said all our good things before we did; but it is possible that Alcott believed he had at least thought them first, and that the Platos and Swedenborgs had merely put the same general idea in their own words; they were supporters of his views, therefore, but hardly originators of them. They came to him from the infinite, and he was debtor to nobody. If not first in time, he was independent as discoverer.

One of his most fortunate discoveries was of the young lady who became his wife—a daughter of Samuel May, known as a philanthropist, and more one than many meriting that title. But she was a jewel, and the strength of her nature appears in her accepting such a man as Alcott was in 1830 as her husband, for whatever culture he may be said to have acquired postdated his marriage, and was due, no doubt, less to Plato or to Emerson than to her. He had been born—his father was a small farmer known as Alcox—in 1799, and was a mere naked idealist, moneyless and incapable of earning money. As he went on living till he was nearly ninety years old, and never became a money-getter, he must have been helped along somehow, and, like Leigh Hunt, held that a gift of cash or means was at least as good for the giver as for the receiver: a man must pay something even for raw water and vegetables.

His wife took care of him and bore him three or four children, all girls.

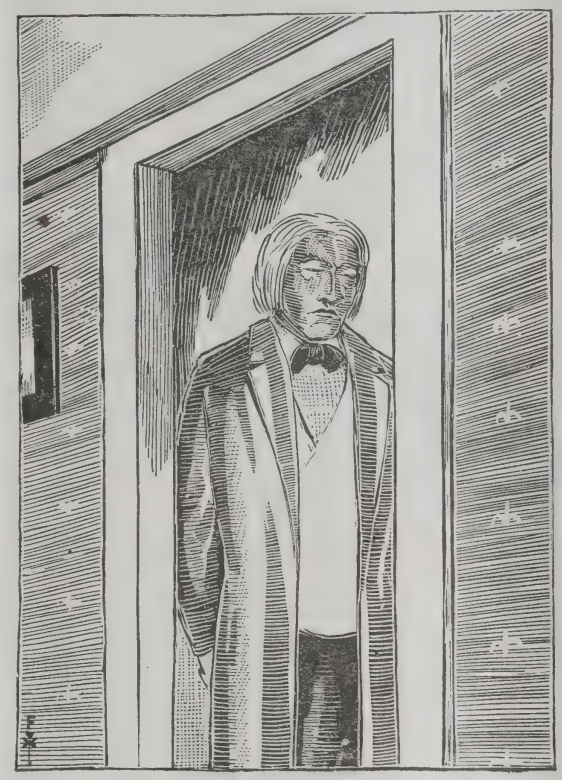
The girls were all good housekeepers, though Abby, the second or the third, had art aspirations which were partially satisfied late in her life when she found a good husband. Ann also married, and she and her husband, known to us as 'John,' were model people. Of the fourth I know nothing and, in spite of Louisa's *Little Women*, am inclined to doubt her existence outside of Louisa's imagination; but I am open to argument.

He crowned himself with a brighter laurel when he let Louisa go to the front in the Civil War to nurse the wounded.

When I first came to know the family in Concord, in 1860, it consisted of father, mother and the three girls, of whom Ann, though of the neighborhood, lived most of the time in her own home, but always responding to emergency calls. All these people lived poor, but were rich in happiness and harmony; the father survived all except Louisa, who died, I think, two days after he did. My last glimpse of him was a year or so before his death, when he looked just as he had twenty years before, and in much better outward trim; that is, he was less the opposite of spruce in attire, and in countenance and voice was at least as good as ever. Moreover he had at that time written a little volume of sonnets, addressed to his many friends, living and dead, and the sonnets were not at all abstruse, but were simple and not ungraceful appreciations of their good qualities.

Here was a man whose concern for his personal welfare failed by at least ninety-nine per cent to equal that of his efforts for the spiritual welfare of his fellow men; who carried out that program during the whole of his career, and died respected by all and reverenced by many. He was too impersonal in his attitude toward others, and might have been capable, like Agamemnon, of sacrificing his own flesh and blood on the altar of principle. Happily, principle demanded

no such extravagance of him. Be that as it may, everybody liked him, and those who knew him felt affection for him; his goodness and good intentions were sterling. In the whirlwind of things in general, he was the heart of peace; his yardstick for measuring the importance of things was eternity.



During the Civil War, he mended his rustic fences and put up his deciduous little arbors and summerhouses; and in the intervals of these activities, he sat in the room called his study, with edifying books on the shelves and paper and ink on the table before him; and *The Dial* used to print his things as long as it existed, and after that *The Atlantic Monthly* occasionally surrendered a few pages to his lucubrations, not without paying for them according to their temporal value—but they were written for immortality. He never doubted his gospel and never deviated from it; but one would like to know what was his spiritual condition previous, say, to his twenty-first year. It would be encouraging to know that there was, at some juncture, a pitched battle between him and Apollyon, certain as we are that if such a thing happened, the foul fiend was worsted and got no quarter. But no rumor of such a thing has come down to us, and probably Apollyon had sense enough to keep out of the sage's way.

It was after his marriage that he came to Concord, drawn thither, like others, by Emerson's fame; and at first he occupied a little cottage on the Boston highway which he afterward extended and improved. Alcott had added a gable or a wing here and there, and had erected two summerhouses made of boughs which he had selected and cut in the woods on the little hill in the rear of the dwelling. In these, and in his fences, he showed a felicity of design, graceful and delicate, which was untaught and therefore suggestive of something refined in his nature; but the local carpenters used to say that Mr. Alcott used more nails to accomplish a given result than did any other builder within human memory; and the domestic expense for kegs of nails must have far exceeded that for anything else in the domestic economy; but Mrs. Alcott paid the bills in silence and smiling; it was her husband's sole extravagance and committed unconsciously.

On my way to and from school in 1860 and after, I used to see him, in his white linen suit, with his long white hair falling on his shoulders, hammering diligently and happily at the fence and the gate which inclosed his domain; the house itself didn't require his ministrations; it was even then an ancient New England dwelling, with a long, sloping roof and dormer windows and a big chimney; in front of it stood two enormous trees, one a butternut, the other I think an elm; a lawn intervened between them and the fence. The house is still standing, and looks to be in excellent repair; in fact it is now made a sort of museum of Alcott relics, but I never had the heart to enter it; that door had been the entrance to and sally port from so many unforgettable joyful occasions in my boyhood.

Larks and nightingales may be stuffed and mounted on a perch after their song-life is over, and other pretty creatures may be preserved in alcohol and kept in bottles with labels. But formless dust is a better sequel to death than any our ingenuity has found; it gives love and memory a better chance to perpetuate what we loved in our hearts.

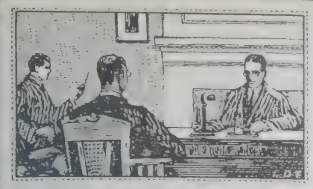
As the Alcott house and the Wayside were not a two-minute walk apart from each other, the Alcott family and ours were soon on terms of intimacy. Their house was unquestionably the more picturesque of the two; it was not perhaps the older, but it had never been renovated; whereas the Wayside had proved too small for our accommodation, and Mr. Wetherbee and Mr. Watts, the two local carpenters and builders, had been requisitioned to make enlargements and additions; they did their best, and it was honest and sound work, but it was a sort of sacrilege.

Occasionally there would be a moment's glimpse of a lank figure with long white hair passing an open door.

Louisa Alcott's name for their house was Apple-Slump: apple-slump is a dish made of apples and pastry, which I can describe no further than to say that it is a sort of pandowdy, which perhaps does but deepen the mystery. But the aspect of the house suggested a slump, and the title was accepted as felicitous. No doubt it bears a more dignified appellation today, and the slump has been corrected. At all events it was, sixty years ago, the abode of joy and hospitality, in which of course Mrs. Alcott and the girls were protagonists, though somehow Mr. Alcott participated, if only as a benevolent background.

Entering the hallway, a door on the right admitted the visitors to a large, low-ceiled room, which opened at the rear into the kitchen. In the left wall of the sitting room was a wide fireplace, the scene of many a jolly gathering; there was a piano in the corner opposite, with Abby seated at it, playing waltzes, polkas and sentimental song music; there were chairs in plenty, and a large table in the midst, where suppers were served after the games and songs were over.

We also used the table for card games—long-whist, euchre, old-maid, casino—and the cheating that was done at that table would have made a professional gambler blush. It was disgraceful, as Mrs. Alcott often declared; but what does a young fellow with a nice girl-partner care for disgrace? Besides, Mrs. Alcott sometimes cheated a little herself. Finally the card game would break up and Abby would go to the piano, and we danced and danced, and sang and sang, and then somebody would take Abby's place, and we would sing and dance again. Or sometimes the lights would be lowered, and we sat round the fireplace telling the most excruciating ghost stories, Louisa of course always foremost in these impromptus. All this was before she wrote her immortal book, but we knew she was a genius long before the public did.



What part did Mr. Alcott play in these diversions? It seemed enough to know that he was close by, in the study across the hall, closeted there with the muse. Occasionally, however, there would be a moment's glimpse of a lank figure with long white hair passing an open doorway, an unobtrusive phantom of philosophy escaping into the shadows. Once, though, we lassoed him and brought him in bodily; and thereby hangs a tale.

I have told it before, but lest the record be mislaid, I shall tell it once more. We were all seated around the table for supper, and Mrs. Alcott had just brought in the apple and pumpkin pies and the bottles of homemade spruce-beer. She had gone back to the kitchen again for something else—something very rare and special, she had said: and at that moment the sage was seen attempting to vanish up-stage. Louisa called to him authoritatively, and he halted and wavered. Abby leaped upon him and brought him in and we compelled him into a chair. There he sat, blinking blandly upon us all, and murmuring that he was in the midst of something in the study.

'We're going to have supper, and you must join us,' Louisa said; 'you shall have a tomato if you wish, and I picked some good baldwins this morning. Nobody ought to work on an empty stomach!'

He submitted mildly, and began to talk about the true relations between diet and the spirit, and while he was thus engaged, his wife came in with the promised rarity on a platter, covered with pink tissue paper. My sister Una, sitting nearest it, peeped underneath, and her eyes expanded. Mr. Alcott had become rapt away from earthly things in the diet theme, and Una, in whom abode a vein of mischief, cut off a piece from the rarity—it was nothing less than a hunk of bride's-cake, sent by some friend whose daughter had just been married—and laid it on the sage's plate. He had probably never before seen bride's-cake, and supposed that this (if he looked at all) was a bit of brown bread; at any rate he broke off a morsel and put it into his mouth, not interrupting the flow of his discourse. It was the best brown bread he had ever tasted, and while we all watched breathless, he masti-

# CHATS WITH OFFICE CALLERS

'Well, I see that Professor Kemmerer is off to Poland again,' said ***the Man from Washington.*** 'Apparently his last visit—of a week—was not sufficient to ally Poland with the Gold Standard Empire which is taking the whole world under its jurisdiction. Let's see—it was last Christmas holidays that Kemmerer went over there last time, wasn't it? I remember a Polish statesman then remarking that the professor was making it a "week-end job."

'But what puzzles me is that the Polish Revolution does not bother Kemmerer at all. The Gold Standard has right of way through all wars. Here is Poland all cut up over political changes, yet the Polish legation at Washington calmly announces that it will make no difference to Kemmerer. Here are the exact words: "The recent events in Poland which led to a change of government did not in any way affect the plans for this mission."

'What does that mean, I wonder? Kemmerer goes to Poland in the winter holidays. He comes hurriedly back. Is it possible that the visit of this Gold Standard Wizard was not acceptable at that time? Was there some hitch which could be straightened out only by a revolution? In any event we know that the revolution did come; Pilsudski did march on the capital and send the Government fleeing; the Jewish Telegraph Agency in the United States did announce that the revolution was very agreeable to the Jews; and Kemmerer goes back to Poland with the official announcement that revolutions mean nothing to his plan—thoroughfare has been provided for him regardless. It is rather strange.'

'Who hires Kemmerer to do this?' I asked.

'I don't know.'

'Has no statement ever been made as to what individual, group or power is thus organizing the world?'

'None that I know of.'

'Has anyone ever attempted to get the facts?'

'Yes, but as I understand, without success.'

'It seems rather strange that this super-financial agent of somebody should be able to string all the countries of the world together like beads on a string, and nobody know about it, doesn't it? Consider the wide advertising given the Dawes Plan and the little that is known of the Kemmerer missions—seems strange, doesn't it?'

'It does—to both your questions.'

'What's the answer?'

'That is for someone to discover.'

ɤ ɤ ɤ

'We hear a lot about the Younger Generation these days,' said ***the Poet-Philosopher*** as we sat around the table after dinner. 'I believe in their freshness and their enthusiasm, but they are not going to take the world in hand and reorganize our governments for us and abolish war and all that kind of thing—as some folks tell us. That's silly. A lot of our prominent speakers and educators dwell almost exclusively on the wonders the Younger Generation are going to perform. They tell us of the great things that will come to pass as soon as our boys and girls get control of things. They laud the youngsters to the skies—to their faces—and as a result a lot of them get all puffed up with fancied importance. It's hardly fair, because it's such a shock when they leave college and come in contact with the harsh realities of the world. The Younger Generation is no better and no worse than the younger generations of bygone days. They do not come to us with a new revelation, but they do bring with them something we sincerely appreciate—a fresh enthusiasm in tackling the old problems. But I have no great hopes for their super-ability. How do they differ from the older people in this respect? People used to talk the same bunk about us when *we* were the Younger Generation.'

ɤ ɤ ɤ

***The Man from the Country*** was detailing some of his experiences:

'In developing a certain piece of property,' said he, 'the owners had to build a highway the length of the tract along a lake shore. This called for considerable grading and preliminary work with man and team, as the terrain was extremely rugged. A farmer was found plowing his steep and barren hillsides. He was taken down into the timber and the need explained. Then came the question of price. He scratched his chin meditatively and said:

'"It's this way boys. I'll have to get my potatoes in for the season is late. Now this here work will take me two days at the best. Comin' in the busy season this way I'll have to charge you fellows three dollars a day for myself and team. I hate to do it, but that's my price."

'Six dollars for work that in any industrial city would cost at least fifty dollars. This same man made a price of eleven cents a pound on a chicken he sold his employers. He was given forty-five cents a pound instead. Another man in the same township worked ten hours a day helping to build a cottage on the lake shore. His price was one dollar and a half a day. This within 200 miles of a high-wage area. When told that the cottage he was helping to build would rent for twenty-five dollars a week he seemed astounded. He did not realize that city folk craved the peace and quiet of his lake and woodland as a tonic. The people of this vicinity live cheaply yet with comfort. Their needs are few. They are well clothed and well fed. They are a God-fearing people with no artificial craving for what to them would be luxuries. The sun shines, the crops grow, the fish bite in the evening. Life holds much happiness for the folk in the back country, whether it be in the fastnesses of the Ozarks, the Olympic Mountains of Washington or the northern part of the Lake states. They enjoy living. They work and meet in harmony. Although their lives may seem monotonous to those who consider themselves more fortunate, they possess a calmness of mind that will last them throughout a long life.'

***The Naturalist,*** usually a serene individual, seemed to be somewhat annoyed over the very general ignorance of people, even the intelligentsia, regarding many of the interpretations of nature. He had recently met a man who very indignantly denied being an animal. This fellow was a butcher, too, and should have had some appreciation of anatomy and the physiological processes. Recently a legislator in a southern state had warmly insisted that all textbooks that class man as an animal should be relegated to the dump heap.

There seemed to be a woeful ignorance regarding the three great kingdoms, or divisions of created things. In its 'Question Box' a certain popular journal had made reply that the bat is an animal and not a bird. But the proper explanation would have been that all things not vegetable nor mineral are animal. The distinctions are and should be recognized as much finer; they are easily defined within classes, orders and families. And common names, as well as those that are necessarily technical, are too often misapplied; as witness the leading nature magazine labeling the photograph of a regal moth the 'imperial' and calling a water bug 'a water beetle.'

The distinction between bugs that possess only proboscides and beetles that are endowed with jaws is as marked as that between house flies and yellowjackets, butterflies and dragonflies, trout and suckers, shrews and mice. Ask the average college professor to give an example of an insect and he is as likely to mention a spider or a centipede as any six-legged creature with a distinct head, thorax and abdomen.

ɤ ɤ ɤ

'I have a very dear Pacifist Friend,' said ***the Professor,*** 'who is perfectly horrified, when she is not scornful, that the United States Government still recognizes such archaic things as guns and cartridges. There is no figure of speech too strong for her to apply in derogation of her own country. She wants to disarm us all at once and banish the formula of arms-making from the American mind. But she approves the Russian Army. Oh, how she regards that army! It is the army of Liberty, she says. She was over in Russia not long ago, and she illustrated to me how the Soviet soldiers swing down the streets, and she sang some of the songs they sing—songs of hate against the Western World, songs of vengeance against America and Britain. She rendered them with great spirit. Strangely enough, her inconsistency never seems to have dawned on her. You can lead her directly from disarmament for America to admiration for the military establishment of the Soviets, and it doesn't seem to strike her that she is inconsistent.

'Of course, all Pacifists have not that double attitude, but all Pacifists play into the hands of those who have that double attitude—disarm your own country, but arm its enemies. That is the danger of the Pacifist. He becomes a tool in the hands of those who know exactly *why* they wish to see the United States disarmed.'

# In the Sickening Track Of the Terrible Tornado

## Some Weird Freaks of the Most Dreaded of All Storms

By S. D. FLORA

TORNADOES, the most violent kind of storm known to America, are liable to occur anywhere from the desert regions of Arizona to eastern states like New Jersey and Maryland, according to official records of the Weather Bureau, and they constitute a real though somewhat rare menace to life and property which will increase as the country becomes more thickly settled. The South is by no means immune from them, while Minnesota, Illinois, and Ohio have suffered some appalling disasters from them in recent years.

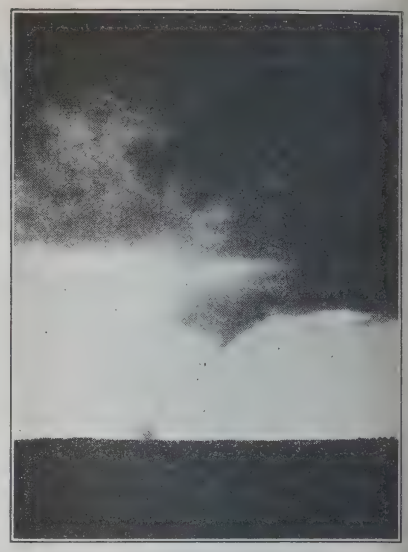
A black cloud in the western sky which suddenly sets up a whirling motion and develops a funnel-shaped tail that begins to bore earthward, a roar 'like that of a thousand railroad trains crossing a trestle,' and then an almost irresistible twisting wind that explodes frame buildings like egg shells and fills the air with a barrage of timbers and debris—and the monster has passed on, leaving a sickening path of death and destruction in its wake.

A church that exploded and collapsed when a tornado cloud passed near it. The pressure of the air is almost a ton to the square foot, and when the air outside of a building is suddenly removed by the suction effect of a tornado cloud the inside acts with the explosive effect of powder.

It is not surprising that these are the most dreaded of all storms that strike inland, or that 'cyclone cellars' are still recognized places of refuge.

It used to be popularly assumed that cyclones were indigenous to the plains region, and Kansas especially, but Government statistics, gathered over a long period of years, show the 'Kansas cyclone' has received much undue publicity.

The *Monthly Weather Review*, an official publication of the United States Weather Bureau, contained an article a few years ago giving the location of all known tornadoes in the country over a sixteen year period, and these show that when relative areas are considered, Illinois had ten per cent more tornadoes than Kansas, and New Jersey nine per cent more, while Maryland and Massachusetts were more infested by these destructive storms than Missouri and Iowa



In the five-year period ending with 1922, the latest for which published reports are available, there were 445 tornadoes reported to the Weather Bureau. These took a toll of 1,437 human lives and resulted in property damage of $45,422,300. The greatest loss of life and the most extensive destruction of property occurred in the more thickly settled states of the Middle West.

Illinois headed the list with a total damage of more than seven million dollars, while Minnesota came second with five million dollars and Indiana third with four million dollars.

Strangely enough, several southern states suffered the greatest loss of life. In Mississippi 178 persons were killed, in Arkansas 135, and in Alabama 134. The more sparsely settled western states fared better. Kansas escaped with a loss of but 61 lives, Iowa with 29, and in Nebraska only four persons were killed by these storms in the five-year period.

The Lorain, Ohio, storm, which held the attention of the entire nation, killed 83 persons and damaged property to the extent of thirteen million dollars. All this damage was wrought in a few minutes and almost with no warning. Such disasters are possible in dozens of other states if the paths of these storms chance to cross cities.

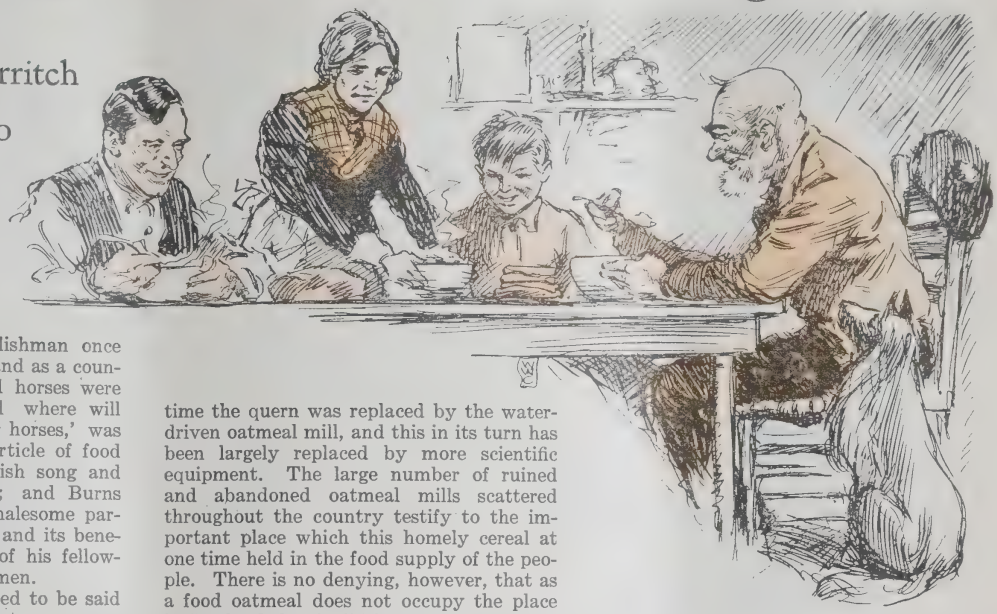
Virtually the only safeguard for life in these storms is to get underground and in a place where there is shelter from flying bricks, stones, and timbers. The 'cyclone cellar' of the West, in use on many farms as a convenient storage for fruits and vegetables, is still the best retreat when the funnel-shaped cloud shows up above the horizon. Next to it probably the best refuge is the southwest corner of the basement of a frame building, crouching close to the wall.

The funnel-shaped cloud hanging from the sky is a vortex of whirling wind that creates a vacuum by centrifugal force. Water vapor inside the whirl is condensed, giving the cloud a milky appearance. When it strikes a house the walls are blown out with explosive effect on account of the sudden reduction of air pressure.

Tornadoes usually come from the southwest and if a building is blown off its foundation debris is not likely to fall in the windward side of the basement, but may fill the opposite side with timbers that have almost the velocity of a projectile from a gun when they strike. A person caught in the open directly in the path of an approaching tornado is advised to run toward the northwest, as this takes him at right angles to the storm and toward the side where the wind is less violent. If there is no escape from the path of a storm before it strikes, the best thing to do is to lie flat on the ground, in a ditch or other depression if possible.

Not much can be said for the chances of escape for one caught in the congested district of a city in the path of a tornado. Brick and stone walls are liable to crumble under the terrific force of the rotary winds or be blown away by the explosive effects of the partial vacuum in the center of the vortex and bury their victims beneath them.

Probably the best thing to do if a person is caught in a brick or stone building when a tornado strikes is to stand close to an inside partition. Outside walls are more likely to be blown down than those of the interior of a building and the latter may help support sections of floor or roof that may fall.



Freaks of tornado damage and miraculous escapes from such storms are almost past belief.

When these clouds strike, buildings are demolished.

# The Passing of the Porridge Pot.

## Why Halesome Parritch of Burns Is No Longer Chief of Scotia's Food

AN EMINENT Englishman once characterized Scotland as a country where men and horses were fed on oats. 'And where will you get better men and better horses,' was the retort. Oatmeal as an article of food has been celebrated in Scottish song and story from the earliest ages; and Burns himself sings the praises of 'halesome parritch, chief of Scotia's food,' and its beneficial effects on the stamina of his fellow-countrymen.

*Oatmeal Helped to Win Independence*

It used to be said that Scotsmen were brought up on a little oatmeal and the *Shorter Catechism*, and until recently there was a good deal of truth in this; but times are changing in Scotland as in other countries, and there seems to be a tendency to go after other pabulum. In fact it may be said that oatmeal has played no unimportant part in enabling the Scottish people to throw off the English yoke. A little oatmeal mixed with water from the nearest brook formed a very refreshing drink for their hardy soldiers, and when sustenance of a more substantial form was required the mixture was made somewhat thicker and cooked in a camp kettle over a fire of peat. At a later period than that of Stirling Bridge or Bannockburn, the oatmeal was sometimes mixed with 'usquebaugh' in place of water and transformed into that nourishing dish mentioned by Sir Walter Scott, and known as 'Atholl brose.' Oatmeal in its various forms was therefore a prominent factor in the winning and building up of the independence of Scotland, for it built up and sustained the men who won that freedom.

If the inquiring stranger who penetrates the straths and glens and the remote uplands of Scotland uses his powers of observation in passing some peaceful sheiling or farm cottage, he may see, not far from the front door, perhaps cheek for jowl with a superannuated cheese-press of ponderous stone, another household implement which belongs to a still remoter stone age. This is the quern or hand-mill with which the guidwife of prehistoric times, and for many ages after, ground the oatmeal for the use of the family. This ancient appliance was extremely simple in its construction, consisting of two large flat stones, circular in form, one laid on top of the other, the upper having a hole or socket near its outer edge for the insertion of an upright handle with which the stone was turned on its axis on the one beneath. Between them was placed the oats, which were thus ground into a meal fresher and more wholesome than any that can be procured by modern methods. In course of time the quern was replaced by the water-driven oatmeal mill, and this in its turn has been largely replaced by more scientific equipment. The large number of ruined and abandoned oatmeal mills scattered throughout the country testify to the important place which this homely cereal at one time held in the food supply of the people. There is no denying, however, that as a food oatmeal does not occupy the place in Scotland that it did in former times, and modern ideas of dietary and cooking are slowly but surely dethroning the porridge pot.

*Teapot Dethrones the Porridge Pot*

Sometimes 'bear' or barley meal took the place of oatmeal both for porridge-making and for the baking of bannocks.

> 'Wha, in his wae days,
> Were loyal to Charlie?
> Wha but the lads wi' the
> Bannocks o' barley.'

Some of the county medical officers in Scotland, in the course of their official duties, have remarked the decreasing use of oatmeal, and in their reports have sounded a note of alarm. They say that in certain districts the teapot is replacing the porridge pot in popular favor, and that the fancy cakes and pastry from the cities appear more frequently on the table than the oat-cakes and home-baked scones of a former generation; but in the country districts, at least, it will be a long time before the porridge pot is relegated to the family museum along with the quern and the cheese-press. Oatmeal is still the staple food of the rural population, and in particular of the farm worker. There is a story told of a tourist who once met a herd boy, and struck by the sturdy appearance of the youth inquired what he got to eat. 'I get porridge for my brakfest, porridge for my denner, and porridge for my supper,' was the reply.

*The Only Daily Bread He Knew*

'But, dear me,' said the stranger, 'don't you ever get tired of porridge?'

'What wye could I ever get tired o' my meat? Besides, noo and than I get brose.'

To the unsophisticated laddie, porridge was his 'meat'—his daily bread—and he failed to understand how any one in his senses could ever get tired of such. With him it was the one thing necessary, and the 'brose,' which is but another form of porridge, made all the variety he wanted. Brose is more quickly prepared than porridge. It is made by putting the necessary quantity of oatmeal into a dish and pouring boiling water over it, the mixture being stirred with a spoon and eaten with milk or cream. Sometimes the soup off boiled beef is used instead of water, and occasionally boiled kale or turnips are added to the oatmeal. Oatmeal in the form of porridge or brose is still the staple food of the Scottish plowman, just as it was in the time of Burns, and he thrives on it and eats it with as much relish as his forefathers did. It is nevertheless true that in some parts of the country there is a falling off in its use, and this is particularly true in the more thickly populated areas.

Decreased devotion to the porridge pot is coincident with increased attention being paid to the teapot. Tea was almost unknown in the rural part of Scotland until well into the last century, and it was rarely seen on the breakfast table until within the last fifty years. Plenty of good fresh milk was used both for the grown-ups and the bairns, and one of the things that the doctors deplore is that since the decline in the use of oatmeal in Scotland, there has been a great falling off in the consumption of milk. This, they maintain, will ultimately seriously affect the physical if not the moral welfare of the race. It has been remarked that the decreased use of oatmeal is coincident with the decreased use of the *Shorter Catechism*, and some fear that the dethronement of the porridge pot would mean the dethronement of many of the cherished traditions and customs of the Scottish people. This does not imply that the use of oatmeal has been hitherto part of the national religion, but merely that any marked departure of the people from the homely and wholesome fare of their forefathers may be detrimental to the national psychology.

*Young Mothers Favor Easier Methods*

Some say that the younger generation of Scottish housewives have neither the thrift nor the energy of their mothers or their grandmothers, and that they 'canna be bothered' making oatmeal porridge over a hot fire in the old-fashioned way, but prefer to handle the easier manipulated modern breakfast foods. It is no doubt easier to please the bairns with the contents of the teapot and the jam-pot than it is with the porridge pot; and it takes less time and trouble.

# Ninety-Dollar Vice-President Boom

(Continued from page 7)

career and other press matter. We also went over the list of delegates and planned the missionary work that each was to do upon arrival at Cleveland. General Harbord or any veteran candidate was our objective, and we planned to mobilize the veteran delegates with this end in view.

General Harbord

With no objections, the chair recognized General Reilly, who placed General Harbord in nomination.

We had not been in Cleveland more than an hour before we were convinced that the leaders had no plans concerning the vice-presidency. No sentiment in favor of any candidate was crystallizing. Men who had ambitions for the place did not want their friends to bring them before the convention, fearing that the President would select some other candidate and they would be embarrassed by not receiving any support in the convention.

The situation was ripe for aggressive action by any group in the convention who would coöperate in the support of a strong candidate. The leaders of the larger delegations, such as New York, Pennsylvania, Ohio and Illinois, declared they were awaiting word from Butler. I expressed the opinion that Butler would embrace an opportunity of yielding to the veterans of the World War in naming a candidate. Small conferences of ex-service delegates were held at various headquarters until on the first day of the convention, at the request of Colonel John Thomas Taylor, a call was read from the platform for a meeting of ex-service delegates and alternates.

Colonel Taylor was at the convention to secure the adoption of planks in the Republican platform directed by the American Legion Convention. This accomplished, he became active when he saw a situation developing in which where was an opportunity to land a veteran in the second place on the ticket. Eighty-five delegates and alternates were present in the forenoon conference, which adjourned to meet in the evening, when there were 135 present. There was a third conference the following morning which was attended by more than 200 delegates, alternates, and veteran political leaders.

These conferences were attended by such men as Senator David Reed, of Pennsylvania, Representative Royal Johnson, former Assistant Secretary of the Navy Theodore Roosevelt, John Sherbourne, delegate at large from Massachusetts, Hanford Macnider, former national commander of the American Legion, Colonel Ralph D. Cole, former Congressman from Ohio, Governor Mabey, of Utah, all of whom had been prominent in the organization of the American Legion and among its leaders since its beginning.

The first two conferences did not attract much attention, and were not mentioned in the press dispatches. The third conference assumed the character of a caucus. It was the first meeting of the convention that had a definite objective or took any decided action. This was apparent when Colonel Taylor called the meeting to order. Colonel A. Piatt Andrew, a Congressman from Massachusetts, was promptly elected chairman, and Colonel Taylor, secretary.

Senator Bursum, who had led the fight for adjusted compensation, was introduced and was given a rousing ovation. Senator David Reed, who had opposed the bill, was called for and when he came forward with a doughboy swing and declared that Senator Bursum and Colonel Taylor had surely 'given us a trimming in the fight over the adjusted Compensation Bill,' his ovation was equal to that of Senator Bursum. None of the differences over policy matters disturbed the caucus. On one thing they were all united: that a veteran should be nominated for the second place on the ticket.

'Are nominations now in order?' inquired the chairman, after four or five speeches had been made. 'Yes,' came from the gathering in a roaring chorus.

'If anyone present is opposed to this meeting endorsing a candidate for Vice-President, I pause to give him an opportunity to state his objections,' was the way the chairman placed the question before the caucus.

With no objections, the chair recognized General Reilly, who placed General Harbord in nomination. Colonel Ralph D. Cole placed General Dawes in nomination. General Frank T. Hines, director of the Veterans Bureau, was nominated by Governor Charles R. Mabey, of Utah. The Utah delegation was instructed for General Hines. At the same time Governor Mabey agreed to submit to the decision of the caucus. After describing the achievements of General Hines, Governor Mabey struck the keynote of the caucus when he said:

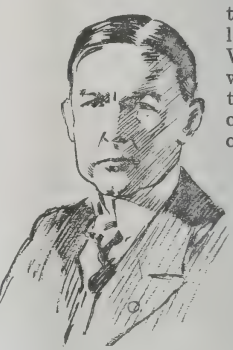
Charles G. Dawes

'Shall it be today that the Republican party does not want to nominate a man who served his country in time of war, in time of peace, or whenever called upon so to do? No, my buddies of the World War, it cannot be, it is not so.'

A motion was carried authorizing a committee of one member from each state represented to select a candidate from the three who had been placed in nomination. This committee selected General Harbord. With this information I wrote the story of the day for my newspaper.

When I reached the Cleveland hotel the report of the action of the Veterans Caucus had reached the leaders of all of the larger delegations. All the other correspondents were sending out Harbord stories. When I met Senator Wadsworth in the lobby he expressed the opinion that the action of the caucus virtually nominated Harbord. Senator David Reed told me that the delegates were lining up for Harbord.

'Your hero,' said Speaker Nicholas Longworth, 'appears to be running away with the prize.'



Secretary Weeks declared that the larger delegations were only waiting for the result of the farm bloc caucus, which had been in session since early morning. He was of the opinion if the farm bloc conference did not endorse a candidate, the way would be clear for General Harbord.

From another source I learned that the farm bloc caucus was called to nominate Senator Curtis, of Kansas. This, it was claimed, was the move of Senator Butler.

Hanford Macnider, former commander of the American Legion, presided at this conference. It refused to endorse Senator Curtis, and the nearest approach to an agreement that it was able to reach after being in session all day and until two o'clock the next morning was to authorize each state delegation to name four acceptable candidates. Even in the farm bloc conference, Harbord was named on three slates and Dawes on the same number.

With this information in my possession I rushed back to the Cleveland hotel, fully convinced that Harbord was as good as nominated, *only to be told that Borah had been selected by the President.*

When it became apparent that the farm bloc would not stand as a unit for Senator Curtis or any candidate, it is stated that Senator Butler called up the White House and asked in effect, 'How about Borah?' From what I have been told since, they were looking forward to the World Court fight and wanted to tie up Senator Borah in the chair of the presiding officer of the Senate.

The soldier-group united in favor of General Dawes.

While this was going on Senator Wadsworth called up General Harbord and informed him that the President had indicated that he wanted Senator Borah. Under these circumstances General Harbord wired directing that his name be not presented and that his friends cease their activities.

When a committee from the farm bloc called upon Senator Butler to make its report of the action of the caucus, it was not allowed to proceed; the Senator interrupted by declaring that the President wanted Senator Borah.

Thoroughly disgusted with this proceeding, the chairman of the committee informed Senator Butler that he had no authority

from the caucus to act on the candidacy of Senator Borah.

Here is where Senator Butler lost control of the convention. Senator Borah reiterated his previous declaration that he did not want the nomination and would not accept it. The next morning the great body of delegates were looking for some candidates that Butler did not want. His suggestion of different names was fatal to the prospects of those candidates.

Governor Lowden was nominated to give the leaders an opportunity to get in touch with the sentiment of the delegates and secure control of the situation. It was known that Lowden would not accept when he was nominated.

In turn, Burton and Kenyon were urged by Senator Butler, but the convention would not accept either of them. In his desperation, Senator Butler made an effort to nominate Herbert Hoover, but the convention fairly laughed at his effort.

General Frank T. Hines followed the example of General Harbord and withdrew his name after the convention had nominated Governor Lowden and he had declined. This made it possible for the soldier group to unite in support of General Charles G. Dawes. At no time did Senator Butler indicate in any way his approval of Dawes' candidacy, and a convention which, when it assembled, was asking 'What does Coolidge's spokesman want?' nominated Dawes.

## Camping Out

EVERYBODY occasionally feels rebellious toward the monotony of life. There comes a period when humdrum tasks pall, and even business success fails to satisfy. Then is the time to get out in the open and regain a part of that country freedom that was once the daily life of most of our people. A person who has no holidays in the open, who never takes a trip to the mountains or the seashore, becomes cramped and narrow-minded. He is more a liability than an asset.

A holiday in the open sends one back to work refreshed and with a new outlook on life. The most successful men in any business are those who take necessary vacations. Problems solve themselves for the man who is rested; he retains the vital faculty of discernment.

Several million Americans spend an average of more than two weeks at the seashore, the mountains, lakes and rivers. Those who cannot get away for two weeks or more resort to the popular 'week-end trip,' and owners of automobiles spend a day or two almost every week in the summer season driving in the country.

The children of the city are becoming more and more familiar with green fields, trees and waters. Bathing, boating, hiking and woodlore are becoming part of the child life of the nation. With the many new inventions for the camping tourist one can be almost as comfortable in the open as at a hotel. The necessity of obtaining only pure drinking water at each camping point, however, should be stressed. Many a sparkling brooklet crossing the road has its source far up the country, and may contain disease germs. Many a picturesque old oaken bucket hung from a sweep harbors the deadly typhoid bacillus. It is best always to boil water, for surface seepage will creep into the rivulets.

Camping out makes for a vigorous and healthy race without which no nation can ever hope to prosper.

# Are Federal Offices for Sale?

(*Concluded from page 3*)

them the amount. I told them it would probably cost about $250 or $500 if they had to make the second trip, but that whatever they were out, I would refund upon receipt of their expense account. This, however, did not seem to interest them.

'They then left the room for a few minutes and A. M. Redmond returned alone. After a little discussion of the above proposition, A. M. Redmond told me if I would put up $1,500, placing it in a bank to their order, that he knew I could land the place; but, in case I did not get the position, he would of course deduct all his expenses from the $1,500 and return me the balance. The proposition to sell the position to me was wholly unexpected, and I countered back, telling him that I thought $1,000 would be enough. A. M. Redmond then asked me if I meant $1,000 with expenses added. I said, "Yes, but the expense is not to exceed $250." We argued back and forth, but $1,500 was their price and he would not change it. It was then about 6:15 p. m., and a suggestion was made that we get a lunch and meet again after lunch. I asked him what time he would get back, and he said about seven. I told him it might take longer to get my lunch and we had better make it 7:15. This was agreed to by Redmond, who left telling me to think the matter over. I told him that the office only paid $3,000 a year and that $1,500 was six months' salary and that possibly I might not hold the place a full term; that while I would like to have the place for the honor, if I got it I certainly would do my duty.

'We separated, and I went to a restaurant and ate supper. At 7:15 I went back, met both the Redmonds and went again to their office. After we got there, S. D. Redmond showed me an agreement, dated February 24, 1924, between himself and Perry W. Howard, signed P. W. Howard and S. D. Redmond, wherein it was agreed that S. D. Redmond was to be consulted in the appointments of U. S. Attorneys and U. S. Marshals for Mississippi. They showed this agreement to me to prove that what they said in regard to the appointment of a marshal for this District would go. After seeing the agreement, I said something about the $1,500 cash, and S. D. Redmond said that would be between myself and his brother, and left the office on some business. After S. D. Redmond left, A. M. Redmond again took up the question of the $1,500. I told him that at the time it would be impossible for me to put up the amount as what cash I had, outside of my living expenses, was out on notes, and I could not collect any of it before January 1, and that further in regard to the expense of a trip to Washington, before I could tell him definitely or put up the amount of $250, I would have to go home and check up my bank account and see what my balance was. I further told A. M. Redmond that I knew there were Democrats who would pay more than $1,500 for the office. After a little more discussion, it was agreed that I would go home and as soon as I could check up my bank account, I would write him what I would do. I asked him to write me but he said he would call me over the phone and I gave him my phone number, 166.

***About the Trip to Washington***

'During the conversation with the Redmonds, they repeatedly said they wanted me to be the next U. S. Marshal for the Northern District. I told them that I had always put up all the expenses for the Fourth District and that I could control it in the future as I had in the past, and for the sake of harmony it would be well to have me with them.

'The foregoing is a true and correct statement as I remember the conversation. The offer of the office for $1,500, said amount to be placed in a bank to the order of the Redmonds, was made very clear. They told me that we would have to get busy as the appointment was to be made in a few days and I was impressed with the necessity of letting them know my decision at once.

***Offer Came as a Shock***

'The offer to sell the marshal's office for $1,500 was a shock to me and at first I could not realize the fact that the positions of the Government were being put up for sale. True, I had heard it rumored that this was being done, but this was the first absolute proof that I had of the truth of this report.

'I was appointed Postmaster at Kosciusko by President McKinley and reappointed by President Roosevelt, serving six years and resigning on account of business matters. In 1908, I was appointed U. S. Marshal for this District by President Roosevelt and reappointed by President Taft, serving about six years.'

That criticism of the official Washington attitude is not confined to Democrats is proved by the following statement from L. E. Oldham, a lifelong Republican and United States District Attorney until January, 1926:

'Personally I know that the President, the Attorney-General, and Chairman Butler, of the National Republican Committee, have been fully advised of this situation. They have known it for months but have declined to take action. The Attorney-General has been begged, entreated and implored to either correct this situation or exonerate Perry Howard and his gang. The Attorney-General does neither, but treats those patriotic citizens demanding decency in the administration with silent contempt.

'I have been a lifelong Republican. I shall continue to be, but I do not consider my party loyalty in question because those temporarily in authority permit such conditions to exist.'

The scandal, according to Representative Busby, is not confined to the marshalship.

'I have photostatic copies of dozens of affidavits and papers which are on file in the Department of Justice,' he said. 'I defy the Attorney-General's department and the Postmaster-General's department to lay open the facts covered in the investigations.

'What I am asking is not for some underling to appear before the committee and make a false report about a thing that he does not care to disclose. I am asking for the documents and the reports themselves.'

The judiciary committee of the House disposes of the matter as follows:

'In no case has the authority investigating the matter found evidence warranting the prosecution of Perry W. Howard. In fact there was no evidence whatever connecting him with the charge of abuses in connection with patronage. The reports desired are now in the office of the Attorney-General and have been carefully considered by him. John Marshall, Assistant Attorney-General, appeared before the Committee and explained the status of the case.'

# I Read in the Papers

'Latvia suffered more than any other land, except Belgium and Northern France, from the horrors of the Great War, and the bare stone walls of dozens of Baltic baronial castles, with the ashes of thousands of humbler dwellings, testify to the unutterable ruin worked by Russian, German, or Bolshevik. The bulk of the movable wealth of the country, the money belonging to banks and other institutions, commercial, social or religious (among these, be it mentioned, the capital of the English Church in Riga), the library, and the scientific instruments of the Polytechnic or High School of Engineering of Riga (which now forms part of the great Latvian University of Riga, with its eleven different faculties and its 6,000 students), the fittings of factories, foundries and workshops, with the bronze of church bells and statues—all this was evacuated in the early years of the war to the interior of Russia, except the statues of Peter the Great and of that doughty general of Scottish descent, Prince Barclay de Tolly—*i.e.*, of Towie, in Aberdeenshire—both of which lie buried in the sand at the bottom of the Baltic Sea.

***What Latvia Suffered in the War***

'How much of this has been returned? A few cases of silver that had been deposited in various banks, several cartloads of the smaller church bells, and a miscellaneous and very incomplete collection of books from the library of the Polytechnic—that represents almost everything that the all-devouring maw of the Eastern neighbor has so far disgorged. By the time the Germans entered Riga there was little left in the town to loot except furniture, but of that many trainloads were dispatched to Germany, Baltic German households in Latvia being naturally left unplundered; and while the Bolsheviks during their short stay could destroy much, they were of course unable to remove much valuable property.'

ɤ ɤ ɤ

'The Highland bagpipe, or *piob mhor* (great pipe), has been the national instrument of Scotland for over 200 years.

***The Great Highland Bagpipe***

'About the year 1700 the harp was actually superseded by the pipes; for several generations previous to that time the harp, or *clarsach*, and the bagpipe were played, figuratively speaking, side by side in the castles of the great Highland chiefs.

'The harp was the instrument of peace; the pipe was a more robust instrument, and could be played in peace and in war. The playing of the harp declined sadly; it is now rarely indeed heard in the Highlands, but efforts are being made to revive the old music. It is possible that the harp's decline was due to the decay of the art of the bard who sang his verse. The two arts of harpist and rhapsodist decayed together, and from the same cause.

'*Ceol Mor* (in English, "the big music") in the classical music of the Highland pipe, as opposed to *Ceol Beag* ("the little music"), which comprises marches, strathspeys, and reels. Each composition of Ceol Mor is nowadays known as a *Piobaireachd* (Anglicè, *Pibroch*). It is surprising how few, even among Scotsmen, know the meaning of the word "piobaireachd." Even in the Highlands there is an impression that a piobaireachd must be a lament. But this belief is erroneous, for a piobaireachd may be a battle-piece, a salute (such as the salute composed at the birth of Ruaraidh Mor MacLeod), a "gathering" tune (such as *Tulloch Ard*), or a lament.'—*The Nineteenth Century and After.*

ɤ ɤ ɤ

The Rev. Dr. Henry Sloane Coffin, who is soon to assume the presidency of Union Theological Seminary, told Yale students in an address in Dwight Hall that they had assumed a grave responsibility in insisting upon the abolition of compulsory chapel. It was a mistake.

***Yale Students and Churchgoing***

It was now up to the students voluntarily, he said, to maintain the tradition of 225 years and see that the purpose set forth in the Yale charter, to 'uphold and propagate the Christian Protestant religion' was not forgotten.

ɤ ɤ ɤ

The *Editor and Publisher* says: A committee to investigate thoroughly sporting departments and sporting publicity has been appointed by Erie Hopwood, editor, *Cleveland Plain Dealer*, in his capacity as president of the American Society of Newspaper Editors.

***Are They After Baseball?***

Appointment of the investigating committee is the result of discussion of the subject at the annual meeting of the Society in Washington last winter, where it was denounced by some editors as an evil.

The investigation will embrace 'sporting publicity, the management of sporting departments, and the best means of handling sporting copy,' Mr. Hopwood said.

Members of the committee are:

Will Owen Jones, editor, *Lincoln Nebraska State Journal*, Chairman; M. W. Bingay, managing editor, *Detroit News;* Moses Strauss, managing editor, *Cincinnati Times Star;* E. Robert Stevenson, managing editor, *Waterbury American;* Philip A. Payne, managing editor, *New York Daily Mirror;* Charles M. Stanton, editor, *San Francisco Bulletin.*

ɤ ɤ ɤ

Paul Scheffer writes: 'Since coming to China I have visited many universities, where I have been particularly interested in learning how the students live. Their lodgings form a striking contrast to the magnificent libraries, assembly halls, gymnasiums, and laboratories with which those institutions are so generously provided. The question intrudes itself, why should huge sums be spent for such buildings while the young people who use them must sleep and study in cramped, dark, dank, cellarlike Chinese lodgings? It is a psychological question how far the traditional low scale of living of the young Chinaman should be permitted to continue while he is surrounded by all the luxuries of a typical well-endowed American college.'

***Chinese Students Poorly Lodged***

—From *Berliner Tageblatt.*

ɤ ɤ ɤ

'The conspiracy of a large part of the Anglo-Saxon political world against us is most disheartening. Let us admit that we have committed serious blunders. Our diplomats have often tried to play too shrewd a game both at London and at Washington. Their petty finesse and their occasional flashes of temper have exposed them to the charge of duplicity. Errors due for the most part to the lack of a program have been interpreted as evidences of bad faith. The mistake we made at the Washington Conference, of trying to maneuver against the British Empire and the United States, has not been forgotten. Our evasive procrastination in regard to our debts, while perfectly legitimate when one knows all the circumstances, has sometimes taken an irritating form. Furthermore, our parliament, our press, and our public opinion have only too often harmed the cause of France by their excessive sensitiveness and nervousness even more than have our diplomats. Therefore the suspicion that rests upon us is not entirely unjustified.'—From *L'Opinion.*

***France Speaks of Anglo-Saxon Opinion***

ɤ ɤ ɤ

Cigaret smoking is not a drug habit, but is taken up by the individual because of the working of an inferiority complex, Professor Olen Deweerdt, head of the department of psychology at Beloit, hopes to prove by an experiment being made by a group of college students.

Professor Deweerdt believes that individuals begin to smoke and continue to do so because they consider themselves 'out of things' and queer if they don't. Nine college students in psychology courses are engaged in the experiment.

## What of the Filipinos?

(*Concluded from page 5*)

was read a fixed prayer for independence, in which were embodied sentiments reflecting neither respectful allegiance to the United States nor admiration for any of its institutions. And in the plaza the native speakers harangued their fellow citizens in half a dozen dialects on the 'neglect and indifference of our master, the American people!'

What, then, is it they want, these people whose aspirations were born only with the development of their intelligence through America's aid? That is not easy to say. Nor is it altogether certain that they themselves know. Indeed, that is the real weakness of their position. They do not want to separate altogether from America, one gathers; yet they want independence, or insist that they do. There is good reason to believe that they do not at all comprehend just what this means, and that they realize little or nothing of its responsibilities. They want independence and yet they do not want it. The more intelligent understand clearly that entire independence is by no means feasible, that their plight, left entirely to themselves, might become serious. Yet it is clear that all feel themselves entitled to a greater measure of self-government, or a sort of protectorate.

Cuba is, of course, their example. We gave Cuba independence. Why not the Philippines? Can we tell them they are not fit for it, and thus set them lower in the national scale than the Cubans? But they contend that we are doing that very thing by our refusal to heed their pleas.

The Filipino's attitude would be a good deal less truculent if he thought we had the requisite amount of interest in him. The trouble is that he is certain we are wholly indifferent. His newspapers, one of which is printed in English in Manila, stress continually the point that the average American cares little or nothing about the Filipinos, their needs or their desires. Are we altogether in a position to deny this accusation?

Much harm is done by persons spending a few hours in Manila, who assert that the islands should be independent, though they possess no knowledge whatever of the real conditions. The other day a great liner tarried for a few hours in Manila, and one of her passengers, an Englishman, declared to the newspapermen that 'England would have given the Filipinos independence ten years ago.' This ridiculous assertion was immediately emblazoned on the front page of the Manila Filipino organ, and much stressed editorially.

I have found that the Filipino feels, or at least expresses, a good deal of respect for General Wood, though he resents the Governor-General's attitude as to independence. The native also appreciates the employment of his people in official positions, quite as much as he appreciates many other things America has done for him, and he understands well the value of all those things.

I venture to say that, if a plebiscite were taken in the islands today on the question of complete independence or the largest possible measure of self-government under the protection of the United States, the vote would be for the latter. But whether any greater measure of autonomy than at present exists is advisable remains a question.

# A Dance A Week

## DICTIONARY OF DANCE TERMS

(The figures indicate the measures of music required to execute the calls.)

'ADDRESS'—(8) Partners first address each other, then their respective corners.

'ADDRESS PARTNERS'—(8) Gentleman steps forward to center with left foot, turns and faces partner; closes right foot to left and bows. Coincident with this, the lady slides right foot toward center, faces partner, steps back with left foot, bending both knees for the curtsey, then draws left foot to right.

'ADDRESS CORNERS'—From last position in 'Address partners,' the dancers step back to place. The gentleman then slides right foot toward center facing the lady on his left, closes left foot to right, bows, and steps backward to place. The lady at the same time turns to face corner by sliding her right foot toward the outside of the set. She then steps backward for the curtsey.

'ALLEMANDE LEFT'—(8) Couples turn back to back, and walk four steps to corner (forming a square figure), each meets a new partner; give right hand to each other, and turn. Return to place (four steps), give left hand to partner, and turn.

'ALLEMANDE LEFT' in some localities precedes the call 'grand right and left,' and is executed thus: each gentleman turns the lady on his left with his left hand (lady also gives left hand) 4 bars, and immediately after gives right hand to partner and executes grand right and left, 16 bars.

'ALLEMANDE RIGHT'—(8) Lady walks four steps to left side (passing in front of partner); gentleman walks four steps to right. Each meets new partner on corner; give right hand, and turn. March back to place, give left hand to partner and turn.

'BALANCE AND TURN PARTNERS'—(8) Partners face each other, take three short steps backward and rest; then forward and rest; join hands waist high and turn once around.

'BALANCE IN PLACE'—(4) The balance step is made thus: Step to side with right foot, point toe of left foot in front, step to side on left foot, point toe of right foot in front.

'BALANCE AND TURN CORNERS'—(8) Face corner. The balance step is made thus: Step to side with right foot, point toe of left foot in front, step to side on left foot, point toe of right foot in front. Then join hands and turn once around. Return to place.

'BALANCE TO CORNER AND TURN PARTNERS'—as used in the Lancers (8) all turn, face corner; each dancer take four steps toward each other, and four steps backward. Then all face their own partners, give both hands and turn.

'BALANCE FOUR'—(8) Gentleman crosses hands with partner, his right hand above. They promenade to opposite side, each couple passing to the right. Turn (as on a pivot, without the lady changing sides) and return to place, still keeping the lady on the outside.

'BALANCE IN LINE'—The four ladies move forward, and join right hands across. Each lady then places her left hand in her partner's left hand, and all balance in line.

'CHANGE PARTNERS, CHASSE OUT IN LINE'—(8) Couples lead to the right, give both hands to opposite, make three-fourths turn to right, stopping four in line, facing the opposite four. Each gentleman is now facing his own partner. Where the end couples execute this movement, it results in the line forming along the ends. When the side couples execute it, the line is formed along the sides.

'CHASSE BY COUPLES'—(8) Called when couples are formed in two straight lines two couples in each line, facing each other. Couples on the right in each line, chasse four steps to the left, passing in front of couple on their left. At same time couple on the left chasse four steps to the right, and back of other couple. Couples have now changed places in their own line. To return to place, couple on the right chasse to the left; couple on the left, chasse to right.

'CHASSE OUT AND FORM A LINE'—(8) Two couples lead to the right, give both hands to the opposite couple, and turn three-quarters to the right, stopping four in line, and facing own partners.

'CHASSE RIGHT OR LEFT'—(4) A gliding step with either foot in the direction desired. If to the right, the right foot glides, the left is drawn to it in a closed position, and repeated as often as desired.

More terms used in the Old American Dances will be published in next week's issue.

---

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Please order by number.

# What Dieting Did for Bill

(Concluded from page 8)

workers were rushing frantically about, trying to quell the rumpus. The minister, in paralyzed embarrassment, watched the flying pies and celery, and didn't dare begin to ask a blessing for what he was about to receive.

Through the hubbub, Bill heard the hated leader of a rival gang calling him a 'red-headed monkey.' Bill grabbed a dish of cranberry sauce and rubbed it in his enemy's hair.

'Redhead yourself!' he shrieked. 'Redhead, redhead, red-headed wop!'

Instantly the brimming dishes of cranberry sauce all up and down the tables were raided, and the color of most of the youngsters' hair turned to a startling ruby hue amid the hilarious chant of 'redhead'! Before order was finally restored, the great neighborhood Christmas dinner for the poor boys had become a messy fiasco.

When Bill was brought into court next day by one of the welfare workers, who pronounced him incorrigible and wanted him sent to a reform school until he was twenty-one—seven long years that would have been—I studied him carefully. His flaming hair and his blue eyes, with an unrepentant twinkle in them, were the only touches of color about him. His face was sallow. His figure was a trifle stunted. There was a drawn look about him that did not come at all from the cares of being a Napoleon. It was caused by undernourishment.

Now why should Bill and these other half-starved youngsters of the poor, each suffering from malnutrition, have been so recklessly wasteful of that great Christmas dinner? Well, you see, celery and olives and salads and cranberry sauce were so far outside their range of experience that they had no respect for them. They didn't think of these table delicacies as expensive. They didn't think of them as food. And they didn't think of themselves as undernourished. Probably they didn't even feel hungry, because they had eaten a big hunk of bread or some fried potatoes just before they left home. They came to the party to have a good time. Throwing things is one of humanity's most fundamental ways of having a good time.

*Filled Up on Meat and Potatoes*

Bill's case was held over, and the next day I went out to the reform school and sat down to dinner with the boys who were there. The head matron sat next to me. We had soup, beef, potatoes and rye bread.

'What do the boys like to eat most?' I asked the matron.

'Well, the new boys,' she answered, 'want the same kind of food they have had in their own homes. We try to give them a balanced diet, but they prefer to fill up on meat and potatoes. They have to be educated to eat vegetables.'

'Do they like celery?' I asked.

'They call it goat food,' was the laughing reply. 'You see, when they come to us, they aren't exactly starving. They have had food when they were hungry at home, but it was the wrong kind of food. Lots of them aren't bad boys. They are just badly nourished boys. Lack of a proper diet has upset their glandular balance, as well as their stomachs and brains. It isn't so much juvenile delinquency as diet deficiency that we often have to solve here. And it is hard because the boys are so habituated to the wrong foods.'

That afternoon I went to the place Bill called home. From an alley I climbed a flight of wooden stairs to two rooms in which he lived with his mother, father, two younger brothers and two baby sisters, one of whom was crying on the floor. One of the rooms was combined kitchen, living room and bedroom for the three boys. It was full of smelly steam. A coffee pot was simmering on the stove. A big loaf of bread and a soup plate filled with oleomargarine graced the table. There was nothing else on the table but a knife.

I have seen many such interiors in slum districts, and I know just what the domestic routine is. The older children run wild in the streets all the time. There are no regular meal hours for anybody except the 'old man.' Whenever the children feel hungry, if it happens to be eleven o'clock in the morning or four in the afternoon, they come indoors and cut off a big slice of bread. They put a dab of oleomargarine on it, pour themselves a cup of coffee, and eat on their feet, looking out of the window, or scuffling among themselves.

*Such Was Bill's Home*

The father has a regular evening meal; sometimes a stew, but more often bread and margarine and coffee, with potatoes fried in the rancid grease that stays all the time in a frying pan on the stove. If the children happen to be around while he is eating, they share some of this.

Such was Bill's home. Investigators for charitable societies will tell you of many like it. I tried to find out something about Bill's record, but I found his mother knew less about him than anybody. From his neighbors and his school-teacher I learned that he was the toughest kid in the alley, and dull in his classwork. He was a trouble-maker wherever he went—always bullying other boys, always noisy and disorderly, always the first to throw stones through empty warehouse windows or to break out in some other irresponsible hoodlumism.

His teacher told me she thought Bill was bad because he was too unintelligent to be good. She had never thought that perhaps he was unintelligent because he was too undernourished to be smart.

For my part, I wondered whether Bill's badness wasn't to some extent a case of nerves. And I speculated on the possibility that malnutrition might be the underlying cause. Bill's whole system was warped askew because he had been brought up since early childhood on a diet of bread and coffee. His blood and bones and every tissue of his body were crying out for the food elements that would give them their normal development. He was irritable all the way through, and this state showed itself in a constant war with his associates. His mental capacities were dulled for lack of proper diet. So he didn't have the intelligence to foresee the consequences of his impulsive acts; it always took him two years to make a grade in school, and this resulted in his being thrown with younger and smaller boys. Such association catered to his sense of superiority and led to his being the ringleader in every form of juvenile deviltry. He was flattered and encouraged in his ways by the fact that the younger members of his gang looked with respect upon him for the very obstreperousness that made him obnoxious to his elders.

I decided to see what diet instead of discipline would do for Bill. I have seen emaciated, dull, nervous children made into happy, peaceable leaders in their school work by a few months of proper diet. The menace of malnutrition has been so widely explained of late that it need hardly be insisted upon here. The only trouble is that society recognizes it in principle and fails to act upon it in practice. Here and there progressive school boards are making up diet deficiencies in the case of backward pupils; but a glass of milk prescribed during school hours won't solve the problem of the child who ought to have well-balanced food at regular meal hours at home.

Forty-two states are now spending $25,000,000 annually in a system of pensions for destitute mothers because they recognize this fact; because it is obvious that every child has a right to proper physical as well as spiritual nourishment in a normal home environment.

These things were in my mind when I made Bill a test case. I took him into my own home and began to educate him to a recognition of celery as a food rather than a missile. He was gradually weaned away from coffee and white bread. Soon he stopped calling milk 'slop' and took to whole wheat bread with relish.

The vegetables and salads that he scoffed at, first, as 'cow feed,' later became a normal part of his diet. He had regular, well-balanced meals, with vegetables so cooked as to preserve their mineral salts, and with fats and proteids and starches in something like scientific proportion.

Gradually the twinkling promise that I had detected in Bill's Irish blue eyes was realized. His sallow cheeks gained the color that should have gone with his flaming hair. And his unruly restlessness was allayed. His gang-leader habits were too ingrained to be entirely conquered, and I was never quite sure he wouldn't upset the peace of the house with some wild prank. He became the boss of the neighborhood boys, and as his strength increased he only became the more formidable in a backyard fight.

But I didn't attempt to discipline him drastically. I was relying on diet. I found that he became more cheerful and reasonable when it was necessary to reprove him. As his mind cleared he reasoned sensibly about his freakish impulses, and often restrained them. He stood more erect, looked me straight in the eye, and began to cultivate a self-respect that meant more to him than had the adulation of his old gang.

*Change in Diet Soon Told*

The change in his diet gradually told in his school work, and when he found that he was actually keeping up with his classes, and actually shining in some of them, he began to realize a complete new set of social values. He no longer felt himself an inarticulate, downtrodden rebel, and so he didn't have to disturb the peace in order to gratify his vanity. He discovered that he was clever enough to outstrip other boys in studies and competitive games, instead of only in rough-and-tumble brawls.

Bill became one of the class speakers at his high school commencement. Bill was an experiment to me—a costly and soul-trying one—but I wish that thousands more of such experiments could be made.

# Church Gems of Italy

## Old Masters' Legacy of Paintings and Mosaics

By JUDSON GRENELL

THE churches of Italy early in the Christian Era were the greatest advertisers in the world. This is one of the lasting impressions I have brought back with me to the United States after spending a year in Europe. I am not sure that they do not still hold this position.

An almost endless procession of Old Masters have passed before me. I have also seen literally thousands of copies of the originals, many of them hardly inferior in execution or beauty to these now priceless creations. Both originals and copies are wonderfully illuminating in showing the reason for Italy being such a mecca for religious enthusiasts and aspiring painters.

Ruins of ancient temples, palaces, forums and amphitheaters have their fascinations when combined with imagination in reproducing the scenes common to those who lived in the long ago; but they make no such appeal to the heart as is made by the early pictures to be found in Italian churches, museums and galleries of the Virgin and Child, now priceless, though originally having no remarkable commercial value.

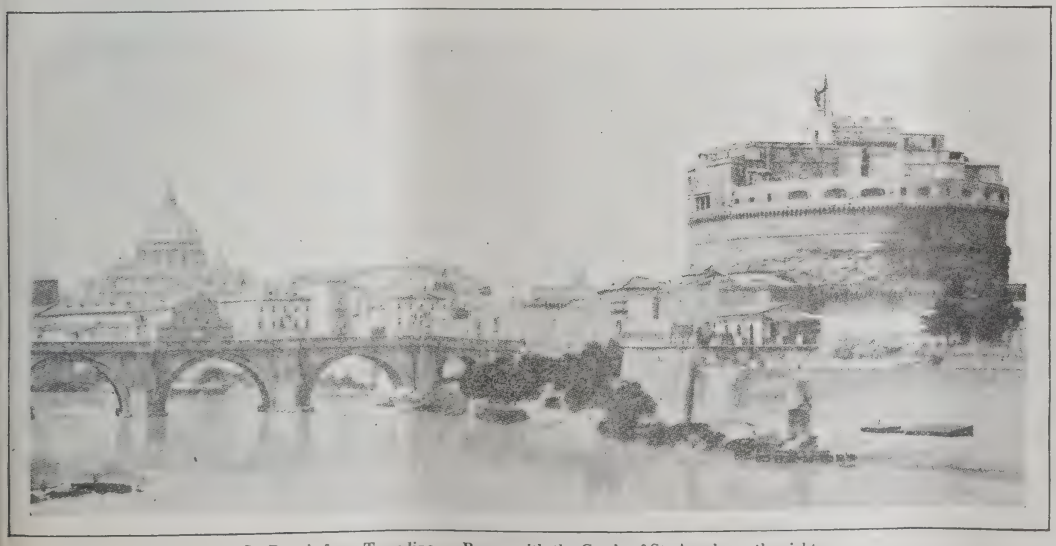
When one speaks of Italian churches one means practically the Catholic churches. Protestant churches in Italy are few. They are there, to be sure; I attended them in Rome and Florence; and I regard it as a fact that Protestantism has obtained no material hold on the inner and religious life of the masses of Italy.

I am not an art critic nor a connoisseur. Far from it. Pictures and statuary and styles of architecture must be plainly labeled—in English—if I am to be at all sure of the school or period to which they belong. Still, by dint of innumerable repetitions, I should be dull-witted indeed had not my eyes finally conveyed to my brain some idea of the fashions in art followed at the time these masterpieces were produced. Among other things I was impressed with the sincerity of the painters' efforts to convey what they believed to be religious truths.

Christianity early began this form of artistic advertising. The propagandists struggled for their religious faith against a hostile world. There were in those days no newspapers to champion their cause, no advertising medium recognized as such, no billboards. The art of printing was in embryo and illiteracy was universal.

It was therefore a real inspiration when the Early Fathers seized upon the arts of painting and sculpture to advertise the advantages of their communities as spiritual centers. Italy was divided into independent kingdoms, each jealous of its neighbors. Rome, Naples, Venice, Pisa, Florence, Milan and other walled cities strove to make the best showing. Great cathedrals with their wonderful campaniles reared their massive structures above all other buildings. The Babe in the Manger, with His Virgin Mother, was made central in the church decorations. While each church and monastery had its Christ on the Cross, it demanded many paintings of the Virgin and her Child.

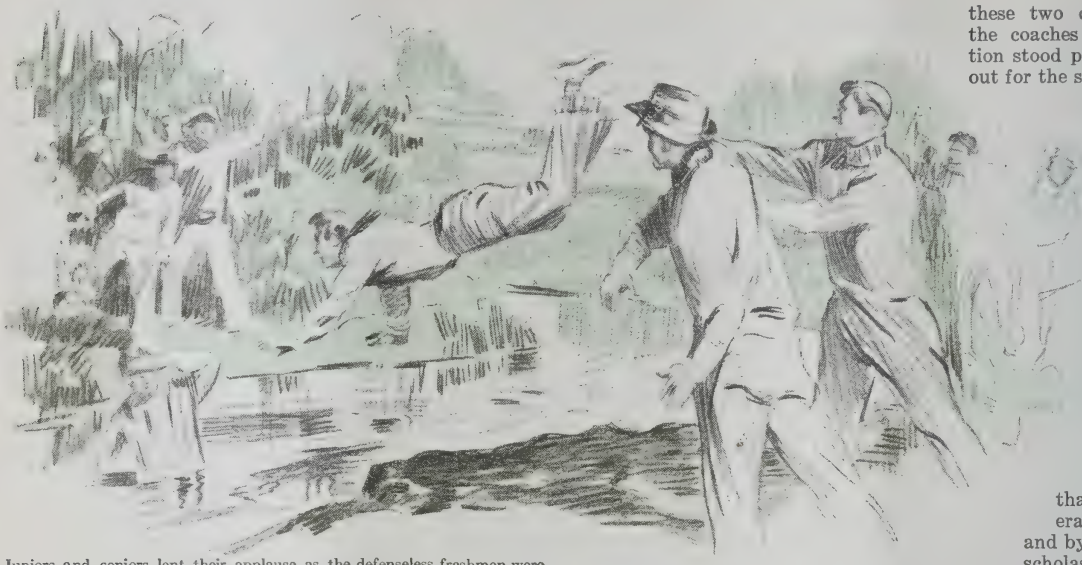
Here was occupation for Michelangelo, Leonardo da Vinci, Fra Filippo Lippi, Raphael, Van Dyck, Botticelli and a host of other masters in their arts. The painters took for their models of the Mother of Jesus that type of womanly beauty which most appealed to them. Thus there are to be seen in the churches and cathedrals of Italy, and occasionally in juxtaposition if not on the same wall, blond and brunet Marys, of various ages, with graceful figures and Italian, French, German or Dutch faces, depending on the nationality of the artist or the availability of a model.



Mary was seldom painted without the Infant Jesus, and this still remains the custom. She is richly gowned, as befits the Mother of God, even though Joseph was a carpenter and Christ was born in a manger.

Other Bible texts supplied subjects for the painter, but there are more Mother-and-Child paintings than paintings of any other dozen subjects combined. While Italian sacred edifices are crowded with religious mosaics, paintings and frescoes created by masters, masters' pupils, pious monks and others, no picture has such commanding interest as Mary and Babe. Yet all have human interest because painted under almost insurmountable difficulties by those who firmly believed in the reality of what they were painting.

Virgin and Babe, by Murillo.



These paintings of the birth of Christ, the adoration of the Wise Men from the East, the Child in the Manger with cattle placidly looking on, or of the Child surrounded by bishops and priests in pontifical robes (which is an anachronism, of course) have been copied on canvas and reproduced in mosaics year after year. An army of artists still pursues this occupation as a means of livelihood, though without the intense interest in the subjects which inspired the masters. Lithographing, color printing and kindred arts enable enterprising manufacturers to duplicate as to color and tone, in endless number, the masterpieces that hundreds of thousands of tourists from all over the world annually flock to Italy to see. In the art stores of Italy, notably those of Rome and Florence, much time is given to showing these, and often the exhibition is more satisfactory than seeing the original paintings, because the copies are better lighted and more conveniently placed.

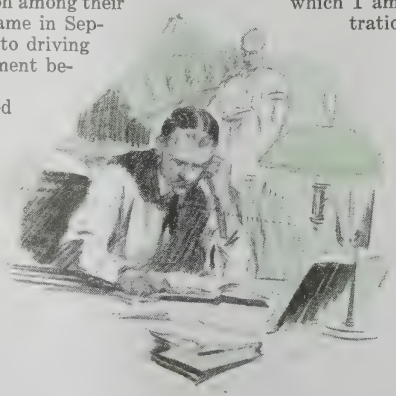
St. Peter's from Torredinona, Rome, with the Castle of St. Angelo on the right.

# In Defense of Athletics

(Continued from page 4)

Juniors and seniors lent their applause as the defenseless freshmen were tossed into the stream that crept through the campus.

ministration still holds to the idea that the athlete is a moral and intellectual moron and that athletic contests are cunningly devised schemes of the devil.



Physical skill, physical courage and physical combat have always appealed to youth. Any normal young fellow would prefer a football game to an intercollegiate debate. Scholarship is a good thing, they admit when pushed into a corner, but it doesn't stir up much excitement in the bosom of an eighteen-year-old. He will work for it if he must, but he goes into athletic sports because he wants to. Of course this isn't as it should be, but in this world of erratic mortals we are forced to take things as they are, and struggle along as best we can to make them as they should be.

There was a time when the athlete, especially the football player, was looked upon as a crude, long-haired, unwashed citizen without intellectual or moral ambition. He was scholastically often a flat tire; he was estimated according to weight, as they sell eggs in England, rather than by ability to think. George Ade featured such a character in the *College Widow*. Most institutions during the early development of interest in football have had such men enrolled for a brief season among their student body. They came in September and went back to driving a dray or shoveling cement before Christmas.

Things have changed now. The athlete is the undergraduate idol. He is the big man in college, the god whom the freshmen worship, and to whom the young women offer incense and to whom they write congratulatory notes. Student crowds go wild over the successful athlete. Barricades are necessary to keep them from smothering him with attention at the end of a game, and policemen must needs form about him a bodyguard. He is as well-mannered and well-dressed and has his hair cut as frequently as any man on the campus, and he is seldom if ever in these days accused of pulling any rough stuff at the end of the athletic season. He can't afford to even if he were so inclined, as he usually isn't, for the basket ball season is on as soon as the last football game has been played, and baseball practice begins even while basket ball has the middle stage, and he must keep physically fit, and scholastically in good standing.

He has no time for moral and social dissipations. Besides, he is the most constantly watched man in college. Every movement that he makes is noted, every misstep commented upon, every date retailed about the campus. His movements are as well known in campus circles as the activities of the Prince of Wales in England.

Whatever was the case at one time, it is a fact now that, at least in the Big Ten Conference institutions, the athlete is a good student. The university regulations make it necessary; the conference rules require it, and in the institution with which I am connected the administration has not in twenty years abated in its rigid enforcement of these regulations, no matter what important candidate for membership on the team may have been involved. Last autumn, a very valuable man in football was scholastically ineligible, and one in basket ball last season. There were pleas from friends and interested fans to do something for the athletic salvation of these two candidates, but both the coaches and the administration stood pat, and the men were out for the season.

The student who would be an athlete learns he cannot afford to loaf.

In these days it takes more than brawn to be an athlete. The bonehead, no matter how much he weighs, seldom lasts long. Judgment, alertness of mind, quick decision, are required for athletic success. It is not true any more that only the husky man has any show in athletics. It is not surprising, then, that the athlete in general is a good student and by that I mean that the scholastic average of the athletic teams of the University of Illinois, for illustration, is higher if we consider a period of five years than is the general average of all undergraduates.

This is true for more reasons than one. To be eligible for membership upon any college team participating in intercollegiate games in the Big Ten Conference, for illustration, a student must have carried a year's college work without failure, and his grades must have been sufficiently high to keep him off probation. Most men play for the love of the game quite as much as for the love of the college, so they take no chances. They keep their grades safely above the danger line so that there may be no doubt as to their eligibility.

'Better try ping-pong or croquet.'

The athlete wants to be popular too, and he could not possibly be if through loafing or neglect or dissipation he allowed himself to fall by the wayside. The student body will forgive any dereliction more quickly than they will overlook the failure of the popular and successful athlete to keep himself eligible.

Ninety-one per cent of the athletes registered in the University of Illinois expressed a church preference. Seventy-eight per cent are church members, and much of the active undergraduate religious work of our University community is directed by athletes. This year's captain of the track

;eam is at the same time president of one of the large societies of young people of a local church. The captain of last year's football team was one of the active officers of the Young Men's Christian Association. Scores of similar illustrations could be given.

The moral character of the athlete was never before so high as at the present time. The student who would be an athlete, then, learns first of all that if he would keep up his studies and not neglect his athletic training he has little time to waste; if he would succeed he must learn concentration, he must utilize every available minute.

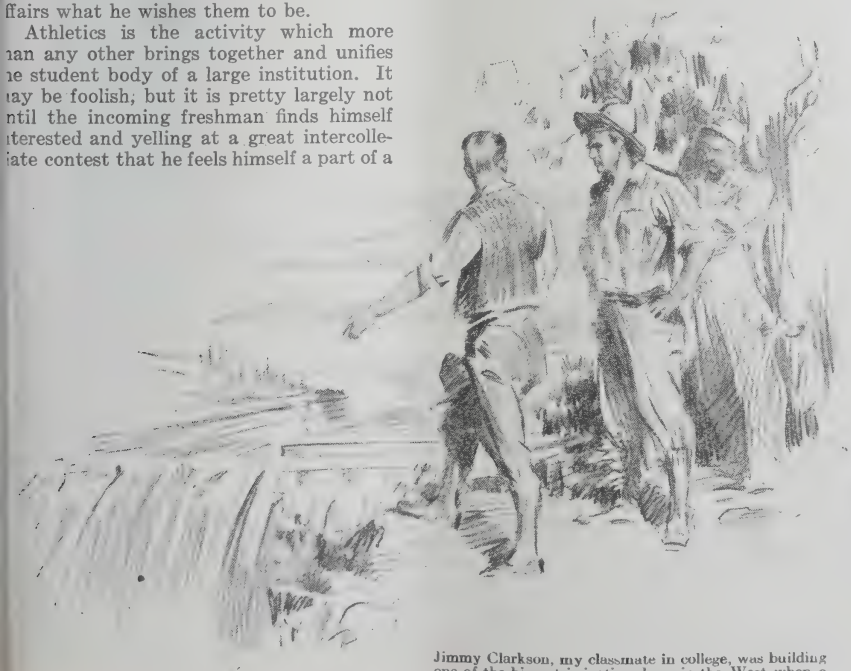
He learns to get his lessons during the vacant hours of the day; he knows that when he comes in at night, tired and sore, he cannot afford to loaf much after dinner or to let his mind wander when he gets at his books. He will grow sleepy early in the evening from exhaustion, and if he is to be alert and fresh the next day he must get to bed soon. All this, if he is wise, teaches him some of the most valuable lessons he can learn in college, and through his example teaches a great many others—the value of concentration and the value of utilizing his spare hours—and these lessons are valuable not only during his undergraduate days but immeasurably more so when he gets out of college into the more trying and strenuous work of life.

*Athlete Is a Great Moral Force*

It is very rare indeed in these days for a college athlete to be found either drunken or dissolute. He knows very well that he has little chance in the stiff competition there is for every position on every team unless he keeps his brain clear and his body clean. He seldom has to be put under forced training; his own desire to excel keeps him free from excesses and finds him coiling ahead along the straight and narrow path.

All this makes the athlete a great moral force upon any campus. He has more influence than the dean. He can establish a tradition or do away with one or put an end to a student outbreak by speaking a word or by raising a hand. If he realizes this responsibility and uses his power to advantage he can almost make undergraduate affairs what he wishes them to be.

Athletics is the activity which more than any other brings together and unifies the student body of a large institution. It may be foolish, but it is pretty largely not until the incoming freshman finds himself interested and yelling at a great intercollegiate contest that he feels himself a part of a great institution. Previous to this time he has been on the outside, as it were, but now he thrills with the consciousness that the college is his.



'The athletic hero is only a short-lived hero,' a newspaper editor wrote not long ago. 'He must step down from his pedestal as soon as he leaves college, and what he has learned while playing his game will be of little or no use to him when he takes up the real work of life. It may even be a detriment in that his having been the center of attention and adulation for so long will have given him a false estimate of himself.'

The man who argues thus has known very little of the discipline and the training which the athlete receives, nor has he given any serious attention to the effect which that training has upon the man's later life.

I have in mind now a young fellow who is graduating from college this coming June. He is not a quick thinker; what he gets he gets from regular application and hard study. It was his great ambition even before he entered college some day to make the football team. He went out to the first practice in his freshman year. He was not thought good enough to make the freshman team, but he appeared for spring practice just the same. And so on in his sophomore year and his junior year and his senior year, but he always ended up with the scrubs. Even his best friends tried to discourage him.

'Better give it up and try ping-pong or croquet,' they would say when he came in from practice late for dinner. But he only set his jaw harder, and kept at it.

He worked hard at his studies and kept them up in good shape throughout the four years; he took his punishment in the nightly scrimmage without whimpering; he sat on the side lines during the games without complaint; he met disappointment and bodily weariness and defeat with a renewed determination ultimately to get his chance. It was in the last game of the season in his senior year that that chance came. In the last few minutes of play he was put in as a substitute, and it was his work which really won the game.

Jimmy Clarkson, my classmate in college, was building one of the biggest irrigation dams in the West when a flood washed out all his work.

You can't make me believe that those four years of struggle and work and daily discipline, that the persistence and determination which this man showed in the face of discouragement and disappointment and constant defeat and the final success which he won will not have its effect upon his work for all the years to come. You couldn't discourage a man like that, no matter in what business he was engaged. He couldn't fail permanently, for even if he were down he would be up and at it again the next moment.

Jimmy Clarkson, my classmate in college, was an engineer and a member of the baseball team. We had some pretty stiff contests with Michigan even in those far-away days, and Jimmy always held that the game was never lost until it was ended. Even if it was the last half of the last inning with the opponents one run ahead, two men out and the umpire holding up his hands to indicate that two strikes and three balls had been called on the man at bat, Jimmy never lost hope; and sometimes, by a lucky strike, his hopes were realized.

*Made a Home Run Next Time*

It has been the same way with his work as engineer. He was building one of the biggest irrigation dams in the West when a flood came and washed out all his work and he awoke one morning to find everything gone and himself one hundred and fifty thousand dollars in the hole.

'Well, it's only two strikes and three balls,' he said to himself, 'and I'll make a home run the next time'; and he did, and the dam stands today completed as the result of the fighting spirit which Jimmy learned on the baseball field.

I have studied for more than thirty years the careers of our athletic students after they have graduated and gone out of college, and I am convinced that a man carries the benefits of athletic training into the work which he takes up after he leaves college. The college athlete is a fighter. He has been trained to meet difficulties; he is not afraid to tackle a hard job, and he is not discouraged if he does not at once succeed. He sticks with more tenacity; he has more physical endurance and so can stand hardships, and nervous strain, and long hours of work. He has developed concentration and has learned how to work with others. The effect which his athletic training has had upon his body, his mind, and his character, all conduce to energy, judgment, and self-reliance, and so make for success. He is likely to get on faster and to go farther than men of similar ability who have not had his training.

Whatever can be done by colleges to interest students generally in athletics is desirable, but such interest is not decreased by the development of strong athletic teams. Athletic training is worth all that it costs to the college and to the student while he is in college and after he has graduated in the development of character, in discipline, in college loyalty, and in the binding together of the students as a whole.

*THE Reverend Arthur W. Brooks believes there is a far greater field for astrology than is usually conceded. He has tested the science over a period of years. In next week's issue he will discuss the portents for the next ten years as he sees them.*

# Robert Frost

(Continued from page 2)

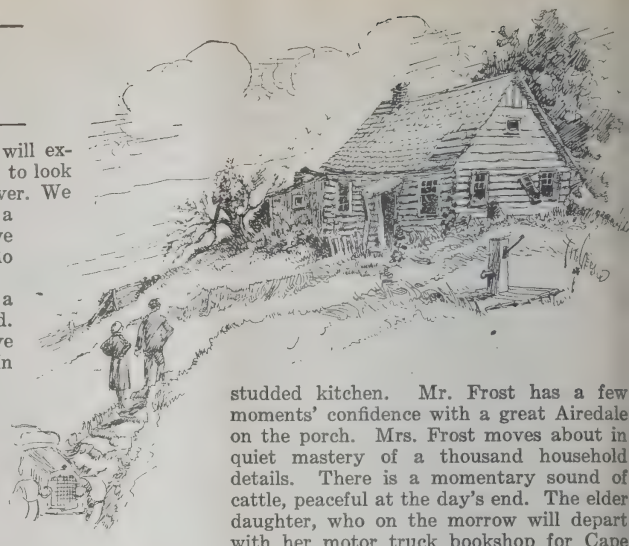
not without honor, save in his own country,' because he had to know himself, for twenty years, that he was a poet before he could convince others of the fact.

In 1913 his first volume, *A Boy's Will*, was brought out by a London publisher. Economically the little family was not very secure. For a while they lived in Buckinghamshire and then, in 1914, a combination of poverty and the passion for a farm that had flared bright again led them to lease a tiny farm in Gloucestershire. England was liking *A Boy's Will*. In 1914 *North of Boston* appeared. It sold in England like a popular novel. Things became propitious for the Frosts to return to America and, ironically enough, they found upon their arrival that its literary circles were drawn up in heartening ranks to bid them welcome, to shower upon the poet a tardy but vociferous applause. The applause fooled Frost as little as did the neglect. In 1916 *Mountain Interval* was published and in 1923 *New Hampshire*. And Robert Frost returned to the upper New England, which had gravely watched his pitiful,

early struggles, and there established a homestead for his family. He was appointed to a post in the English department at Amherst College, but he must have a farm, partly for his son to work, and partly to satisfy the hunger within him which would be satisfied in no other way. And from his farm he made the round of universities and colleges, going twice for a year of residence to the University of Michigan, where his fame and following are both growing.

All these ingredients, then, undoubtedly had a share in the inauguration of this recreation of buying farms.

Men do not bring up families of four children upon a poet's meager earnings and have much left over for indulging fancies. So it was that Mr. Frost would explain, with a gleam of merriment in his eyes: 'Ah—now about buying these farms. We must explain to you. A few, very few we buy with money. But mostly we buy them with conversation.' And, bumping wildly up hills of ominous grade, and down wood roads hewn none too clearly out of Vermont rock, you learn that this curious diversion of buying farms with conversation is conducted thus. One member of the family will suddenly have a view of sweeping valley, squared with corn and potato fields and with a striated pattern of vegetable gardens, where a single farmhouse and its outbuildings are lone testimony to human habitation, and will exclaim: 'There! I want to look down on that scene forever. We must see if there is not a house up here that we can buy so I may do so.'



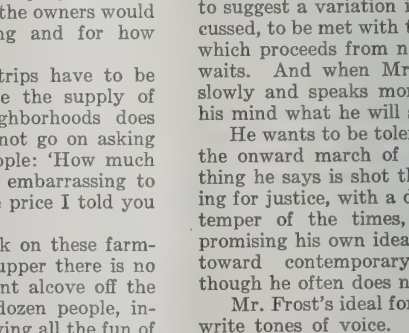
And presently such a house will be found. Sometimes it will have been abandoned. In which case it will be half hidden in a tangle of tall grass interspersed with berry bushes that have run to wood, with an old mulberry tree and the remains of a once proud garden of hollyhocks to stand guard over the decline of its splendor. On the other hand sometimes a farmhouse will be found, trim and weathered to silver, either side of its narrow front walk flanked with neat round beds of portulaca and petunias, and its modest front door guarded by serried ranks of golden glow or sunflowers. The motor will halt, thus providing fortunate opportunity for the boiling radiator to recover its equanimity, and all the occupants of the car will fall to discussing the remodeling of the house to suit the needs of the Frosts. How much will it cost to restore the old well sweep? Which room will be best to use for a living room? How wide can the sleeping porch be made?

If the farmhouse is occupied, some inquiry is made as to whether the owners would consider selling and for how much.

Each year, now, the trips have to be longer and longer because the supply of farms in the nearer neighborhoods does not hold out and one cannot go on asking too often of the same people: 'How much would you ask?' for it is embarrassing to have them say: 'The same price I told you the last time.'

There is no serious talk on these farm-buying expeditions. At supper there is no serious talk, in the pleasant alcove off the living room where some dozen people, including the son who is 'having all the fun of being the farmer while I do the heavy looking on,' as Mr. Frost says, sit about a long, oval table and eat an old-fashioned country supper, with casual passing back and forth of plates, and the sun, westering in a welter of lemon and fuchsia and purple over the hills striking answering shafts of color from a bowl of giant sweet peas in the center of the table.

One by one the family saunters away after the light clatter of dishwashing is done in the low-



studded kitchen. Mr. Frost has a few moments' confidence with a great Airedale on the porch. Mrs. Frost moves about in quiet mastery of a thousand household details. There is a momentary sound of cattle, peaceful at the day's end. The elder daughter, who on the morrow will depart with her motor truck bookshop for Cape Cod, where she will sell Galsworthy and Dickens, Canfield and Kilmer, Browning and Dos Passos, Canby and Squire, Longfellow and Millay to folk by the side of the road, goes upstairs to write letters. 'But don't go to bed,' her father cautions, 'because I've scarcely seen you since you came and you're going away and we never get talked up anyway, so let's have a word or two later.'

When Mr. Frost has ceased his confidences with the dog, a chair is dragged over the painted floor to a position just beyond the arc of the lamp. He flings one leg over its arm, takes a shining steel knitting needle from his wife's ball of sulphur yarn to play with and use to dig a hole in the arm of the chair, and says: 'Now we can talk.'

We do not talk. Robert Frost talks. Sometimes for as much as ten minutes there is no sound in the room but the tick of the clock and the singing tinkle of the water. Having tried at first to amplify a question or to suggest a variation in the idea being discussed, to be met with the failure to respond which proceeds from not having heard, one waits. And when Mr. Frost, who thinks slowly and speaks more slowly, makes up his mind what he will say he says it.

He wants to be tolerant of everything in the onward march of civilization. Everything he says is shot through with a yearning for justice, with a desire to perceive the temper of the times, and without compromising his own ideals to be sympathetic toward contemporary influences even though he often does not understand them.

Mr. Frost's ideal for his own poetry is to write tones of voice. He smiles, the rare, slow smile, when he says this, expecting, gleefully, that he will be asked: 'But how in the world can you write tones of voice?' 'I have,' he says, 'wanted to write down the brute, throat noises so that none could miss them in my sentences, so they would double the meaning of my sentences. Poetry is gloating over the things of this world, observation, listening, then setting down the sounds by

means of the context. "Talk songs," I call them sometimes. I am not trying anything new. It's as old as Chaucer only we haven't talked about it very much. Longfellow wrote "The Flight Into Egypt." In it you will find a whole span of dramatic sound and vocal imagination. The sweet, gentle words of Mary, the gruffness of Joseph, the bluster of the two thieves, the thin piping of the infant Jesus. It is just a simple miracle play, but as perfect, as exquisitely molded as poem ever was.

'You know, I often think the stuff we hear called "Imagery" is wholly empty of tones of voice. I suppose it is designed to make you see sparks, flashes, colors. But to me vocal images are varieties in the saying of words. I think one of the troubles with contemporary poetry is that our poets, many of them, are metaphor crackers. They crack metaphors as other people crack jokes. And when they have cracked a pageful they knock off until the next day.

'I am not thinking that the only literature is the literature of the past. I suppose it is because of the potentialities that I am so keen over what I call my theory of "education by presence." The most impressive thing in a college career is, often, having over one someone who means something, isn't it? Students get most from professors who have marked wide horizons. If a teacher is evidently a power, outside as well as inside the college, one about whom you can hear along the highways, then that teacher is of deep potential value to the students and they may be expected, later, to do things. To the student who discovers that his teacher is known all over the country for something gifted, his communications take on luster. The business of the teacher is to challenge his students' purpose. "This is your life, your career is ahead of you," he must say. "Now what are you going to do about it? Something large or small?"

'I do not mean that the challenge should be made in words. That, I should think, is nearly fruitless. It must soon begin to sound to the students like rote. Besides, a man can't be forever standing about on the campus crying out, "What are you going to do about it?" His work must cry it for him.

'My greatest inspiration, as a student, was a man whose classes I never attended. The book which influenced me most was *Piers Plowman*, yet I never read it. When I realized how much the book had influenced me I felt I should read it. But after considering I decided not to, fearing it would not be what I had thought when I started out to do what I have since done, what an unread book inspired me to do.

'Everyone, I think, knows that there is such a thing as education by presence. I won't quiz day after day. I won't ask boys questions to which I know the answer. Three days a week, thirty-five weeks in the year is three times as much as I have it in me to lecture on any subject anyway. I am an indifferent teacher as teachers go. I have written four books. I expect to write four more. These books, the unwritten as much as the written, are what I am to the college. If teaching is, as I say, asking rather than answering questions, my books do most of mine with very little help from me.

'There are three ways of teaching. There is formal contact in the classroom. There is informal contact, teaching socially, as it were. And there is teaching by virtually no contact at all. I have always thought a man's chief strength came after being able to say (after St. Paul and Kipling) "Of no mean city am I—of no mean college am I"—speaking intellectually. It must mean something to the student to be aware of distinguished research scholars around him. I am helped by the thought of the artists around me who are my fellow citizens. It encourages me to belong in the same circle with people who see life large.

'The teacher who has contacts which are but informal, extra-class, so to say, fills a spacious place in the student need. Perfect informality of contact is in offering oneself as someone to whom the student may like showing his work. The college could be partly built, in the upper tier, of teachers who offered themselves or were offered thus. By "upper tier" I mean a few of the teachers could be offered wholly this way and all the teachers more or less. Each teacher should have his time arranged to permit

# GIVE YOUR YOUNGSTERS AN ADVENTURE LAND VACATION

# Glacier National Park

*Open June 15th to September 15th*

UNCLE SAM has made citizens of the Indians. The old tribal costumes and customs will soon be no more. Now, before it all goes, let your children get acquainted with the noble, unconquerable Blackfeet. Today, as for centuries past, Glacier National Park is their native home.

Come out this summer. There's health for you in this lake-jeweled Rocky Mountain million acres. Hike, climb, ride horseback, fish. Tour about in motor coaches or motor launches. Camp in the open. Or live in ease at the fine hotels or rustic chalets.

You can ride right up to the gates of Glacier Park on the luxurious New Oriental Limited or other fine Great Northern trains operating between Chicago and the Pacific Northwest. Low Summer Fares to Glacier Park, the Pacific Northwest and Alaska. Today send the coupon for full details.

freer informal contacts with students. Art, the sciences, research, lend themselves to such a plan. You could perfectly well build a college on informal contacts. I'd give every teacher who wanted it, who could be happy in it, who wouldn't despise it, a chance at this informal teaching. Some more, some less.

'Half the time I don't know whether students are in my classes or not. On the other hand, I can stay with a student all night if I can get among his realities. Courses should be the introduction to give students a claim on me. Then if the student does not want to press his claim, I suppose he must have an examination. I believe in a wide-open educational system for the freeborn. "Those who will, may" for the freeborn; "Those who won't, must" for the slaves. All the freeborn asks of his teacher is the happiness of being left to his own initiative. That is more of a tax on the ego of the teacher than upon his time.

*Believes in Wide-Open Education*

'Then there is formal classroom teaching. The essential symposium. Heaps of ideas, with books incidental. Rooms crowded with students who want to talk and talk and talk, to suggest things to me I never thought of. It is like the heaping up of all the children's hands, all the family's hands, on the parental knee in the game we used to play by the fireside.'

Mr. Frost, who has happily pursued this educational idea at Michigan, would talk of poetic drama tentatively, and he thinks people should discuss it more. 'I wrote a play once,' he said. 'I am always on the verge of drama. Something happened before my play was produced. Things often happen before plays we think the world is waiting for can be produced.

'The ingredients for poetic drama? Shakespeare first of all. When I think of the successful poetic drama I think of the speaking passages of Shakespeare. The lean, sharp sentences. The give and take, the thread of thought and action not lost in metaphor and adjective. The field of poetic drama need not, I think, be limited any more than the field of poetry. I should not at all mind seeing someone make poetic drama out of Mr. Coolidge and the White House . . .' The poet's eyes narrowed with hidden laughter and it was impossible to tell whether he was serious or not.

*The Farmhouse Behind a Fan of Maples*

'I prefer that the poetic drama shall be idyllic. I am wearied of problem plays. I am thinking of plays it would be nice to do . . . Yes . . . Let me see . . . I see it taking shape . . . A little . . . Not much . . . The chief character could be a house . . . With the play to turn on the reaction of people to the state in which they have found the house . . . That little house, scene after scene, with its intimate meaning to all those people the dominant note . . . Yes . . . very amusing . . . I must think if I shall try it one day . . .'

The room had grown a little chill. The oil in the lamp had diminished. The air was dulled. The trickling water kept up its silver song. The topaz lights away in the hills winked watchfully . . . And who could tell but that the house about which Robert Frost would build his poetic drama was the farmhouse, set behind a fan of giant maples and nearly two centuries old, of which he had said that afternoon: 'Oh we have already bought that with conversation. We mustn't stop now, but some day we may buy it with money . . .'

# The Alcotts—As I Knew Them

(*Concluded from page 18*)

cated it approvingly, while breaking off another fragment. Mrs. Alcott wanted to interfere, but we suppressed her.

The lecture went on and the cake gradually disappeared; with eyes still fixed on the ideal, he cut a fresh supply and benignly devoured it, but neither the theme nor the cake being yet finished, he continued to talk, eat and draw upon the remains—bringing the platter close to himself for convenience—until all was gone; he even disposed of the crumbs. Then he said, smiling gently upon his audience, 'But I must be getting back to my work,' rose from his chair and retreated, leaving us to our sensations.

We had lost the cake, but the cause was worth the sacrifice. Had Mr. Alcott been capable of a sense of humor, the joke would have been on us; but the dear innocent had a vacuum in the place ordinarily occupied by that organ. Mrs. Alcott feared acute indigestion, and spoke of an emetic, but we reminded her of the *vis medicatrix naturae;* and in fact, when Una and I went over next morning to inquire, Mrs. Alcott admitted that her husband had never enjoyed more tranquil sleep. Una took credit to herself for having afforded him the solitary pleasure of the palate that he had ever known, and for aught we know the riot of unsuspected evil may have prolonged his beneficent existence. But his wife took care that bride's-cake never again came within his reach; we can only hope that in heaven he found such delicacies both abundant and harmless. The anecdote has a deep moral.

*His Best Aid to Literature*

Some satirist, reading *Little Women* and recalling the 'Orphic Sayings' in *The Dial,* remarked that Louisa Alcott was her father's best contribution to literature. The sage might have agreed, for he had no personal vanity, and he loved his daughters; but he crowned himself with a brighter laurel when he let her go to the front in the Civil War to nurse the wounded. There for many months the girl witnessed human agony and death in every form, and was the tender confidante of hundreds of souls soon to forsake their tortured bodies.

Thousands of our women, born long after Louisa died, know what her experience was; its effect upon her was profound and lasting, and she herself lay at death's door for months from fever contracted in the face of battle. In her first young womanhood she had overflowed with wit and humor and high spirits; no festival was complete without her; she was fertile of merry suggestions, and ready to take upon her shoulders all the hard work that might be involved in carrying them out. She rode and swam and danced and told stories and acted in little dramas that she had composed, or often had adapted from some chapter of her favorite novelist, Charles Dickens. As Sairy Gamp and Betsy Prig she and her sister Ann rose to real heights of comedy. Life gushed up in her like a fountain; her dark eyes shone, and the great mass of her black hair broke from its fastenings and flowed over her shoulders. She was a natural leader among us.

But after she was brought home from the war, and lay for a long time balancing between life and death, with the memory of her terrible days haunting her, and she a hollow-eyed and almost fleshless wreck of the Louisa we had known and loved—after her slow convalescence, climbing painfully out of the grave to life, she was not the same girl who had left us a year before. During the twenty years of her literary activity that followed, she remained as it were behind a veil; occasionally it would slip aside for a while, and a flash of humor or a shaft of wit come out of the shadow; and the influence upon her writing was manifestly to mellow and deepen it; she could not have touched a million hearts except from the depths of her own. But the price she paid was great.

Her success was immediate, and entirely a surprise to her. Hawthorne called himself in one of his early prefaces 'the obscurest man of letters in America.' Alcott could have contended with him for that distinction, but he was the father of the most popular woman author that America has produced: *The Scarlet Letter* won fame, but never had a tithe of the readers of *Little Women.* The sale of the book rescued the family from real poverty, and Louisa, who had a romantic imagination and longed to write tales of wild passion and adventure, had the judgment and self-control to continue the simple and homely vein in which she had begun. Volume followed volume, and the family never lacked the comforts of life afterward.

When I, after many years in Europe, happened to meet her on the shore of Buzzard's Bay, we conversed long and unreservedly. At moments she was the young Louisa whose madcap frolics I had joined in Concord; again, shadows came over her face that made it eloquent but sad. She had seen, and overcome, and yielded, and believed; her father's orphic wisdom had been transmuted in her to a finer and more human gold. She made no claim to have solved the Secret of the Sphinx, but was content to do what she could to increase mortal happiness. When she and the sage met in heaven, he may have realized that in her he had builded better than he knew.

The Concord people, before Alcott's death, had erected on the hillside behind Apple-Slump a modest little frame building which they called the School of Philosophy. Emerson had already left us, but his spirit and Alcott's presided over the place, Alcott's still for a while habited in the flesh. High themes were debated there by the best minds of the time, and the audiences were devout. Frank Sanborn, once the schoolmaster, now retired to a learned seclusion, was commonly the manager of the gatherings, and a fount of valuable information about former times and persons; his abundant hair was now nearly white, but as abundant as ever; his shoulders stooped a little more, and he was smiling and genial; but I could still see in him the tall pedagogue of whom I had stood in awe thirty years before.

*Sanborn the Schoolmaster*

Ellery Channing sometimes attended for a while; but the old order had changed, giving place to new, and God was fulfilling Himself in other ways, lest one good order should corrupt the world. The young and middle-aged persons whom I saw around me were intelligent and interested; sympathetic too; but they had somewhat the air of archeologists.

UNIV OF ILLINOIS
URBANA ILL

IT is to be regretted that the rich and powerful too often bend the acts of government to their selfish purposes. Distinctions in society will always exist under every just government. Equality of talents, of education, or of wealth cannot be produced by human institutions. In the full enjoyment of the gifts of heaven and the fruits of superior industry, economy, and virtue, every man is equally entitled to protection by law; but when the laws undertake to add to these natural and just advantages artificial distinctions, to grant title, gratuities, and exclusive privileges, to make the rich richer and the potent more powerful, the humble members of society — the farmers, mechanics and laborers —who have neither the time nor the means of securing like favors to themselves, have a right to complain of the injustice of their Government. There are no necessary evils in government. Its evils exist only in its abuses. If it would confine itself to equal protection, and, as Heaven does its rains, shower its favors alike on the high and the low, the rich and the poor, it would be an unqualified blessing.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the apparent increase in the number of young men who choose engineering as a career

Independence Day. On the cover, Independence Hall. It was not a 'scrap of paper' that was signed in that historic Pennsylvania State House one hot July day, 150 years ago. The First Fourth of July was a pretty serious day. Gerald Van der Heyden has caught in his picture the spirit of the place.

The Declaration of Independence did not make America free. *It only expressed the will of the people to BE free.* Actual independence was not obtained so easily as by the signing of a paper. It cost years of war, wounds, death. This year marks the 150th year of American freedom —a new kind of freedom in the story of mankind. (p. 2)

Somebody blundered. General Howe was to march north from New York as Burgoyne came down from Canada; together they were to act as a vise and crush the American forces between them. But somebody blundered. Howe marched off to Philadelphia, leaving Burgoyne to meet his fate alone at Saratoga—one of the fifteen decisive battles of the world. (p. 6)

The English blamed Burgoyne. But letters, recently discovered and here printed for the first time, exonerate him. His plight was desperate. Promised aid failed to come. And at the crucial moment, a seemingly meaningless message came from Clinton, which has puzzled historians for a century and a half. It was in mask code; it is here deciphered. Here is an absorbing bit of history written for the first time. (p. 6)

Another event of the Revolution has never found its proper place in history—Caesar Rodney's heroic ride for the cause of liberty. Rodney's vote was needed if the Colonies were to adopt the Declaration of Independence. But Rodney was home, dangerously ill. (p. 16)

Time plays strange pranks. A signature of Button Gwinnett, an obscure Signer of the Declaration of Independence (ever hear of him before?) is worth more than one of George Washington, because rarer. This story conveys the fascination of collecting the autographs of the Signers. (p. 25)

What's in the immediate future of the Republic? The next fifteen years will see—another war or series of revolutions in Europe that will smash present systems and change the map radically. Militaristic dictators in power. Vast commercial mergers, development and expansion. Progress in science and literature. A crisis in America which may lead to war. Financial slumps, followed by reconstruction and prosperity. Far-reaching social, religious and economic reforms—

These are the predictions of the Reverend Arthur W. Brooks, Episcopal clergyman and astrologer. He has read what the stars portend for the next decade or so. He has read the horoscope of the Declaration of Independence. Many will be interested in this article. (p. 12)

Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

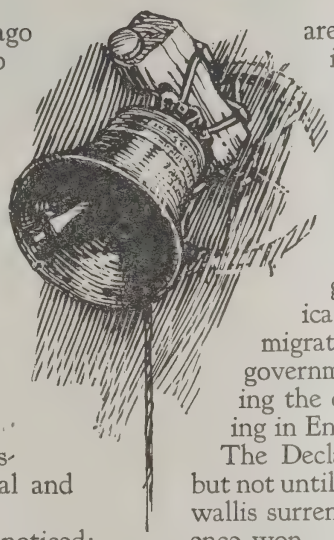
President Coolidge is at last beginning to realize that the World Court is *not* popular in America. Movie audiences and primary voters are making him think. They applaud Borah but not Coolidge, and pro-Court Senators go down to defeat. The President had good cause to remark recently that he 'had no idea' there was so much sentiment against the World Court. (p. 4)

America has no place in the World Court. We are not willing to let European nations, most of them unfriendly to us, tell us when we shall go to war. Our vote in the Court would bring us more enemies than friends. America—Allan L. Benson points out in this article—can do far more toward maintaining world peace *outside* the Court than *inside*. (p. 4)

Congress decreed better babies—by law. It was done at the demand of professional welfare workers and uplift lobbyists. Congress appropriated money and established bureaus and set elaborate machinery in motion. All of which was to result in bigger and better babies. This was five years ago, and the promised benefits are not yet apparent. Aaron Hardy Ulm analyzes the situation. (p. 3)

There are several versions of Lincoln's 'Gettysburg Address.' Dr. William E. Barton, famous Lincoln biographer, explains why. The speech was revised once or twice before its delivery, and at least once afterward. Then in giving the address, Lincoln varied slightly from his prepared copy. (p. 8)

Then there is an article on the Delaware River bridge, largest suspension bridge in the world, which is scheduled to open this week . . . and one on the Statue of Liberty . . . And the dance article this week is of special interest. It contains a dictionary of terms you will be sure to find useful.



In Chats With Office Callers you will find frank discussions of important topics. The people quoted are, for the most part, national figures. As their names are never revealed, they can be as frank as they please, and oftentimes they talk on subjects they would otherwise avoid.

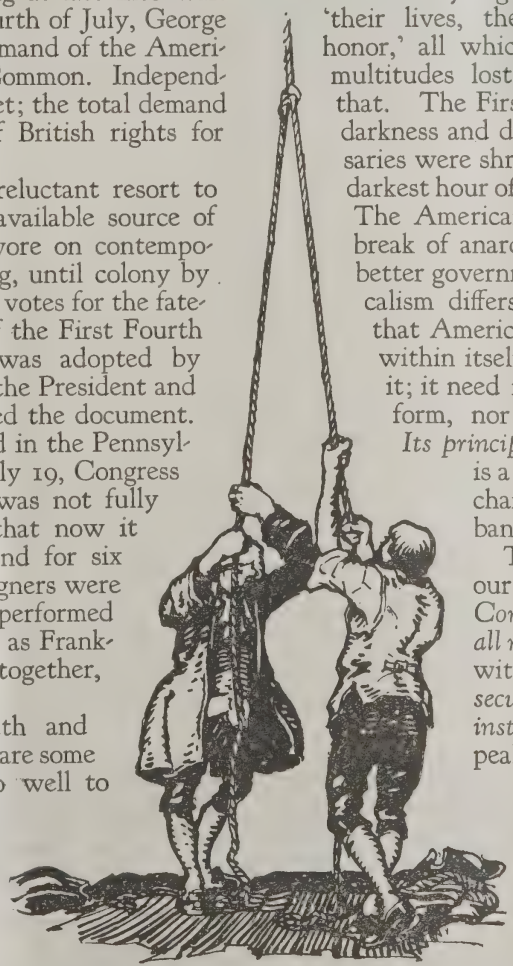
Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879.

# The First Fourth of July

A CENTURY and a half ago American hands were set to the one irrevocable document of our national history. The Constitution may be amended, but not that. Laws may be repealed, but never that. Unchangeable as a force of nature the Declaration of Independence stands, ancient in its terms, contemporary with every phase of modern progress in its spirit.

It was not the work of Thomas Jefferson; he wrote what the towns and farms were saying; their thought informed his words. The Constitution was the work of lawyers and statesmen, but the Declaration was national and popular in its origin.

The First Fourth of July passed unnoticed; no one knew that it was the Fourth of July. The land was shrouded in deep anxiety. A struggle between government and people had existed for years, deepening at last into war. A year before the First Fourth of July, George Washington had taken command of the American Army on Cambridge Common. Independence was not the issue as yet; the total demand was the reasonable one of British rights for British citizens.



Events compelled the reluctant resort to Independence as the sole available source of political justice. Debate wore on contemporaneously with the fighting, until colony by colony, save one, gave their votes for the fateful step. In the evening of the First Fourth of July the Declaration was adopted by twelve States. On July 5, the President and Secretary of Congress signed the document. On July 6, it was published in the Pennsylvania *Evening Post*. On July 19, Congress ordered it engrossed. It was not fully signed by all the names that now it bears until August 2. And for six months the names of the Signers were kept secret, for they had performed an act of high treason, and, as Franklin said, 'Unless we hang together, we shall hang separately.'

On this one hundredth and fiftieth Fourth of July there are some things which we shall do well to consider concerning that First Fourth of July.

For one: a declaration of independence can only come from people who are already independent in their thinking. Our fathers were independent before they even thought of independence in the political sense. Van Tyne truly says 'the English kings planted the seeds of the Revolution when, in their zeal to get America colonized, they had granted such political and religious privileges as tempted the radicals and dissenters of the time to migrate to America . . . The English government had systematically been stocking the colonies with dissenters and retaining in England the conformers.

The Declaration was adopted July 4, 1776, but not until October 19, 1781, when Lord Cornwallis surrendered was the War of Independence won. The Declaration was but the announcement of conviction, it was not possession of the boon. The Thirteen Colonies struggled thirteen years to possess what they declared to be theirs by right. The Declaration involved 'their lives, their fortunes and their sacred honor,' all which they staked, and all which multitudes lost, save honor, and some even that. The First Fourth of July was a day of darkness and doubt, and its successor anniversaries were shrouded in gloom, until out of the darkest hour of despair light suddenly dawned.

The American Revolution was not an outbreak of anarchy. It was the opposition of better government to worse. American radicalism differs from other forms extant in that Americanism knows that it possesses within itself the cure of the ills that harass it; it need not destroy itself to effect reform, nor wreck itself to right its keel. *Its principles leave Liberty free*, for there is a radicalism that binds Liberty in chains, and in the name of principle banishes principle from the field.

The First Fourth of July saw our revolutionary radical fathers *in Congress assembled*, holding that *all men are endowed by their Creator* with unalienable rights, that *to secure these rights, governments are instituted among men*, and appealing to the *Supreme Judge of the world* for the rectitude of their intentions they set up such a government for the securing of such rights. That Government still stands and those rights are still secure.

# Uncle Sam and the Baby Crop

## Four Years' Nationalization of the Nursery Brings Indifferent Results

By AARON HARDY ULM

FIVE years ago there raged off and on for a period of twelve months or more a singular national controversy. It was about—among other things—babies. The question was as to how far the Federal Government properly might go in looking after the 'baby crop,' in the manner somewhat of its display of concern for the corn, cotton or pig crop. The storm was quieted with the oils of compromise and postponement. So the question is up again, and before this is published the matter may be disposed of again, for the time being, in a like temporizing way

Congress temporizes with the subject because a bigger problem underlying the baby controversy is in something like a state of suspense. This bigger problem is, broadly, federalization, or the Government's tendency, far-running in recent years, to bring within its supervision more and more of the nation's life.

That tendency was running at its highest when Congress was last torn, in 1921, by the baby controversy. During the preceding ten years Congress had injected a directing hand into many state and local affairs. It did this usually by offering funds to the states in return for the right to say what the states should do in designated quarters.

*Prerogatives Were Sold for Cash*

'You may have this money,' the Federal Government said, 'only by putting up an equal sum for the purposes in point and agreeing for all to be spent under the supervision of bureaus in Washington.' By this easy process such obstacles as Constitutional guaranties of certain prerogatives to the states or the people could be overcome. The states surrendered prerogatives in return for cash—for money paid into the Federal Treasury by their own citizens and thus returned to them in the form veritably of—bribes!

Most of these adventures had to do with things—such as corn and cotton and pigs. Then came the demand that they comprehend people, even motherhood and childhood. The demand was expressed in the so-called Maternity Bill, which was backed by the United States Children's Bureau and militant feminine groups.

In its original form the proposal was, presumably, for an operation in perpetuity, in the manner of most of the 'fifty-fifty' ones by which the Federal Government supplants or coerces the states. There was to be a beginning appropriation of $4,000,000 a year from the Federal Treasury for 'the promotion of the welfare and hygiene of maternity and infancy.' Most of it was to go to the states, or those that would agree to 'match' the sums received, and to submit plans for the sending of all to the Children's Bureau for approval.

An outcry arose against the proposal, on the ground that it was a revolutionary venture in Federal bureaucracy. Congress hearkened to the extent of reducing the appropriation to $1,240,000 a year and putting upon the operation a five-year limitation as to time. Congress also wrote into the act a prohibition against any of the 'services' to be thus rendered to motherhood and infancy being imposed on anyone who might protest. The original bill provided for the rendering of 'free' medical services where needed, a provision that would have given much leeway to those administering the act. This part was eliminated.

*Various Changes Were Made*

The measure as originally enacted will expire on June 30, 1927. Its original proponents urged that it be continued beyond that date. They asked specifically for a continuance of only two years, which was voted by the present House of Representatives. The Senate committee, which passed on the subject, recommended a continuance for only one year. Chief proponents of the measure intimate that if the operation goes on, further continuances will be asked. The hope of many of them no doubt is that it become perpetual, as was originally advocated by them.

Hence, unless Congress refuses to grant any continuance, the subject will be left in suspense, with the probabilities favoring ultimate permanency and elaboration of the project. Such is the lesson to be drawn from the history of similar projects, even that of the Children's Bureau itself.

*Better Hogs But Not Better Babies*

The bureau was set up about fifteen years ago, over protests like those made against the Maternity Act. The argument for the bureau was the same as for this elaboration of its functions. In most sensational form this argument rested on the 'Pigs vs. Babies' comparison.

'The Government spends so many millions for better hogs and nothing for better babies,' said the advocates of the bureau. Opponents countered with the statement that there is vast difference between pigs and babies and that for the Government to meddle with the production of infants might lead to sacred personal rights being invaded.

The Children's Bureau, however, was created, but as a fact-finding and informational body only.

'We shall not be willing to let the establishment of the Children's Bureau mean simply investigation—it must mean power to change things,' said the *Woman Citizen*, the organ of the groups which brought the bureau into existence, not long after the act of establishment was passed.

The purpose of the Maternity Bill was to give the bureau 'power to change things,' among them being ones that are admittedly bad. One of these is a higher maternity death rate that is registered in most civilized countries, another is a higher infant mortality rate than prevails in most countries that are properly comparable with the United States.

Opposition to the establishment of the bureau and later to the Maternity Bill was not on the ground that conditions complained of should not be corrected but on the fear that the thus proposed way of dealing with the problem was faulty and dangerous. Opponents of the Maternity Bill said that to put the bearing and rearing of children under the surveillance of a Washington bureau runs counter to the American principle of individual and local government rights and responsibilities. Senator James A. Reed declared that the measure should have been entitled, 'A bill to authorize a board of spinsters to control maternity and teach the mothers of the country how to raise babies.'

*Machinery of the Maternity Bill*

Advocates of the proposal claimed that the chief purpose was to 'stimulate' State and local activity in the premises—by dangling Federal Treasury funds, with very tangible 'strings' tied to the money, before the states.

Like others of its kind, the measure set up a variegated machine for its own enforcement. The spread between motivation, that is, the Government, and the ostensible objects, that is, mothers and infants who need help, is so elongated, if not so complicated, that it is practically impossible to give a vivid picture of the operation in practice.

Here's a woman, let us say, in Alabama. She is on the way to motherhood, as are around 3,000,000 women in this country at all times. Help for this woman, via the Maternity Act, must trickle, as a rule, through four series of functionaries, as follows:

First—A board *(Concluded on page 23)*

# Movie Patrons Make Coolidge Think

## Borah as Film Favorite Alters President's Visualization of World Court

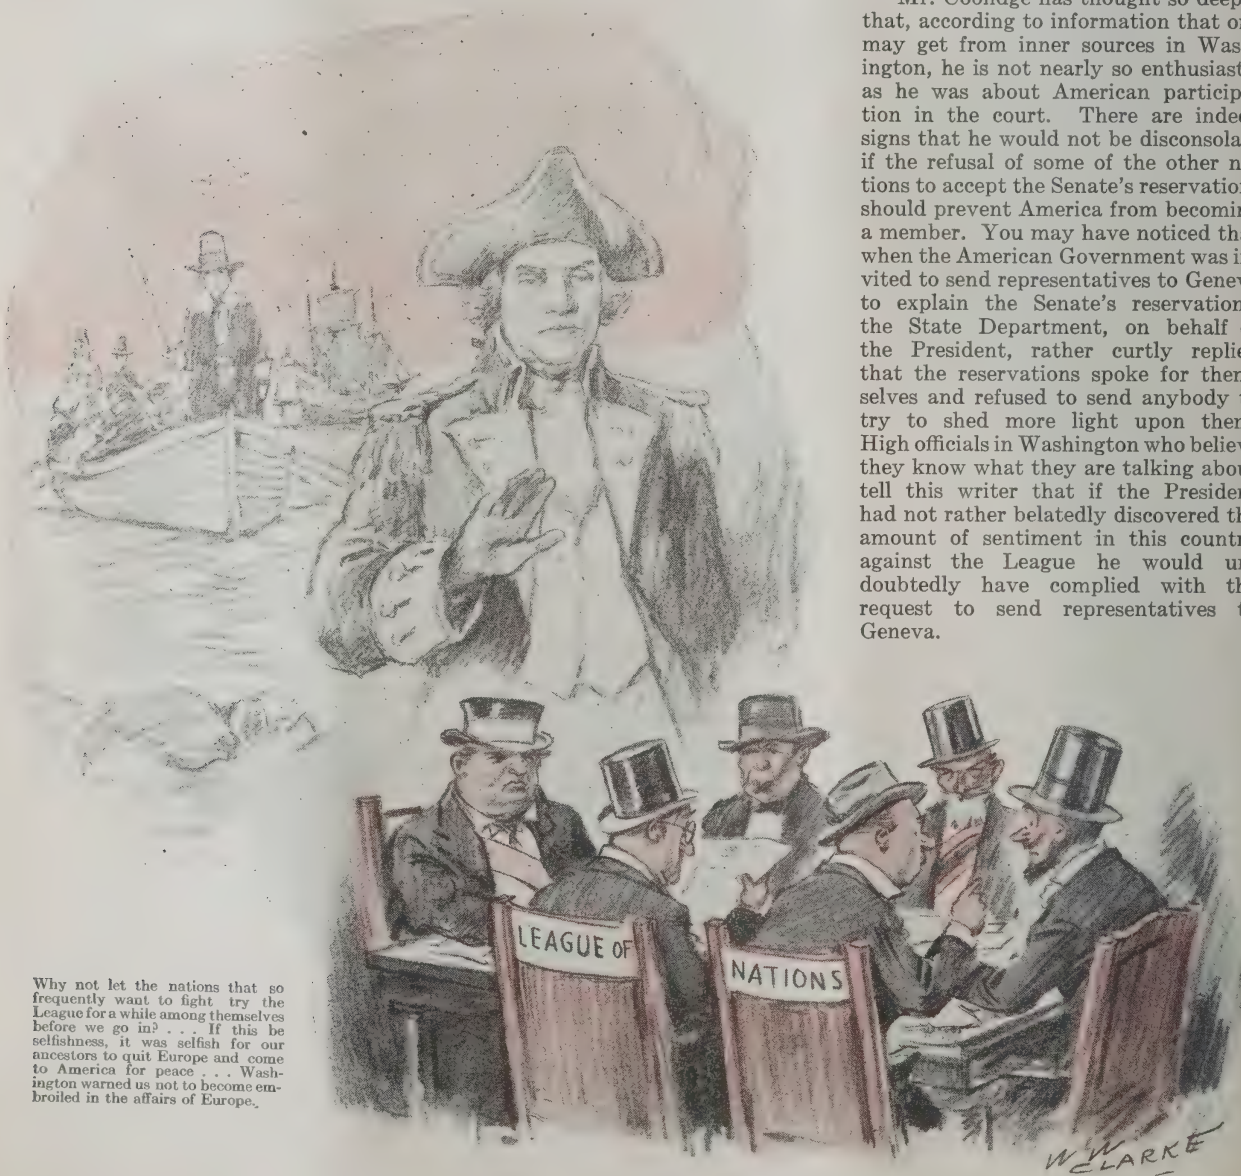
By ALLAN L. BENSON

ILLUSTRATED BY W. W. CLARKE

DO WE want larger and more destructive wars, with the United States always in them, or smaller wars with the United States out of all of those that do not vitally concern it?

Whether you know it or not, you answer this question, one way or the other, when you take a position with regard to the attitude that this country should assume toward the World Court and the League of Nations.

Whether you know it or not, you are helping to make wars larger and more destructive and to put the United States into all of them when you favor American membership in either or both of these organizations. You may favor the court because you know President Coolidge favors it and because you have confidence in his judgment.



How much had President Coolidge thought about the matter before he endorsed American participation in the court? How much did he really know about it?

Do you know that after Senator Borah's big anti-court meeting in Chicago last winter the President said he 'had no idea' there was so much sentiment in the country against the court?

Do you know that the President has been amazed at reports he has received about the receptions given by movie audiences to pictures bearing upon the subject of the court? Such is the fact. The President's picture has been flashed from coast to coast, getting hardly a hand. Borah and some of his anti-court associates have come the next moment and received much applause.

The political gentlemen who look after the President's political welfare have reported these occurrences to him and he has thought deeply about them.

Mr. Coolidge has thought so deeply that, according to information that one may get from inner sources in Washington, he is not nearly so enthusiastic as he was about American participation in the court. There are indeed signs that he would not be disconsolate if the refusal of some of the other nations to accept the Senate's reservations should prevent America from becoming a member. You may have noticed that when the American Government was invited to send representatives to Geneva to explain the Senate's reservations, the State Department, on behalf of the President, rather curtly replied that the reservations spoke for themselves and refused to send anybody to try to shed more light upon them. High officials in Washington who believe they know what they are talking about tell this writer that if the President had not rather belatedly discovered the amount of sentiment in this country against the League he would undoubtedly have complied with the request to send representatives to Geneva.

Why not let the nations that so frequently want to fight try the League for a while among themselves before we go in? . . . If this be selfishness, it was selfish for our ancestors to quit Europe and come to America for peace . . . Washington warned us not to become embroiled in the affairs of Europe.

We have made somewhat of a success of civilization in America . . . We are the last people in the world who ought to talk about going into a League. We are too individualistic—too determined to manage our own affairs.

It is doubtful, by the way, whether the other nations will accept all of the Senate's reservations. From their point of view, they will be foolish if they accept the fifth. American opponents of the court—the big ones who are making the fight in Washington—do not see how other nations can accept it. It stipulates that the court shall not without the consent of the United States pass upon any issue that concerns the United States, or any issue that the United States may 'claim' to concern it. *With that reservation, the United States could prevent the court from considering any question.* It could utterly paralyze the court by claiming that *every* world question concerns this country and refusing to give its consent that the court consider it. That would be extreme action, of course, and probably would never be taken, but the danger is nevertheless there.

Senator Borah pointed this out to a European correspondent last winter and a great howl went up among the European friends of the court at his 'audacity.' The howling has ceased. The Europeans have seen the point. The fifth reservation, if accepted, would put the fate of the court in America's hands. For that reason it is not likely to be accepted. And if it be not accepted, we shall stay out unless the President and the Senate waive the reservation. It is so strong that the chief opponents of the court never dreamed they could get past with it. They nevertheless decided to try and, to their surprise, succeeded.

If the fifth reservation should be accepted there would be no danger, of course, that the court, dominated as it is by nations that are more or less unfriendly to us, could do us any damage. We could simply tell them to keep their hands off cases that concern us.

But there is no likelihood whatever that we should paralyze the court and prevent it from functioning by claiming that everything concerned us. The business of the court would go on and we should take part in it. The judge representing America would pass upon many cases that vitally concerned other nations, and sometimes his vote might be the deciding one. His vote would be held against us by those nations that suffered from his decisions. Any good feelings that his votes might momentarily arouse in the nations that benefited from them would soon be forgotten. Among nations friendship is a fragile flower that soon withers. Only the poisonous plant of enmity is hard to kill.

And sooner or later, if we were to go into the court, every pressure, at home and abroad, would be brought to make us enter the League. We could not forever remain half in and half out of world affairs. Once we begin to meddle with things that do not concern us we shall go the limit by going into the League. Is that what we really want?

*What is it that we want?* First and foremost, *we want to keep the United States out of all wars that do not vitally concern it.* It is not our business to govern Europe or Asia. It is our business to govern the United States. The better job we make of it, the better it will be for us and the rest of the world. We can serve neither ourselves nor the world better than by keeping out of wars that do not vitally concern us. The more nations there are engaged in a war, the worse the war is for the world. If wars must continue for a while, let us do our part to make them as small as possible by keeping out of as many of them as possible.

*The whole tendency of the League of Nations is to make every war a world war.* Little nations may scrap among themselves without the big ones getting in, but when the big ones are concerned they go in and pull the little ones in after them. Even Cuba had to declare war against Germany.

It is very fine to talk about settling international disputes in court instead of upon the battlefield, and it sounds well to discuss the sanity and wisdom of gathering all the peoples of the earth within the paper confines of a League of Nations and bidding them be happy ever afterward, but *why not let the nations that so frequently want to fight try the League for awhile among themselves before we go in?*

Economic interests and racial hatreds are stronger than any words that can be written upon paper. Pledging nations to peace in a league of nations is not going to keep them at peace. The League of Nations will be a great success until the economic strains within it become strong enough to cause some of the nations to want to go to war. When that time comes a big crack will run across the face of the League. Two great groups will stand revealed. Each group will accuse the other of violating its obligations to the League. Each group will accuse the other of forsaking the ways of peace to resort to war. The people in each group will believe what their leaders tell them and the truth will not come out for years.

Europe has many problems that we do not understand and with which we have nothing to do. These problems are what make her wars. Each nation, if it should go to war, would like to have our help. We have so many men and so much money that we could be useful. But we

# New Light on the American Revolution

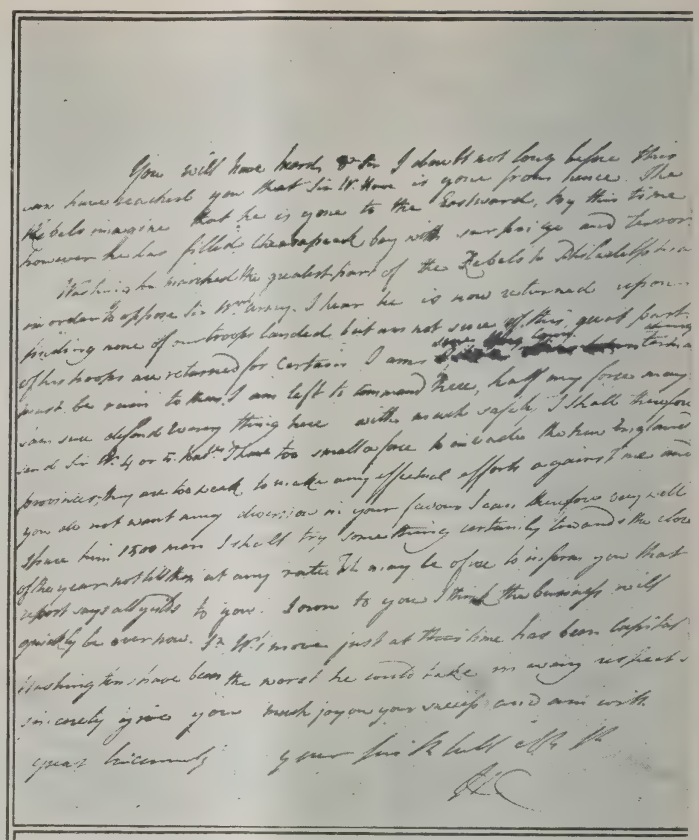
## Burgoyne's Story of the Saratoga Surrender

By RANDOLPH G. ADAMS

IN RECENT years new material concerning the American Revolution has not been great. Recently, however, the official headquarters' correspondence of Sir Henry Clinton, Commander-in-Chief of the British forces, has been brought to America, the fortunate purchase of William L. Clements, of Bay City, to be deposited in the great historical library which bears his name at Ann Arbor. In these fourteen thousand documents new light is thrown on the military history of the Revolution.

Sir Henry Clinton used these documents to write a history of the Revolution. However, so many British military reputations would have been ruined that the publication of his account wa not deemed expedient and the manuscript lies unpublished to this day.

Hundreds of new stories are coming from these papers—for Americans have not had all the sources with which to tell the whole story of the war of independence. Many students of the Revolution feel that Saratoga, not Yorktown, was the deciding American victory of the war, since that battle brought France to our side. Now for the first time we know just how it happened. From the Clinton papers emerges at last Burgoyne's own story of how and why he was defeated.



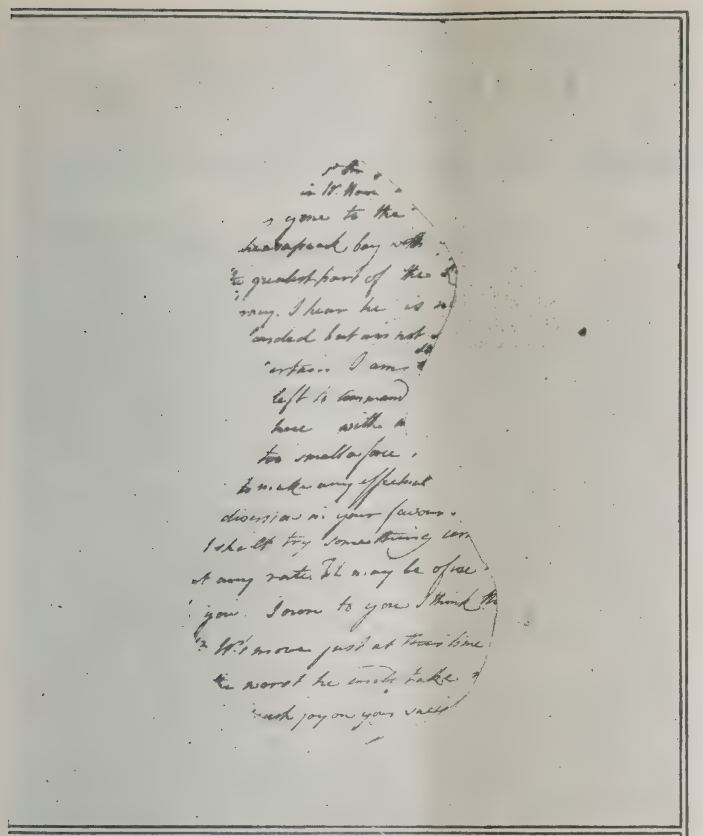
### *War Office Forgot to Tell Howe*

No one is sympathetic with a defeated general; his country does not wish his excuses and his opponents do not need them.

In 1777 General Howe was still in command of the British forces in North America and his headquarters were at New York. General Burgoyne convinced the British Secretary of War that if he were permitted to lead an army down from Canada, and if Howe were directed to march north from New York to meet him at Albany, the rebellion might be crushed and America defeated.

It was so ordered from the War Office in London. Burgoyne gathered his troops together in Canada and started south in the early summer of 1777. But for the moment the War Office forgot to notify Howe. Unfortunately for the English, about the same time that Burgoyne began his march, Howe took the bulk of the army away from New York. He left Sir Henry Clinton in command at that post with very few troops, so that when the orders came for the troops at New York to effect the junction with Burgoyne at Albany, the greater part of the British forces were down around Philadelphia fighting the battles of Brandywine at Germantown. Howe could not possibly have got away in time to rescue Burgoyne.

Consequently the task fell upon Clinton in New York to gather together such troops as he might and make a desperate effort to sail up the Hudson and meet Burgoyne. The latter commander had no idea at first that the orders had failed to reach Howe and consternation reigned in his headquarters when Clinton's curious cryptic message came through to him, which is here printed in facsimile for the first time. Clinton had to let Burgoyne know that it would be practically impossible for him, with as few troops as he had under him, to do anything—and he wanted Burgoyne to know exactly why. It could be done in a few words, but it was all-important that that message should not be understood if captured by the Americans, who held the ground between Clinton in New York and Burgoyne on Lake Champlain.



The message in Clinton's handwriting to Burgoyne, as it would appear to the casual reader: 'Sir William's move just at this time has been capital.'

It could hardly be concealed from the Americans that Howe had left New York and gone south—but it was necessary to notify Burgoyne that the troops which had been left with Clinton were utterly inadequate to effect the all-important junction at Albany. Clinton thought if he could get this message through in cipher there might yet be time for Burgoyne to save himself by retreating to Canada. He therefore wrote Burgoyne a rambling letter in which he appeared to say that Howe had gone to the south to invade Pennsylvania, and that he, Clinton, had plenty of troops in New York, twice as many as necessary to defend New York, and that he felt perhaps it was not wise at present to attack the New England states. Anyway, he said, the New England states were too weak to do anything. Moreover, wrote Clinton, surely Burgoyne had no need of any diversion and therefore he (Clinton) would send 1,500 of his surplus troops to Howe in Pennsylvania.

### *Clinton's Message in Cipher*

This fake letter is written out in Clinton's well-known hand and initialed by him. Over it, as can be seen by the accompanying pictures, Burgoyne was to lay a mask which makes the letter tell its real story. Of course both Clinton and Burgoyne had the mask, agreed upon in advance. When this mask is used the letter gives quite another mes-

The same message as it reads with the proper mask: 'Sir William's move just at this time is the worst he could take.'

sage than that given above. Instead of the words, 'Washington marched the greatest part of the Rebels to Philadelphia' the message becomes, 'Sir William Howe is gone to Chesapeake Bay with the greatest part of the army.' Instead of Clinton saying, 'I am left to command here; half my force may I am sure defend everything here with much safety; I shall therefore send Sir William 4 or 5 battalions,' which sounds very jaunty and confident, the message the English general sent appears as 'I am left here with too small a force.' Moreover instead of reading that the 'New England provinces are too weak to make any effectual efforts against me,' what Burgoyne read through the mask was 'I am left to command here with too small a force to make any effectual diversion in your favor.' Instead of reading that Clinton supposed Burgoyne needed no aid, the unfortunate British commander at Saratoga had to read that Sir Henry could not possibly come up to help him.

***Blunder Brought Disaster***

In the full letter, which anyone might read, Sir Henry Clinton writes confidently, 'I own to you I think the business will quickly be over now (i. e., that America will be defeated). Sir William's (Howe's) move just at this time has been capital—Washington's have been the worst he could take in every respect.' But when Burgoyne laid the mask over this message what he really read was 'I own to you I think Sir William's move the worst he could take.'

The rest of the story is well known. Burgoyne fought battle after battle in his efforts to reach Saratoga. Among the Clinton papers is a hurried dispatch he sent through to Clinton just after the battle at Stillwater in September. Burgoyne was fearfully perplexed. He was sure the Americans ought to have run away after the battle, but they did not run away. This letter has never been published and it is a beautiful example of Burgoyne's confusion and alarm. It is almost illegible, evidently written after a hard day's fighting.

On the heights above Saratoga Burgoyne was surrounded by the American army under Gates, and was forced to sue for a cessation of hostilities. The Clinton papers contain the minutes of the councils of war he held in reaching the determination to surrender, and also the various negotiations between him and Gates.

On October 17, 1777, Burgoyne and his troops marched out as prisoners of war and threw down their arms. On the twentieth he wrote three letters of defense. The first was to the British Secretary of War, Lord George Germain, apprising him of the disaster. That letter has long been known. It exists in the private archives of Germain's descendants in England. The letter to his superior officer, Howe, informing him of the capitulation, has also been published. Both these letters are extremely well written, temperate and dignified. He could not very well tell Howe what he thought of Germain for delaying the orders, nor could he tell Germain what he thought of Howe for not being at Albany at the appointed time

***Burgoyne Wrote Three Letters***

But on the same day Burgoyne wrote a far more important letter to his old friend, Sir Henry Clinton. To him Burgoyne could write as to an equal without any violation of military etiquette. That letter had never been seen before by historians, until it came to light in the papers now at the University of Michigan. Burgoyne told Clinton not only that his Hessians had failed to fight, but also that his British troops 'had not the complection' for further battle. He insists that Gates had nearly 17,000 men, while he (Burgoyne) was reduced to less than 4,000. As to the failure of Howe and Clinton to make the northward march, Burgoyne wrote the latter: 'Knowing your zeal and activity I am sure the fault is not yours that further and timely co-operation did not take place in my favor.' This is as close as a military man usually gets to a downright statement—but its implication is obvious. He insisted that the men higher up who planned the expedition are going to have to answer for its failure—'I take it upon myself that my orders are my justification. I was meant, as it now appears, to command a forlorn hope, and I have had the misfortune of that situation.'

Five days later Burgoyne wrote three more letters, relating in greater detail the circumstances of his surrender. Again those written to Howe and to Germain have long been public property. They were letters written in a temperate and restrained style. And again the real letter was written to Clinton, and has been buried these hundred and fifty years in the family papers of the British commander. It is worth quoting: 'I seek no pardon—I want only justification . . . Had Sir William Howe enabled you to make the same movement you lately made one month sooner, or perhaps half that time, I believe our junction would have been effected . . . The disagreeable consideration of the German troops with me has been that they are slack mettled enough to undo you, and yet not bad enough to be accused openly. They take care not to be publicly dishonored, but are of no confidence or use where activity or a steady spirit is requisite . . . Upon the whole I commit myself to your candid judgment as an officer and your pity as a friend. If I have been the sacrifice of a minister to assist great purpose, I am content in having kept back from Mr. Washington a force which might have decided the fate of the war, but if the minister lays blame upon *me* for the exertions I have used upon the principle, the spirit & the letter of his orders, I shall hold myself justified in laying those orders before the world and will stake my fame and my head upon the decision. Such ingratitude would not surprize me, I think it would not sink me.'

***Placing the Blame***

It really is in documents such as this that we find the explanation of the American victory. After all, throughout the revolution the British had more troops *(Concluded on page 28)*

# Lincoln's Gettysburg Address

## Several Different Versions Given, and Yet All May Be Correct

By WILLIAM E. BARTON

THE Gettysburg speech of Abraham Lincoln contained these words: 'The world will little note, nor long remember, what we say here, but it can never forget what they did here.' He was never more mistaken. Memorable as were the deeds which they did there, his words will long outlive the memory of their deeds. The Gettysburg Address will be printed and recited, and cast in bronze, and translated into foreign tongues for school children to learn and transmit to other children and to other schools, centuries after it will have become necessary to append footnotes to explain whether the Battle of Gettysburg was fought in the American Revolution, or was one of the bloody engagements of the World War. Yet the world came so near to fulfilling the prediction of Abraham Lincoln, it took so little note, and made so small an effort to remember what he said, and it had for nearly two more years so much reason to think of what the soldiers did, it would almost seem that Lincoln came near to being right about it. Even yet there are a number of disputed and unsettled questions about the matter, quite enough to justify our reminding ourselves what he said and how he came to say it, and with what degree of interest and prospect of remembering the world took note of it.

The Gettysburg Address was one of the most conspicuous of the events of Lincoln's Presidency. It was reported at the time in all the prominent newspapers. It was heard by an audience of many thousands, of whom a number are still living. It ought to be very easy to tell the story of the Gettysburg Address, and it is well worth telling. Let us go to contemporary documents, to accounts in newspapers as they appeared at the time, and to the men still living who heard him, and learn what Abraham Lincoln said there, and what note the world then and later made of his memorable utterance.

I suppose there is no one now living who has conversed or corresponded with more persons who heard the address than I, and I have read somewhat diligently the literature of the time regarding it.

As to Lincoln's preparation, I am prepared to prove that he did not make any, but trusted wholly to the inspiration of the moment; that he made hasty preparation on the morning of the delivery of the address; that he wrote it the night before its delivery; that he wrote it on the train be- (Continued on page 29)

Address delivered at the dedication of the Cemetery at Gettysburg.

Four score and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We have come to dedicate a portion of that field, as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

But, in a larger sense, we can not dedicate — we can not consecrate — we can not hallow — this ground. The brave men, living and dead, who struggled here have consecrated it, far above our poor power to add or detract. The world will little note, nor long remember what we say here, but it can never forget what they did here. It is for us the living, rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us — that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion — that we here highly resolve that these dead shall not have died in vain — that this nation, under God, shall have a new birth of freedom — and that government of the people, by the people, for the people, shall not perish from the earth.

Abraham Lincoln.

November 19, 1863.

Facsimile of Mr. Lincoln's autographic copy of the Gettysburg Address, made by him for the Soldiers' and Sailors' Fair at Baltimore, in 1864.

# MR. FORD'S PAGE

AT A recent College Commencement an observer from abroad commented on the large number of men who received degrees in the various branches of engineering. He said it was the first time in his experience that he had seen letters, philosophy and science outpulled in their attractive power upon the younger generation by what he termed mechanics.

But what he conceived to be a new and stronger lure to mechanics was only in appearance, for there have always been more men engaged in the mechanical work of the world than in letters, the arts or pure science. The difference is here: whereas men who formerly devoted themselves to engineering and mechanics went directly to work; nowadays many of them go to school, and the number is so great that it seems to be threatening to swamp the others. But the number of those who devoted themselves to the science and art of mechanics was always greater than the others. Had it not been thus, freedom to follow letters and philosophy would not have been possible to so many.

For a long time it was felt that one who went in for books was entering the 'learned' world, while one who went in for machinery was entering a rather lower plane of intelligence and living. The height of respectability was the white collar and the white hand, and these, incidentally, at the expense of collarless men with calloused hands. It is a position hard to understand until you know that people who held it were ignorant of the vast amount of learning which underlies mechanics, of the incessant research and experiment its development demands, of the precise knowledge of natural law involved in all its processes, and the endless exploration by scientific outposts which every new step entails.

The men who went in for engineering have touched the arts and sciences at every point: they made the printing press and built cathedrals, they burst the bounds of artificial economics and broadened politics, they have made more history than the warriors and greater conquests than the kings. In tardy recognition of their essential place in life, the universities began to *teach what engineers had learned.* The universities do not teach engineers; they relay what engineers have taught the universities. The science is first, the teaching of it second.

It is not by accident, perhaps, that, as our observer from abroad remarked, the candidates for the degrees in engineering seemed to represent a distinct type of character.

The profession attracts a certain type and afterward offers that type, developed and strengthened, as a potent force in world affairs. The engineer type of mind may yet be the remedy for the aberrations of the political and financial types of mind in public affairs. An engineer knows without thinking about it, without any conscious moralism, that nothing which is wrong can ever be right. You cannot violate law and have your machinery work, whether it be made of metal or money or men. The engineer is committed to the creed of Use; everything must be used, everything must have a use; in Use is Life.

> *THE solid, serious, serviceable work of the engineering and the mechanical world has always attracted the greater number of men set upon careers, but that fact has only recently been recognized, and then only through the increase in college courses in these fields. Whence arises the mistaken notion that this majority choice of engineering is a new phenomenon? It is not. All that is new is that colleges are now teaching what engineers have discovered. This should be said for the comfort of frightened souls who see in the new college trend a new and destructive onslaught of 'Materialism.'*

The prejudice against engineers as being those who would 'standardize the world' is as ill-conceived as would be a similar prejudice against biologists. Both study to know what life does, how life works, which way life is going, that men may keep step with the mind of the universe. No one who knows anything about life ever thinks of 'standardizing' it in the false sense implied, any more than one thinks of twining the first branches all into one pattern. Our greatest engineer will be like our greatest American philosopher—a pragmatist. The best machine is an affair of easements and allowances bound up in a body of definite purpose and precise relationships, and were human society more like that, freedom would be increased in the world and distress greatly lessened. People who cry out against a 'standardization' simply fail to see that *this* and *now* is the standardized thing, this wobbly system of ours, these inequalities, injustices, unnatural pressures, fatal limitations—these are the 'standardized' things, and the sooner we are rid of them the better.

Engineering means freedom. Men were held to a single spot before the engineer came. By steam and motor car and airplane he has liberated man spatially. He has lengthened man's day with light, increased the limits of man's life through food and sanitation, emancipated man's mind and given him a sense of possible mastery over elements and environment—in short, the engineer found society static and made it fluid. Yet he is now charged by bookish people with being desirous of turning the world into immobile cast iron again!

When engineers begin to bring engineering ethics into banking, into Congress, into municipal government, into social supply, we may expect more liberation in the world.

## The Brookhart Bogie

NO ONE would take the responsibility of declaring Smith W. Brookhart to be either a great economist or a great prophet. So that the attempt to scare industrial America with the rehearsal of his ideas is rather amusing. Certain politicians want to paint Brookhart's portrait in the attitude of Samson pulling down the pillars of the sacred edifice of our economic system. And certain political-business men start out to ring the tocsin of alarm, to summon an imperiled nation to rescue itself from the peril of Brookhartism. Mr. Brookhart happens at the moment to be a vehicle by which the people of his state can express their opinion of regular party politics. It does not necessarily mean that the people of his state regard him as a great statesman. We do not necessarily have a high regard for the stone which we throw at the object of our dislike, and Brookhart is a stone thrown in derision and disgust. Because Iowa finds so little in common with the present coterie government it seeks to emphasize its attitude by showing how small the common ground is. The Administration cast Brookhart out (it caused no great flurry, either), but because the Administration does not want Brookhart, Iowa decrees that Brookhart is just what the Administration is going to get. He is a handy missile, and apparently he does not suffer much breakage in the heaving back and forth.

As to Mr. Brookhart's statement that capital should not hire labor, but labor should hire capital, the form may be somewhat crude, but the essence is in agreement with what modern industry has been saying for some time. Mr. Brookhart is doubtless hazy on what he means by capital and labor. Classification is not so easy as that. There is something that enters between what he would call capital and labor—it is industrial leadership. This has felt the injustice of capital quite as much as has labor. And industrial leadership has developed a very clear conception of the functions of capital as the handmaiden of industry and not its mistress, the servant of industry and not its master. Put into such terms, Mr. Brookhart's thought is not revolutionary at all, nor even socialistic. Industry should use finance for its productive ends, and finance should not use industry for its speculative ends —that is the thought. Mr. Brookhart should clarify his expressions. He should not give reactionary old gentlemen and superficial politicians such sudden frights. That is, he should himself be very much on guard against envisaging himself as an economist or a prophet.

## The Root of Evil

WITH no intent to minimize the wrong that may have been done in the Pennsylvania senatorial primaries, it is nevertheless pertinent to indicate wherein the taint of evil attaches to election funds. Is it to the funds themselves, or the uses to which they are sometimes put? It would seem that money spent to educate the electorate in all the phases of a debatable political problem should be money well spent. Parties and candidates could do much worse than pool their funds, if necessary, in order that this kind of education might be carried on a great scale. It would be to the great benefit of politics generally. But funds spent to debauch the electorate, to 'buy' anything, in the sense of getting for money that which it is immoral to give for money—such funds are a menace to the land. It appears that sometimes the expenditures in behalf of a decent candidate may exceed in amount those in behalf of a less desirable candidate, in which case were it the fund itself that was condemnable the better man would be counted the worse, and the worse the better. Clearly even the right use of excessive funds presents a problem of serious character. Money has such terrible capacity to beget evil! If the money *spent* were money *given*, or its equivalent in service, by an awakened electorate, the outlook would be different. But even decent money becomes indecent when employed in excessive amounts in political campaigns.

## Truth at Last

> 'National Fertilizer Association opposes production of fertilizer at Muscle Shoals at prices lower than those of private enterprises.'
>
> —*Wall Street Journal*, June 9.

HERE it is at last. Muscle Shoals *can manufacture* fertilizer at lower cost than the fertilizer trust *will* manufacture it. Therefore, both the trusts and the Government have cast their votes against the farmer and in favor of extortion. In the above dispatch is the core of the Muscle Shoals problem. The mystery is that it should break into print

## *One More Quarrel Missed*

EVENTS continue to justify the instinctive wisdom of the American people in refraining from entanglement with the present League of Nations. That body is now involved in a quarrel with an American nation—Brazil—which has resulted in the latter giving notice of withdrawal. The difference of opinion leading to so solemn an act is of such nature as to have led inevitably to an appeal to the United States for influence, pressure or judgment, had the United States been in the League. And this appeal would have led to a division between two American nations, or, if not that, to a division between America and the League, contingencies which cannot be contemplated without a sense of their possible serious consequences.

As rupture follows rupture, and misunderstanding ripens into hostile parties in the League, the American who wishes well to his country and the world finds in each event a new occasion for thankfulness that his country is out of it. And this does not mean, as all the propagandists insist, that America is selfishly avoiding her international responsibilities; it means only that America is thankful that whatever power or influence she has is not being frittered away in these internal quarrels of the League which are always big with possible external consequences.

What lies behind Brazil's act is partly known; whether it is a part of a program which will be developed along broader lines by the group of Latin nations can only be surmised. How the League will react to this first defection is yet to be seen. But there can be no doubt that the United States is fortunate in not having had to take a stand with regard to these quarrelsome matters, and that she can reserve her moral force for use in the larger issues when they may arise.

## *Florida Dons Overalls*

HEARTENING news comes from Florida. The people are turning from real estate to land. The plow is replacing the subdivision stake. True prosperity depends not upon inflation of land values, *but upon production.* The state is getting back into production. Florida took a gallant step when she banished the 'binder boys' and other real estate sharpers from her borders. It stopped soaring prices, but it restored the confidence of the nation in Florida's good faith. And now the state goes back to fundamentals. Instead of placing exorbitant values on idle land, the people are extracting real values from active land. The state has unique advantages, not only as a resort place but as a producer of essentials. Florida—in overalls—has a great future

## *United States of the World*

WHAT man has failed to do by ethics, by sermon and by written word the progress of machinery is accomplishing.

Treaties for international amity have proved but scraps of paper; sermons setting forth the right ways for man have brought results far short of the basic ideals; intentions of nation and individual have ended in disappointment and broken visions.

Europe has been a mess of politics between countries divided and subdivided by mountain, river and desert into a multiplicity of peoples and tongues, a tangle of chaotic ways of thinking and acting.

No legal or political conclave has sat with success to bring out order and brotherhood, and no desire on the part of individual nations has resulted in entity. Yet the solution is at hand.

Today the airplane levels mountains and rivers and deserts and man moves on an ocean that comes to every neighbor's back door. Every farmer's field is become a port of entry, and planes cross boundaries and scan adjacent nations at will.

Radio, as well, knows no international boundary, and carries the soon necessity of an international language, and thus international thinking.

The man who shortens the distance between two nations increases their understanding in like proportion, and decreases their likelihood for misunderstanding.

He who can make common a travel between New York and London which will accomplish the distance regularly in a day's space will do more for humanity and the brotherhood of man than all the treaties and all the sermons that have ever been or will be written.

He who can arrange international broadcasting of international programs will bring the world to a complete understanding.

And eventually there will be a United States of the World.

---

## *We Sign Anything*

READ before you sign. A western professor passed an interesting looking paper about among his students, ostensibly asking for a holiday on a prominent American's birthday. Forty-five students readily signed the paper without giving it more than a passing glance. When the professor read the document to them they discovered that they had also signed a petition to have their right arms cut off at the elbows. It was a good test and one that the students will long remember. Too many sign on the dotted line without reading the text above carefully. Promissory notes and other catches may be hidden in the text of a document. Read before you sign.

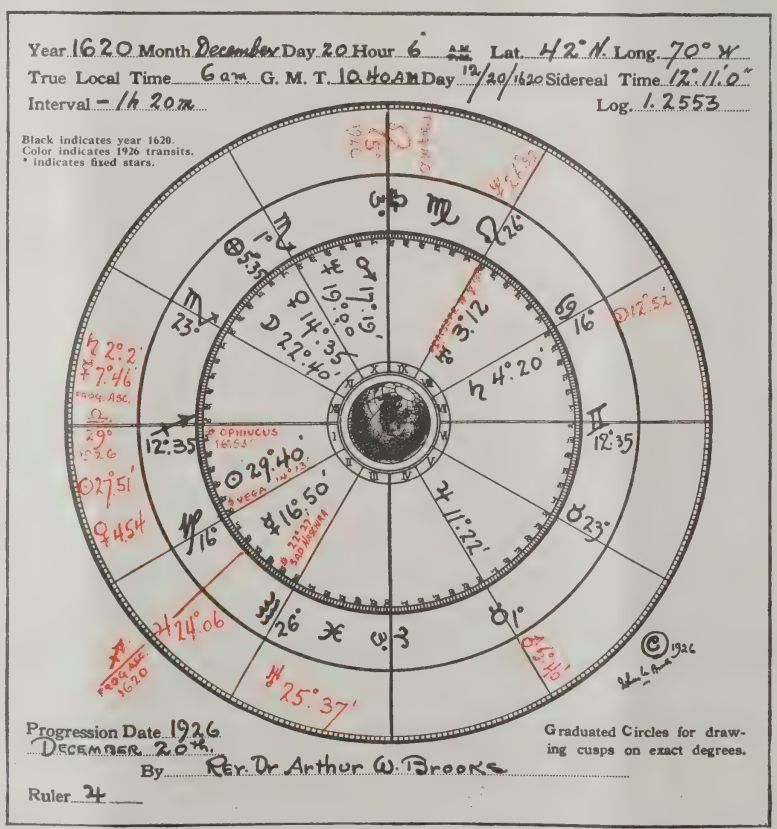
# Casting the Horoscope of the U. S.

## Reading the Stars for the Declaration of Independence; What the Portents Are for the Next Ten Years

By ARTHUR W. BROOKS

MR. BROOKS is a clergyman of the Episcopal Church and Vicar of the Epiphany Guild of America, an organization which seeks to promote culture, character and efficiency through a study of all known forces which may have a bearing on temperament and destiny. Mr. Brooks is the author of numerous articles on the astrological aspect of life and is credited with having made important forecasts, based upon his reading of the stars. This article is offered as an illustration of the astrological forecast of the next ten years of United States national history.

TEN years in the future! The very thought of having some reasonable and reliable scientific basis for determining the probable trend of the affairs of the world is thrilling. It is not possible to enter into any lengthy argument concerning the merits of astrology, for the allowed space forbids.



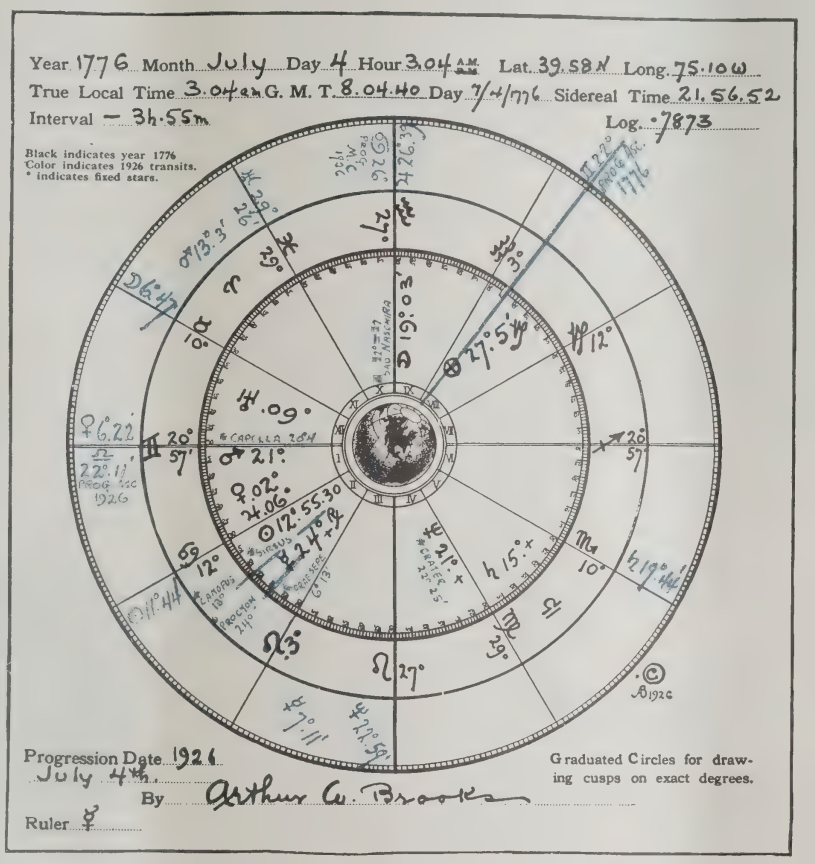
The method of forecasting by this age-old science has been a matter of public information for many centuries. As a clergyman I need not apologize for accepting the values of the science, for many notable 'men of the cloth' have been numbered with the outstanding authorities of the past. Astrology is a study of the planets in their relation to the zodiac and the aspects they form to the sun and moon, as considered by degrees and angles from the earth, with definite laws of interpretation. It has been found by precise investigation that the course of human history corresponds in a most remarkable manner with what is indicated by the movement of the planets, according to these laws. One may naturally conclude that there is some definite interdependent scheme of action at work in the universe, and as the celestial bodies are a part of the whole it is natural to conclude as a working hypothesis that there is some action and reaction between them and the rest of manifested nature. In fact the fundamental basis of astrology is that there is some magnetic interrelation, a sort of radio activity, which is constantly producing changes. Mathematics form the basis of astrological calculations, together with a working knowledge of astronomy and the fixed rules of astrology. Added to this there is the human equation—the ability accurately to judge values and to express these terms in the language of the people. It is simple—if you know how.

Because I have tested this science over a period of years I am willing to let it be known that I believe there is a far greater field for astrology than we usually think, and that it can serve humanity in a peculiar and most appropriate manner. In fact, I am convinced that many costly mistakes both as to national policy and personal matters can be avoided by a knowledge of the future trend which astrology affords, and I anticipate the time when there will be established and endowed an adequate research foundation purely for the study of astrology along the most modern lines of science, and thus provide a channel for guidance. But what of the future?

July the Fourth of the year 1926 marks the 150th year of the signing of the Declaration of Independence, the anniversary of the birth of the United States of America as a free and independent nation. We shall therefore consider the horoscope for the Signing of the Declaration of Independence, jointly with the horoscope for the Landing of the Pilgrims and in a general way the Kabbalistic World horoscope, with calculations based upon the future movement of the planets in the zodiac and the principal configurations. To give credence to what will follow in the way of predictions, let us turn over a few pages of history and note the outstanding decisive moments or mileposts in the life of this nation. To do this we must of necessity go back to the Landing of the Pilgrims at Plymouth Rock, December 20, 1620, at six in the morning.

In preparation for this article I have gone over some old astrological manuscripts in which a noted English astrologer, Sir William Lilly, calculated and published the horoscope for this momentous event. It appeared in an old English Almanac of 1649. A brief historical note relates as a fact the displeasure of some of the British nobility, for the astrologer predicted for the new infant America an ultimate severence from English control and their loss of a colony rich in natural resources yet undiscovered.

The years from 1620 to 1776 were years of hardship and struggle. Only fortitude, heroic effort and stability, such as our Pilgrim Fathers had, could have laid the solid foundation of a na-



Dr. Brooks' horoscope of the Landing of the Pilgrims, Plymouth Rock, December 20, 1620, six a. m., treated in this article.

tion now powerful and prosperous. The horoscope for the Landing of the Pilgrims shows just these sterling characteristics and the signature of the stars truly reveal a great destiny. Jupiter, the planet of expansion, is the ruler of that horoscope and the Sun was in Sagittarius and in the ascendant. Mercury was also rising and Venus was in the oriental semidiurnal arc of the chart in Scorpio and in the orb of a conjunction with the moon. The sun and the moon were in benefic aspect. This chart is testimony to any competent astrologer of a great destiny, and what is more, our history coincides with what might have been expected and predicted of this nation.

Jupiter has singularly ruled over the destiny of this people. Peace, prosperity and a new conception of liberty have been our lot. Freedom of expression and the idea of democracy have taken hold upon us and this has swayed every department of national activity. The embryonic nation was created in a religious environment, and notwithstanding the woeful urgings of a few pessimistic prophets of our time, we are yet a religious people with higher ideals and a more practical religious expression in human terms than the majority of foreign nations.

Every important epoch of our history seems to have been under Jupiterian influence. The fact that the three most important events in our early history took place under Jupiter's influence cannot be passed by as mere coincidence. The Landing of the Pilgrims, the Declaration of Independence and the Adoption of the Constitution of the United States took place under strong Jupiterian influence. And it may not be out of place to recall the fact that the Presidents under whom this nation has been most prosperous at home and successful abroad during their respective terms of office were nominated, elected or inaugurated, as far as I have been able to calculate from the data at hand, under strong Jupiter influence. President Coolidge was nominated under the benefic influence of a Jupiter day and at a Jupiter hour.

Sibley, the noted English astrologer, published in London, in 1784, the horoscope for the Signing of the Declaration of Independence. The previous Solar Ingress, June 20, 1776, indicated for Great Britain a pending serious conflict between the mother nation and a colony and the loss of that colony by defeat in a revolution.

Horoscope of the Signing of the Declaration of Independence, Philadelphia, 3:04 a.m., July 4, 1776. 'Congress sat all night debating.'

That horoscope for the Declaration of Independence predicted a great destiny which included victory in wars and expansion by leaps and bounds; an extensive international influence, commercial and industrial expansion and a heritage which would make her a great power among the nations of the world, and an ultimate destiny to leadership in world peace and disarmament by an original and unique method. This latter is yet to be fulfilled. It is, however, written in our destiny.

Besides these things, the horoscope shows enormous and increasing controlled resources, with fecundity and prosperity abounding among a carefree, happy and contented people.

There is one outstanding feature about the astrological chart for the Declaration of Independence. The moon is in the ninth section near the mid-heavens and in the Sign of Aquarius. Saturn is in the fifth section and exalted in Libra which indicates very strong humanitarian and benevolent qualities both to give out and to attract others to our shores, accounting for our marked generosity in helping disabled and crippled nations with our resources and the magnetic attraction of the nation to multitudes who have come to our shores and who yet clamor to come. But more than this, our contribution to disarmament and universal peace will bring these hopes to actual fruition in due time.

We shall give a few other instances in support of the influence of Jupiter and then pass to the future forecast.

March 5, 1770—British soldiers opened fire on a crowd in Boston, called in history the 'Boston Massacre.' Jupiter transit in Sagittarius 22 degrees forming a conjunction with sun and approaching an opposition to Saturn in the Pilgrim chart. This act was the beginning of what later culminated in the Revolutionary War.

Oct. 19, 1781—General George Washington received the surrendered sword of General Cornwallis. Jupiter transit Sagittarius 16 degrees having left a conjunction with the sun and ascendant in the Pilgrim chart and in sextile aspect to Mars and Neptune. The war ended, with victory for the American republic.

Sept. 3, 1783. Peace Treaty was signed with Great Britain. Jupiter transit in benefic aspect to the ascendant in Pilgrim chart and trine to Jupiter place in the Independence chart.

The War of 1812 was apparently under Jupiter influence. Vital statistics lacking, this cannot be verified and checked up astrologically.

April 25, 1846, President Polk in a message to Congress declared 'War was begun by the act of Mexico.' Jupiter transit leaving conjunction Jupiter in Pilgrim chart and forming a benefic trine to Mercury, showing speedy victory. This war ended when General Scott with only 6,000 men entered Mexico City September 8, 1847. Jupiter in Cancer in benefic aspect to Jupiter and Venus in the Pilgrim chart.

December 20, 1860, the Civil War began with the Secession of South Carolina. Jupiter transit in Leo 26 degrees square to the place of Jupiter in the Pilgrim

chart in opposition to the moon in mid-heavens of the Independence chart. Proclamation of Emancipation by President Lincoln issued under Jupiter transit in conjunction mid-heavens in benefic aspect to the sun in Pilgrim chart. The Civil War ended April 9, 1865, under influence Jupiter transit in conjunction sun in the Pilgrim chart and in conjunction with the part of Fortune in the Independence chart.

February 15, 1898, the Battleship *Maine* was sunk in Havana Harbor.

*Leo and the World War*

Jupiter transit in benefic aspect to the ascendant in the Pilgrim chart but in near conjunction with Saturn in the Independence chart accompanied by several malefic aspects. An ultimatum was signed 11:10 a. m. April 20, 1898, fixing the blame on Spain. War was declared the following day under influence Jupiter retrograde forming conjunction with the mid-heavens of the Pilgrim chart and several slightly adverse aspects as considered from the Independence chart. This war ended August 12, 1898, under the influence of Jupiter going direct transit the mid-heavens in the Pilgrim chart forming several good aspects.

April 6, 1917, our part in the Great World War was cast by a declaration of war on Germany because of overt acts. Leo was in the ascendant at Washington at 1:18 p. m. on that day when this act was signed, with the Sun in Aries and Mars strong and there being several adverse aspects, but Jupiter, our planet of destiny, showed benefic outcome and victory.

The war ended November 11, 1918, under strong influence of Jupiter in benefic aspect to its own place in the Pilgrim chart and with Jupiter in strong aspect with Venus, indicating peace.

I have not given an account of the small fracas with Tripoli in 1801 and with Algiers in 1815, but these, like all other wars, were caused by the overt acts of the nations opposing us, and this may be accounted for astrologically by Mars and Neptune in the mid-heavens of our Pilgrim chart—a nation warred against, but never on a war of conquest.

According to the Kabbalistic cycle method of computation, the earth is under the influence of the Mars planetary cycle, which began March 21, 1909, at 6:13 a. m. and will end in 1944 at the Vernal Equinox. I have computed this cycle with the dependent sub-planetary cycles interlaced and events of history since 1909 coincide in a most remarkable manner with what might be expected. It is therefore reasonable to assume that history will repeat itself while under this cycle.

Let us begin with this current year. Keep in mind that the Mars cycle is prevailing, and that a sub-cycle is considered as a focal influence. This year, 1933, and 1940, Mercury prevails, indicating vast commercial mergers, commercial developments and expansion, progress in science, literature and means of transit, communication and travel, inventions and education. Mercury indicates rapid changes and sometimes reversal of former policy. Several adverse configurations this year indicate a danger of political blunders and misunderstandings, and also changes in ideas and methods of reforms.

Uranus is nearing the end of Pisces. July fifth this planet is 29 degrees and 26 minutes in Pisces and will be retrograde until the end of the year, entering Aries April 1, 1927. In the Pilgrim chart this will form an opposition to the mid-heavens. In the Independence chart it will be forming an opposition to Neptune.

And this portends danger of some serious international misunderstanding which may lead to war, also, some perplexing problems for the President and the Government, and perhaps some personal danger to the Chief Executive.

Neptune is the sub-cycle ruler in 1927, 1934 and 1941, indicating years of crises for the nations, socialistic tendencies and revolts, accompanied by labor and capital disputes and serious costly strikes. Saturn will be in Sagittarius and approaching the ascendant in the Pilgrim chart and approaching an opposition to Mars in the Independence chart. These will be years of crises for our republic. Very little progress will be made by the nations of the earth, and doubtful foreign loans will cause this country grievous

*There Will Be Years of Strife*

trouble and anxiety and probably serious losses. There will be a chaotic situation to deal with. Also, the position of Uranus at this time and the result of its proximity point in each mundane horoscope for the spring, summer, autumn and winter quarters for the next two or three years places the planet either in conjunction, square or opposition to the sun, so that the period from the autumn of 1926 to 1929 in particular will be marked by many changes in the governments of the earth and in political circles of republics, attended by sudden and unexpected complications and many uncertainties in the affairs of statesmen, monarchs, presidents and rulers and even a complete reversal of public policy, political downfall or reversal in the exercise of power. This period will witness the most sweeping changes since the 1914-1918 period of war. The United States will not be exempt, and while we have a unique government with opportunity given the people to change from one election to another, yet this influence will make itself felt in opposing political parties and great confusion will ensue over racial and religious questions.

Saturn is the sub-cycle ruler for 1928, 1935 and 1942. With Mars as the principal planetary ruler and Saturn the sub-ruler in 1914 and again in 1928, it portends a repetition of this dark period in 1935 and 1942.

These years are foreshadowed as years of strife, depression, general misery and want among the people and grave danger of strife and war between nations, and serious industrial depressions at home.

In fact, between 1927-1934 I expect to see several new and unheard-of leaders rising to take their places as dominant factors in the destiny of the governments of the earth. They will be dictators and rule with an iron rod, and being militaristic in nature they will endanger the peace of the world

*A Period of Reconstruction*

and shatter the hopes and dreams of those who are working for disarmament and universal peace. This will be the influence of Uranus in Aries, and this planet remains in a sign for about seven years.

As for the United States of America, Saturn in Scorpio square Neptune from Leo indicates complications for the present administration; danger of serious mistakes in policy; loss of public confidence, attended by criticisms of the President and other Cabinet members and a grave disappointment in some governmental project. This will give cause for attacks by which the opposing party will gain a considerable political advantage. During 1927 and 1928, financial slumps will occur and unemployment will become a serious problem.

The next sub-cycle is that of Jupiter. This will occur in the years of 1929, 1936 and 1942. These will be benefic years, particularly to the United States. As Jupiter is favorable to this nation, I expect these years to bring expansion, reconstruction and good fortune with our share of prosperity. These years will be marked by social, religious and economic reforms of a far-reaching character, accompanied by financial increase and very little unemployment.

As for the nations abroad, it will be a period of reconstruction after previous political and international troubles, with the year 1930 marked by steady progress, changes in mental thought and activity in all departments of life and expansion in industry,

*Revolutions Will Grip Europe*

widespread construction and laying plans for the future.

In the period between 1926 and 1943, another war or series of revolutions of a sweeping character will grip Europe, the outcome of which will smash the present European system and greatly change the map. After this period there will be begun the organization of a United States of Europe, reëstablishing boundaries similar to those involving the area once known as the Empire of Imperial Rome. England will (Concluded on page 28)

# Originality Is the Aim Of the Modern Artist

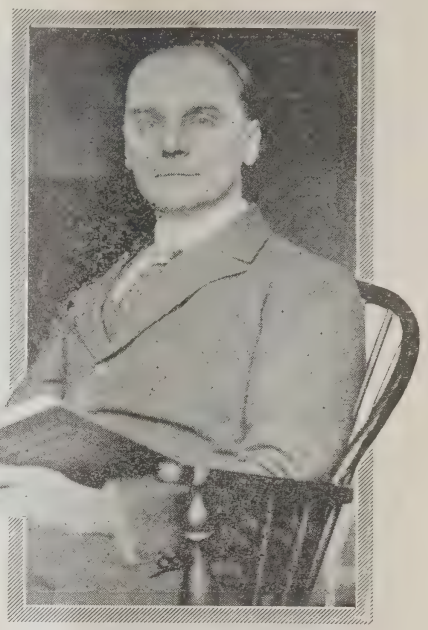
## A Painting, He Says, Should Be an Invention, So He Discards Age-Old Modes and Manners

By EUGENE LEUCHTMANN

PRACTICALLY every decade brings forth its own artistic sect. In every generation the artist is a mystery, and in none more than in this. I have undertaken to tell what modern artists are about, as they have told it to me.

With the development of the camera as an almost perfect agency for visual reproduction and representation, need for the story-telling picture and the historical painting has been reduced. The frescoes and mosaics of the ancients depict, with truth and fidelity, the customs and manners of their times. The artist of this modern age, however, knowing that he cannot compete with the camera in faithfulness to nature or in the representation of events, modes, and manners, has revolted against what he terms the craftsmanship of the painter.

He no longer seeks to *imitate* on canvas the subject he would paint. He has no desire to duplicate the work of the photographer. His mission, he says, is to produce an original design which has value as an esthetically significant form—something which has given him a moment of esthetic ecstasy to produce, and something which in turn will produce in others a like ecstasy because of its formal purity.



Art, says our modern artist, has nothing to do with life except in its effect on life. Paintings should be inventions. The picture of a chair, though most exquisitely painted, is an imitation of the chair and not a work of art.

In the painting by Mattisse, shown with this article, the chair is seen to be painted with but two legs. The other legs have been sacrificed to form. To have added them would have broken up the sweep of the forms.

The Mattisse was bought at considerable expense by a leading Middle Western museum. At the time of its purchase it aroused much comment, and the debate which marked its acceptance by the board of the museum almost threatened to disrupt that body. It has since been the butt of the humorous element in the art life of that city, but it is hanging on the walls of the gallery and occupies among the moderns a conspicuous place.

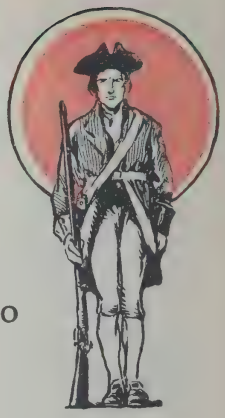
The canvas has been called, by the men who favored its purchase, a study in forms They pointed out that the radiator under the window is not used as a radiator in the study but as pure form, and that the entire canvas is a design in which it has its particular place. Through the window the sun streams in, but in revolt against the Impressionists, Mattisse has made his dividing line between sunlight and shade a sharp one, cutting his composition in two, and his forms a solid color, unrelieved by a secondary shade.

As opposed to pure form, which the Cubists have adopted as their main tenet, there are others who express form and rhythm in a composition in which the main elements are things of life, even things of our everyday life. The arrangement of figures in a composition, the subjection of the component forms to the main form of the picture, is the aim of these artists.

Dr. W. R. Valentiner, of the Detroit Institute of Arts, who is interviewed in this article on the modernist tendencies of art.

Dr. W. R. Valentiner, now art director of the Detroit Institute of Arts, traces the modernist tendencies not so much to the revolt against imitation and photography, as to a natural tendency on the part of the artist, as the representative of his people, to follow the trend of the world affairs and world history.

'One does not expect that an art born out of the soul of the people, and expressing its deepest suffering, shall ingratiate itself through charm and surface agreeability,' he says of the tendency toward the stark and the unsugary in paintings. 'Such an art is in direct contrast with a superficial ideal of taste. That which is born out of revolutions cannot be measured by the petty standards of an art based on luxury. Since the 18th Century there has existed a "society" art that even today dominates wide circles. This conception of art has poisoned the taste of the public and has only an appearance of life. But there is also an art that is life itself—that rises out of the depths like a cry, and in this cry carries the deepest expression of true humanity. So it has been always with the great art of the past, and so it will be again with modern art.



'Let us not be misled if our first impression upon seeing the canvas of a modern is unexpected and not always pleasing. Is not actual experience—and what else is art?—always unexpected and startling? Let us but recall the first appearance of the great artists of the past *(Concluded on page 18)*

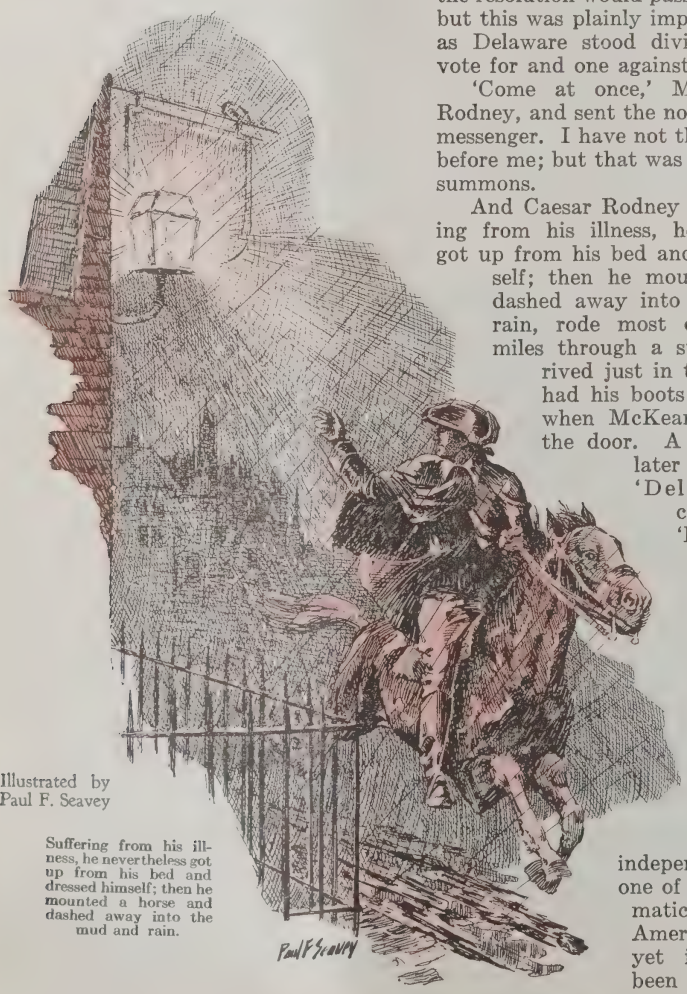
Painting by Henri Mattisse, with its two-legged chair, purchased at considerable expense by a Middle Western museum.

# Rodney's Ride for Liberty

## Here Is Told the Story of the Delaware Patriot Who Rose From a Sickbed to Vote for Independence

By CARL SCHURZ LOWDEN

Copyright, 1926, by Carl Schurz Lowden.



WE HAVE 'Paul Revere's Ride,' by Longfellow, and 'Sheridan's Ride,' by Thomas Buchanan Read; but 'Ceasar Rodney's Ride' remains an unsung epic, unsung because it has never been written.

Caesar Rodney, a delegate from Delaware to the historic Congress which met in Philadelphia, was not present during the long discussions on independence that preceded the formal resolution of July 4, 1776. He was sick with a cancerous affection which deformed one side of his face. His physicians believed him to be on his deathbed; they had prescribed relaxation and rest. The other two delegates, Thomas McKean and George Read, were divided on the question. McKean stood strong for independence; Read, none the less patriotic, opposed it because he did not consider the psychological moment for such momentous action had come. 'Stop talking and act' was McKean's policy; Read preferred a policy of watchful waiting. McKean observed that all of the other colonies would cast a 'Yes' vote. He wanted Delaware to fall into line so the resolution would pass unanimously; but this was plainly impossible as long as Delaware stood divided with one vote for and one against.

'Come at once,' McKean wrote Rodney, and sent the note by a special messenger. I have not the exact words before me; but that was the gist of the summons.

And Caesar Rodney came. Suffering from his illness, he nevertheless got up from his bed and dressed himself; then he mounted a horse, dashed away into the mud and rain, rode most of the eighty miles through a storm, and arrived just in time. He still had his boots and spurs on when McKean met him at the door. A few moments later the name of 'Delaware' was called.

'I vote "Yes,"' the ailing man shouted as, exhausted from his long ride, he sank into his seat. Delaware had been saved. The colonies had unanimously declared for independence. It was one of the most dramatic incidents in American history; yet it has never been dramatized.

Illustrated by Paul F. Seavey

Suffering from his illness, he nevertheless got up from his bed and dressed himself; then he mounted a horse and dashed away into the mud and rain.

On the same day Rodney wrote to his friend, Colonel Haslet, of Dover, an account of what Congress had done. I imagine he did not mention his long ride, for heroes are ever modest, sometimes distressingly so.

'I congratulate you, sir,' Haslet replied, 'on the important day which restores to every American his birthright. It is a day which every freeman will record with gratitude and of which the millions of our posterity will read with rapture.'

A true prophecy! It was a prophetic era or age, however, as many persons were trying to look into the future and trying to give words to their emotions. Rodney was one of these as, after he had been made a brigadier general and the battle of Princeton had been successfully fought, he said: 'While Washington survives, the great American cause cannot die. His abilities seem to be fully equal to the public spirit that called him forth. History does not furnish you with a greater piece of generalship than he exhibited. We shall soon put an end to the dreadful controversy that agitates and distracts us. In return we shall have peace, liberty and safety. Heaven! what a glorious figure in the eyes of men and angels will this vast American world exhibit in its free, independent state. Nothing will then be wanting but better men and wiser measures to make us a happy people.

'I have been perfectly well in health since I left home. I assure you that I begin to play the general most surprisingly. I would not have you suppose I mean the fighting general. That is a part of my duty I have not yet been called upon to discharge. When called, I trust I shall not disgrace the American cause, for 'tis glorious even to die in a good cause.'

After Caesar Rodney became head of the Delaware government, Washington wrote him several letters for supplies urgently needed and for the collection of taxes. Often on the point of disbanding, the army existed on half or third rations, sometimes with only one day of that ahead and no prospect of obtaining more.

'Our magazines,' Washington explained on one occasion, 'are absolutely

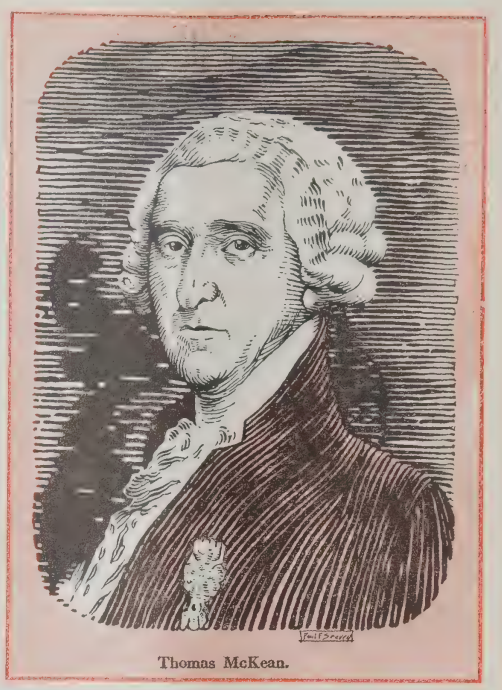
empty everywhere, and our commissaries entirely destitute of money or credit to replenish them. We have never experienced a like extremity at any period of the war.'

The hero of the eighty-mile ride promised to do everything in his power. He expected that the flour would 'come high because those termed speculators are as thick and as industrious as bees and as active and wicked as the devil himself.' He doubted whether any of the taxes had been paid into the treasury, but he would get in touch with the treasurer as soon as it was possible and hoped to 'hear from him in a few days and will immediately let you know.'

When Rodney was sitting in Congress, the Virginia delegates had such a habit of boasting about their state that the other members called this manifestation 'dominionism.' Benjamin Harrison was probably the worst offender, but Rodney decisively cured him. Harrison often referred to the 'abundant and powerful resources of that meritorious member of our Union,' and he exaggerated otherwise. One day Harrison became truly fearful, introduced a demand for supplies of arms, munitions of war of various kinds, troops and general assistance; he declared the state destitute in nearly every respect. Silence ensued when he sat down. Then Rodney arose. He deplored the melancholy and prostrate condition of his neighboring, extensive and heretofore 'powerful' State of Virginia.

Caesar Rodney.

'Let her be of good cheer,' he confidently exclaimed in a loud voice. 'She has a friend in her hour of need. Delaware will take her under its strong protection and insure her safety.'



Delaware was, of course, one of the smallest states with Virginia one of the largest. This contrast and the implied comparison of the mother hen taking the chicken under its wing appealed to the delegates' sense of the ridiculous. Astounded at first, Harrison then saw the humor of the proposal and joined in the laughter that followed. As a matter of fact, all of the states were in distress; it could not be other than amusing for little Delaware to offer her aid when circumstances were trying the very souls of men and governments.

Thomas McKean, who had sent for Rodney when his colleague's vote was required to swing Delaware onto the independence band-wagon, had the distinction of being the only Signer to remain in Congress, without an intermission, from the time of its opening in 1774 until after the preliminaries of peace were concluded in 1783.

Another peculiar fact stands out in McKean's career: he served two states and the nation at the same time. After his appointment to Congress in 1774 he moved out of Delaware and lived at Philadelphia. He was continuously returned to Congress as one of the Delaware delegates, and during a part of the time he also held the office of governor, or president, of the state. By virtue of his residence in Philadelphia, the State of Pennsylvania claimed him as one of its citizens; it honored him by making him chief justice. In 1779 he penned a letter to his good friend, John Adams, and in that communication he mentioned his double capacity, which really was triple through his membership in Congress.

'I had,' he asserted, 'my full shares of anxieties, cares and troubles on the present war. For some time I was obliged to act as President of Delaware and as Chief Justice of Pennsylvania. General Howe had just landed (August, 1777) at the head of the Elk River when I undertook to discharge these two important trusts. The consequence was, to be hunted like a fox by the enemy and envied by those who ought to have been my friends. I was compelled to remove my family five times in a few months, and at last fixed them in a little log hut on the banks of the Susquehanna more than one hundred miles from this place. But safety was not to be found there, as they were soon obliged to remove again on account of the incursion of the Indians.'

McKean was selected to help form a constitution for the State of Delaware.

Thomas McKean.

He was then in Congress but departed immediately after being told of his new duty. A gentleman representing the committee met him and asked him to write the constitution. Although fatigued from his long ride, he consented and went at once to his room in the tavern. There he burned the midnight oil and sat up, according to the story, all night. Having prepared it without a book or assistance of any kind, he offered it the next morning to the house, where it received the great honor of unanimous adoption.

Though the patriot was not a member of the convention which framed the Federal Constitution, he watched the proceedings with interest, observed the character of the delegates and wrote of their activities. In a letter to John Adams he expressed his opposition to constitutional amendments. 'In general,' he averred, 'I dislike innovations, especially in the administration of justice. I would avoid tampering with constitutions of government as with edged tools.'

As governor of Pennsylvania in 1799 he frankly advocated the spoils system of displacing officeholders and installing the victors, practised it extensively and said in extenuation of his acts, 'It is out of the common order of nature to prefer enemies to friends.' He also asserted, 'A dagger ought not to be put into the hands of an assassin,' also, 'I am sorry that I did not displace ten or eleven more.'

In 1807-1808 the governor underwent an impeachment that sprang almost wholly from party rivalry. In his defense McKean avowed:

'No act of my public life was ever done from a corrupt motive nor without a deliberate opinion that the act was lawful and proper within itself.'

When McKean resigned from the

presidency of Congress in 1781, he received the thanks of that body for 'his conduct in the chair and in the execution of public business.' This man of many positions declined, however, to become a candidate for the office of vice-president with Jefferson many years later; his declination was based on both public and private considerations and I presume his age, sixty-six, was an important factor.

Perhaps McKean's most famous remark was made during the deliberations of the

GEORGE READ

convention which framed the Federal Constitution. Noting the trend toward the opinion that the people should be jealous of conferring power on any man or body of men, he cleverly commented that 'we seem afraid to enable any one to do good lest he should do evil.'

The last person to sign the Declaration of Independence was none other than Thomas McKean. There must have been too much confusion at the time. Anyhow, he thought that he had attached his name on the second day of August, 1776, when his compatriots formally signed the document; yet no record of such action shows on the journals of Congress. Apparently his signature was not inscribed upon the official copy until 1781, fully five years afterward.

*Read Was a True Patriot*

George Read, the Delaware delegate that did not favor independence, was nevertheless intensely patriotic and true blue in his loyalty to the American cause. He considered the Declaration inexpedient at that time, also he believed the instructions from his constituents were insufficient to authorize his vote to be cast as McKean desired. When the matter received the sanction of Congress, however, Read not only firmly and zealously supported it but he also attached his name.

'You have put a halter around your neck,' one of the other Signers laughingly taunted him.

'So be it,' the fearless patriot rejoined. 'I am prepared to meet all consequences of this just act.'

The war made life hard for Read. His home was confiscated by the enemy, his wife was taken captive and he was driven from place to place for six years. In 1777 he and President McKinley, of Delaware, left Philadelphia to go to their homes. McKinley took one route, and Read took another, but McKinley was captured while Read managed to outwit the enemy and escape. It was a gloomy time too, with the army encamped at Valley Forge and destined to undergo that rigorous, heart-killing winter of 1777-1778.

'I own the prospect is rather gloomy,' Read wrote at this time to his friend and compatriot, Thomas McKean, 'but we are not despairing. No man is in a more difficult and unlucky situation than myself. Without any fixed habitation in the state, with little assistance or prospect of assistance, in want of health and ability of body—I will not add mind, though also true, lest I be suspected of seeking a compliment.'

The keynote of that letter was 'we are not despairing.' The fathers of the new nation, or the nation about-to-be, had a high courage that tided them over periods of privation and defeat; if they had not possessed this remarkable fortitude, theirs would very probably have been a lost cause.

Though almost alone, Read openly and vigorously opposed the adoption of the Declaration of Independence on the ground that the time was not yet ripe for such action. If one is inclined to doubt his patriotism, do not forget that Read became one of the most strenuous advocates of independence after the resolution had been passed. And subsequently he introduced a resolution of his own, one that left no doubt of his intense loyalty.

'Resolved,' Read's measure proposed, 'that any one who shall willfully break this agreement shall have his name published in the Public Newspapers as a betrayer of the civil rights of America and forever after be deemed infamous and a traitor.'

Read was especially distinguished as a judge. At the time when he became chief justice of Delaware, the position particularly required a man of integrity. The period after the close of the Revolution was one marked with perplexity and confusion; the laws had been silent amid the din of arms and fighting. So the duty of the judge consisted of reorganizing the whole legal system after the chaos, a task which he performed splendidly.

No blemish, it is said, was ever discovered in Read's public conduct. The epitaph of Matthew Thornton, of New Hampshire, is 'An Honest Man'; George Read's ought to be 'A Just Man.'

Certainly the three Delaware Signers were a group of worthy battlers for the rights of the people.

This is one of a series of articles by Mr. Lowden. In next week's issue he will take up the Signers from Rhode Island and South Carolina.

# Originality Is the Aim of the Modern Artist

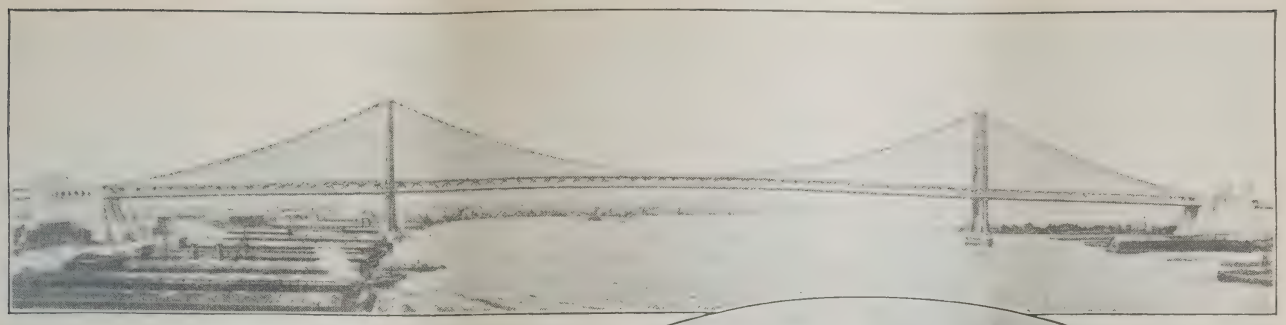
(*Concluded from page 15*)

and criticisms of contemporaries, or the events of more modern times, which we or our fathers have witnessed—the early days of the great 19th Century musicians, or of realism and impressionism in France. Their first appearance caused a stir, yet the small circle of early followers quickly encircled the world in the course of one or two generations.

'This latest movement in art has perhaps even more violent adversaries than those who fought against the masters of the Barbizon school or against the Impressionists. Perhaps the conditions of understanding are more difficult than they were in those movements of the past. Only he who does not see the extraordinary break of history caused by the war, by its antecedents and its consequences, can expect that art, this mirror of the nations, will continue in its normal way as it did during the preceding generations.

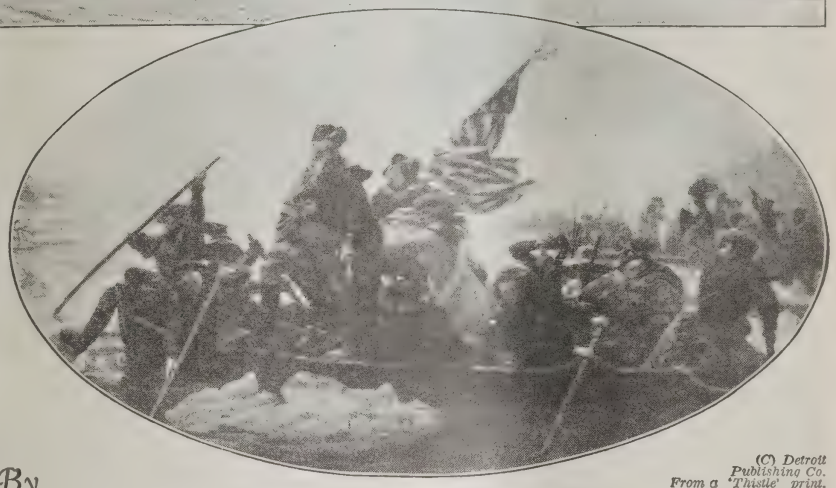
*Art Through the Various Ages*

'The art of the 17th Century went on developing naturalism in portrait, genre, and landscape painting. The art of the 18th Century pushed further the neglect of the spiritual side in favor of the decorative, superficial style of painting. In the Impressionist movement, the art of the 19th Century reached the most perfect rendering of the most external appearance of things. It knew how to project, as if by magic, even air, light, and movement on the canvas. But nothing had remained of the spiritual content, which does not show itself in the outer surface of nature, but seems to lie behind the objects and seems only to look forth here and there as if through a window, from the beyond into the now.



'Assyrian and Egyptian civilizations belong to the periods of abstract art, which were developed into the naturalistic Greek and Roman art. Opposed to this there appeared again for a period of about five hundred years the art of the Middle Ages, with its abstract style. In its place there came once more, for about five hundred years, a naturalistic art which began with the Renaissance, and now seems to have come to its end.

'The great problem of all abstract and spiritual art is to abandon a facile rendering of space, such as is obtained by photographs. Primitive art aims at a strong simplification of the image seen by the eye, in which only such elements are accentuated as express clearly the inner life; for instance, the expression of an eye, of a drastic movement, and so forth. By omitting all superfluous details of the appearance, the essential content of the composition becomes clearer. A certain conventionalization of the form is a characteristic of all abstract, spiritual art. The intention is to impress the spectator with higher spiritual laws. At the same time, a more intense decorative and architectonic character is obtained in this art, for it does not break through a wall as does the window perspective of a naturalistic art.

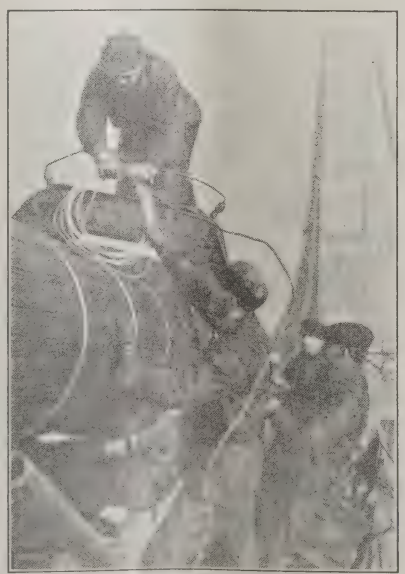


'Primitive art accentuates the wall and decorates it with colors and rhythms of lines. To designate this conception of form, expressions such as 'Cubism,' 'Futurism,' and so on, have been coined, which, fundamentally, mean nothing. The artist who uses this art of simplification is a true artist or an imitator. It makes no difference to which movement this artist belongs, whether he is an Expressionist, a Cubist or a Futurist. If a true artist, such as Mattisse, or Arthur B. Davies, uses simplification, he will manifest always his personality. Only a superficial spectator doubts the artist who proves his individuality by this very wrestling with the problem of his period.'

Pablo Picasso, one of the leading Cubists, who is at the same time an able painter in the academic fashion, declares that he cannot understand the value of argument regarding the differentiation between naturalism and art.

However, today's art is as clearly defined by these authorities as they define the art of the ancients, of the Barbizon school and the Renaissance, and the art of the Impressionists. It is the more cerebral art of painting with the mind, rather than with the eye.

# Crossing the Delaware, 1776-1926



(C) Detroit Publishing Co. From a 'Thistle' print.

Above—Delaware River suspension bridge, longest in the world. Oval—*Washington Crossing the Delaware*, December, 1776. After the painting by Emanuel Leutze.

By C. L. NORTON

A GREAT steel wire suspension bridge would have meant much to George Washington and the cause of independence in 1776. With a total population in the newly formed United States of 2,810,000 (about as many as are now in the city of Philadelphia alone), it was obviously impossible to have such a bridge even if the justifying need and necessary funds ($32,783,000) had been available—which they were not. Indeed, 150 years ago there was no such thing as steel or galvanized wire; and cables thirty inches in diameter were not only unnecessary but, by reason of that fact, undreamed of.

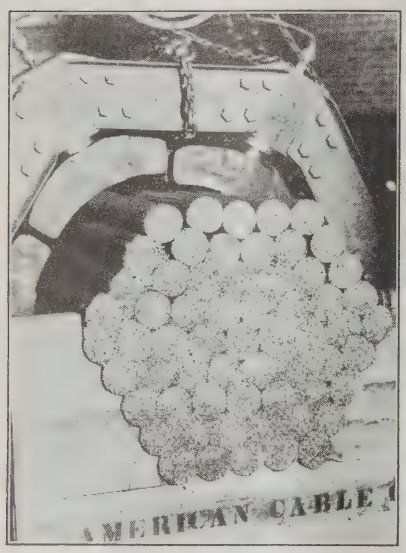
'These are times that try men's souls,' said Thomas Paine in a letter commenting on the trials of the Colonial revolutionists, written to Washington during the early part of 1776. The words took on added meaning with each month that followed, reaching their peak perhaps on Christmas night of that year when Washington took 2,400 ill-clad and half-starved men, guns, horses and paraphernalia across the swift and treacherous Delaware River that was filled with cakes of floating ice, surprised the reveling Hessians, took 950 prisoners, and succeeded in killing seventeen and wounding eighty of the enemy. This he did at the cost of only two men and four wounded and in spite of a driving storm of snow and sleet that rendered much of his ammunition useless. Then, as a fitting climax to his successful daring, he recrossed the icy Delaware that evening with all his prisoners and captured guns.

Workmen high up on the Delaware bridge, squeezing cable preparatory to wrapping with wire.

The need of bridging these waters has now been met with the erection of the longest suspension bridge in the world, a bridge that is 9,500 feet in length, 135 feet wide, 385 feet high, and with a suspension span of 1,750 feet. This bridge is, in itself, an outstanding example of the progress of the American people during the 150-year period between 1776 and 1926.

On Independence Day, 1926, at Philadelphia, by the pressing of an electric button, this obstacle of the river of 150 years' standing will be overcome and New Jersey and Pennsylvania residents will be enabled to fraternize with the ease and completeness common to the other metropolitan twins, New York and Brooklyn, the two Kansas Cities, the two St. Louises, Minneapolis and St. Paul or Omaha and Council Bluffs.

Beginning that day, workingmen of Philadelphia can drive to the ocean beaches and the truck farmer of New Jersey can reach his Philadelphia market direct—all in one-tenth the time formerly required and one-fifth the expense. Beginning July fourth, 6,000 automobiles an hour can cross the Washington-famed waters, in company with four lines of rail traffic and two 10-foot-wide streams of pedestrians. In this way the social and economic importance of the new bridge will force into oblivion the necessary expenditure of nearly 33 million dollars and force the structure to take its place as the principal factor in the future growth and development of the two cities and surrounding territory.



From the engineering standpoint the new Delaware bridge is a 20th Century marvel. It excels in every way all previous records in bridge building. For many years the Brooklyn bridge at New York City held first place in suspension construction. The span of the Delaware bridge, however, is 155 feet longer and its travel capacity much greater. The two finely woven, steel wire cables of the Delaware bridge are 30 inches in diameter (18,666 strands of wire each) as against four cables 15½ inches in diameter for the Brooklyn bridge. These two enormous cables will bear easily, and for an indefinite period, 12,000 pounds of load per lineal foot of bridge. When it is realized that the bridge is a mile and a quarter in length, the magnitude of the load can be but vaguely appreciated.

All of the wire used in the weaving of these enormous cables, if stretched out in one piece, would be 25,100 miles long—sufficient to encircle the earth at the equator and have enough over to stretch from Pittsburgh to New York.

The suspender ropes, extending from the two main cables to the floor of the bridge, number 596. These alone have a total weight of 7,400 tons, while the floor which they support, made of steel and reinforced concrete, adds another enormous dead weight to the main cables. At the abutments, where the bridge floor and cables meet, there was another engineering problem

encountered in the anchoring of the enormous cables, but this was successfully accomplished.

Ralph Modjeski, chief engineer of the bridge, was born in Cracow, Poland, in 1861. His father was Sinnmayor Modrzejewski and his mother's maiden name was Helena Opid. She changed her name to that of Modjeska upon becoming a citizen of the United States. She made her home in America and attained international fame as a dramatic artist.

Cross section of cable used in the Delaware River bridge. The cable consists of 61 strands of 306 wires each.

Chief Engineer Modjeski was naturalized an American citizen in 1883.

The first large bridge designed and constructed by him was the government bridge at Rock Island, Illinois, over the Mississippi River, which is a double-track railway and highway structure. Then followed the reconstruction of the Bismarck bridge at Bismarck, North Dakota, over the Missouri River, and later the Thebes bridge, over the Mississippi River at Thebes, Illinois. Then followed numerous other structures, the cost of which reached an aggregate of forty million dollars.

Mr. Modjeski was a member of the board of engineers appointed by the Dominion Government of Canada for the reconstruction of the Quebec bridge, the the longest span of any cantilever bridge in the world.

Chain suspension bridges date back to the year 1667, the first, which was erected in China, consisting of 20 chains.

Philadelphia holds a unique place in the history of wire suspension bridges. The first wire cable suspension bridge in the world was erected in 1816. It was a 'foot bridge across the river at the Falls of Schuylkill above Philadelphia, whose cables were of 6 wires, ⅜ inches in diameter, and so a new epoch of development was instituted. The span of this structure was 408 feet; its cost was $125; a toll of one cent was charged for passage, and only eight passengers were allowed upon it at one time.'

***The First Wire Bridge***

Thus did Philadelphia start 'a new epoch of development' with the erection of the bridge across the Schuylkill and then, 110 years later, extend that development with the erection of the present magnificent structure.

# Movie Patrons Make Coolidge Think

(*Concluded from page 5*)

neither make nor approve the troubles of Europe. With much that passes for governmental wisdom in Europe we highly disapprove. Why should we take part of the consequences of acts that we do not endorse? We believe the European way of doing things is in many respects a very bad way. When European methods bring hostilities why should we be held responsible for the situation?

We are told that this is selfishness. We are not so much concerned, however, as to whether this is selfishness as we are as to whether it is sense. If it be selfishness, it was selfish for our ancestors to quit Europe and its quarrels and come to America for peace. We have made somewhat of a success of civilization in America partly because we have not followed European ways. Behaving ourselves and minding our own business have helped to make us what we are. Not that we are so much. Not that we are better than anybody else. We are not Pharisees. But we believe in minding our own business and keeping the peace.

Washington was right. He warned us not to become embroiled in the affairs of Europe. Nobody yet has the nerve to say Washington was wrong, but they say times have changed. The affairs of peoples have become so interwoven—and so on, and so on, and so on. The commercial affairs of the peoples of the world have become somewhat interwoven. What of it? Is that any reason why we should pledge ourselves in advance to participate in Europe's wars? What harm can a war in Europe do us except to injure our trade? Is trade worth going to war to preserve? What guaranty have we that we could ever preserve our trade by going to war? Going into the Great War did not preserve the trade of any nation that took part in it.

***War Is a Trade Killer***

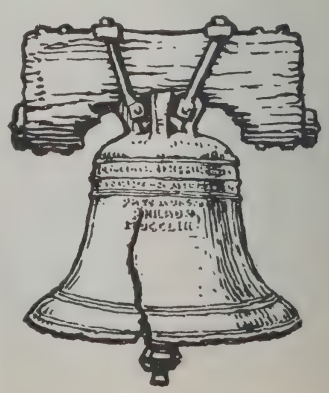
War is a trade-killer for everybody. It kills even the trade of neutrals by killing their customers and impoverishing those whom it does not kill. Furthermore, what about the morality of going to war to preserve trade? Who wants to be killed to preserve somebody else's market—or even his own? What trade-loss can equal a war-loss? Why not take the trade-loss, if one should come as the result of another European war, neither kill nor be killed, add nothing to the national debt, and trust that we shall be able to worry along after the war is over?

What, except the internationalization of capital, has changed since Washington's day? Steamships, submarines, airplanes and dirigibles. Admitted. What do they change? Do they make our position here so insecure that we should try to establish a first line of defense in Europe?

But should we not give Europe the benefit of our 'disinterested advice'? Should we not try to help our transatlantic friends solve their problems?

Every friend of the World Court and the League of Nations thinks so.

But let us look these things in the eye.



In the first place, what do we know about European affairs? How much do we know about the hatreds, jealousies and rivalries that usually cause European wars? Do you know what caused the war between Schleswig-Holstein and Denmark? Bismarck said that only two men ever knew what caused that war and that one of them was dead. What caused the war between France and Germany in 1870? Everybody knows some of the reasons, but Professor Charles D. Hazen in his *Europe Since 1815* said ten years ago that the truth probably would not all come out for many more years. How much do you know about the involved politics and hatreds of the Balkan States—the tinder-box of Europe? If you were representing America on the League of Nations what could you contribute to the settling of these age-old Balkan animosities? How much could any American do? Do you know that some of the American peace commissioners had to ask where were certain cities and communities with which they had to deal? Do you know that even Lloyd George's geography ran aground? And, furthermore, what reason have you to suppose that Europe wants our advice in the settlement of her troubles? Can you mention any European statesmen who seem to be suffering from an inferiority complex? Do we want the advice of Europeans about the settlement of our problems in this hemisphere? Is it likely that Europeans feel less able to deal with their own affairs than we feel to deal with ours? Europe does not want our advice, disinterested or otherwise.

***Europe Wants Nothing But Money***

Europe, in peace-times, wants nothing from us but money and a great deal of it. That is all right, but we might as well get the facts straight in our minds.

We are the last people in the world who ought to talk about going into a League of Nations. We are too individualistic—too sure of ourselves and too determined to manage our own affairs. The Senate's reservations forbid the World Court to tell us what to do—or rather tells it to keep its hands off our affairs. Nobody who knows America can imagine it bending to the decree of the League of Nations. Perhaps we should have more of a world-sense, but we haven't got it. We are a nation of intense nationalists.

The truth as to how we stand on these matters is beginning to come in from the elections. Senator McKinley, of Illinois, who voted for the World Court, was recently defeated for reëlection. The two Indiana senators who voted against it were reëlected. Every time the American people have had a chance to vote on this question they have voted for Washington and against whoever represented the other side.

# CHATS WITH OFFICE CALLERS

'President Coolidge shows a most amazing lack of staying qualities,' said ***The Man From Washington,*** 'and his own Cabinet feels little compunction in disagreeing with him openly. The President said in a recent speech that he had reduced taxes all he could; next day Mr. Mellon issued a statement flatly disagreeing with the President.

'Then came the now famous dry order, which permitted local officials to act as Federal officers in the enforcement of the Prohibition law. The order was perfectly legal and was entirely justifiable by the circumstances. In a word, Mr. Coolidge did the right thing. But even before the news of it reached the country, the President was a-heming and a-hawing, explaining that he didn't mean it this way or that way, and so on. Somebody in Washington squawked and the President pulled in his order without waiting for the country's reaction to it. In two days the mails began to come in showing that the order was immensely popular with the people. The President was congratulated by the people on his at last taking a stand that promised results. But even before the letters had been posted, the President had pulled in his horns—scared off! It is such things that lower his prestige and give the impression of timidity.

'The dry order was no more than an emphasis of what already exists. Every policeman in every city is sworn to uphold the Constitution of the United States. That puts him in Federal service. The President was creating nothing new. What a glorious chance he missed to stand his ground and fight it out. But he hasn't fought out a single point since he has been in the White House. And people are beginning to suspect that it is because he lacks the stuff to do so.

'At any rate, the President's acceptance of the Mellon rebuke in public and the hasty backdown from the dry order have left a bad taste.'

ɤ ɤ ɤ

'Mental attitude is a funny thing,' said ***The sunburned golfing enthusiast.*** 'Yesterday, for instance, I spent the whole day in the hottest sort of sunshine working like a plow horse and never got tired while my backyard needs attention in the worst way and it makes me actually weary just to think of it. I'll have to figure out a game to play with the lawn mower, hoe and rake; then the necessary task will become attractive.'

ɤ ɤ ɤ

'We always have had a pet lamb, and one year I remember we had seven,' said ***The Farmer-Stockman.*** 'Some of them have become terrible nuisances, follow you all over the place—screen doors don't stop them. I've seen them come right through in an attempt to follow me. The worst part of it is that the other sheep want to follow these pets into the most impossible places. Folks are like that, aren't they? Some become pets and are always going where they are not wanted or doing things they shouldn't do and then the rest think they should follow.'

'How many political parties have we in France?' repeated ***The Former Member of the French Chamber of Deputies*** in response to our query. 'I cannot tell. Ten, maybe, or twenty. I have the exact list somewhere, but I do not remember its number. There are far too many surely. But at that there are not so many as there were before the last election. A large number were—what do you call it?—"swept under" then.

'You see, before the war we were a happy people—too happy. It was easy to earn one's living, and politics was a pastime, a game, pleasant and not a little exciting and full of fun. Men liked to sit in cafés and talk politics and look very wise. As a result we have many politicians. After the war the politicians, to get elected, would make extravagant promises. Each man had to make different promises from his opponents, so each had to belong to a different party. And the man who made the most promises got elected!

'But as time went on the electors began to see that the government could not run on promises alone. The parties of the left would seldom coöperate with those of the right, and concerted action on important matters was almost impossible. And so at the last election the vote swung more to certain parties, and many of the politicians and their parties were dispensed with. Even now, however, we still have too many.'

ɤ ɤ ɤ

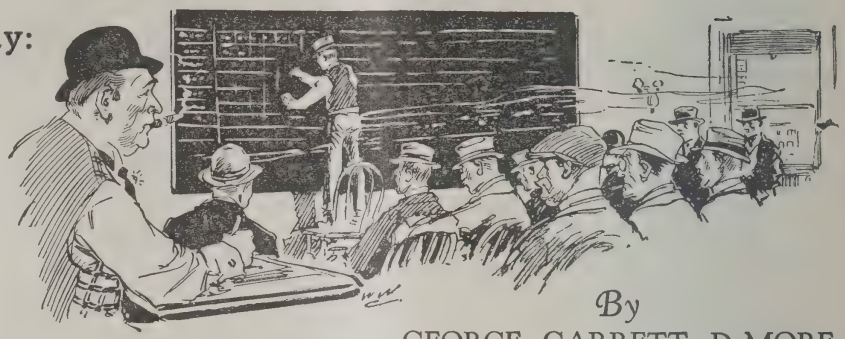
'Any actor who thinks he alone is responsible for his success,' said ***The famous Movie Star,*** 'is crazy. I have seen them go up and I've seen them come down; and believe me they come down a lot faster than they go up. I was a long time on the road up. Before I went into the movies I was on the stage, on it, in fact, far longer than I like to confess, for I'm still supposed to be a "juvenile." My father was an actor before me, and my grandfather and my grandmother. A little while before he died my father called me to him and he said, "Son, I'm dying as a good actor should die—broke." And then he added, "And I think you show talent as an actor."

'If that was any gauge I was a good actor, for I was broke, dead broke, a good many years. I've been on top now for a little while and, frankly, I enjoy it. I like to eat regularly. I like the popularity. I like the praise. *And I want to keep it, all of it.* But I'm not foolish enough to believe it depends on myself alone. There are so many things that enter into a successful picture besides the making; there is so much organization—distribution, exploitation, exhibition. Above all exhibition. The man who shows the picture is the one whose hand is on the pulse of the public. *He knows what the public wants.* Out in Hollywood we are away from the rest of the world. We never see our audiences; we only know how they react to our pictures from the box office receipts. And often that is the worst way to learn. It does us a lot of good to get out over the country once in a while and learn a few things first hand. It makes us less cocky!'

'You may say all you like about women smoking,' said ***The Man Who Travels the Country,*** 'but it is not nearly what you think it is, in extent. Far be it from me to give the slightest insinuation that a perfect lady may not smoke—I know some who do. But they are not the most balanced minded persons in the world—if I may put it that way. They don't see their place as women clearly. A few of them like to smoke, maybe, but most of them do it because they are determined to live up to the utmost of this new "personal liberty" stunt. Rolling your own is like rolling your stockings—you can do it if you want to. But that's not what I wanted to tell you. I was down at Washington during the convention of the Daughters of the American Revolution. I happened to be at three of the principal hotel centers used by the Daughters, so that I saw large numbers of them constantly. I did not see one of them smoking. I doubt if we shall ever see, no matter how far we progress, a general adoption of the habit among women who live in unalienized American surroundings.'

ɤ ɤ ɤ

***The Student of Antiques*** threw a new light on the well-known radical, John Spargo, when to our surprise he remarked: 'Spargo is very conservative, you know; and as a matter of fact he is now vastly more interested in ceramics than in economics. He enjoys "digging" and has done some excellent research work in ceramics. He is now preparing a book on the subject. It will be published in a limited edition shortly, and promises to be quite the finest work of the kind that has appeared.'



ɤ ɤ ɤ

'Thousands of young men and women "commenced" during the past month to check two to seven years theoretical training against the vicissitudes of life which do not always proceed according to theory.' ***The Man for Years Out of College*** was talking. 'For most of them the next two years will have some rough going. The world passed very few of them on "credits"—they will have to go after another degree in practical life. The sensible ones among them will join together the lumber of theory with the nails of experience and build a permanent and useful structure, while some will haul their lumber of theory around looking for nails the balance of their lives. Unfortunately, the value of the college training will be misjudged by this latter class rather than by those who have indicated the ability to utilize it. Some college men are failures, but the percentage is much lower than among the others. And college training cannot be accurately judged by the few who fail.

'A college education does not guarantee a man a better living, but it should give him a better life. A college-bred couple living on an ordinary salary should be living a more satisfactory kind of life than if they had less vision, less acquaintance with the better things of life.'

# Bucking the Modern Bucket Shop

## There Is Only One Way: Avoid Shady Brokerage Houses and Speculation

By GEORGE GARRETT DeMORE

THE difference between blackboard betting on stock prices, which prevailed in the eighties and early nineties, and modern bucket-shop practice is the difference between a gambling chance and inevitable loss through swindle.

The swaggering proprietors of old-time bucket shops were, after a manner, sportsmen. They were content to allow their clients to 'break themselves' through ignorance, greed and misplaced hope. Often they encouraged a few customers to win; it was a good advertisement.

But the coat of arms of the 'Old Oaken Bucket' has descended to a generation lacking even a mixture of sporting blood to atone for the sins committed in the name of finance. In a modern bucket shop the customer has not a ghost of a chance.

The equipment of a bucket shop of the nineties was meager. A blackboard, upon which were quoted the changes in the price of New York securities between the hours of ten and four, a telegraph wire over which the quotations were received, a cashier's cage and a safe of ample proportions, these were all the furnishings needed, though the better-class places provided easy chairs in which the customer reclined while watching the fluctuations of the prices.

The client could either buy or sell at the price quoted on the board. There was no pretense that orders would be executed on the exchange or that actual delivery of the securities would be made.

The commission was one-fourth a point, or twenty-five cents a share. One hundred dollars bought one hundred shares, or a ticket on which was inscribed this amount. If the stock declined three-quarters of a point—seventy-five cents a share—the client was wiped out, twenty-five cents a share being deducted as commission. If the stock advanced three-quarters of a point and the customer called 'closed' before a new quotation came over the wire, he received one-half a point or fifty cents a share, one-quarter on all transactions being taken by the bucketeers.

Operating in this manner, there were no additional calls for margin and the customer could only lose his original one hundred dollars, while his chances for profit were limited to only the advance in the stock, a rise of nine points being equal to $675.

***Lucky Customers Were Charged Higher Commission***

When a customer showed ability to guess advances and declines, the bucketeer would tack on an additional commission of one-quarter of a point, taking fifty cents a share. In cases of extreme luck or sagacity in picking winners, a penalty of one to three points would be laid down, the stock sometimes having to advance three and one-fourth points before the customer made any profit.

It was a simple game and quickly won popularity. In fact it became so widespread that the stock exchanges of the large cities began to despair of making a profit for themselves and restricted the use of their quotations to members who actually dealt in the securities quoted.

As is known, in ninety out of a hundred transactions in futures on a commodity exchange or stocks on a securities exchange, buying orders cancel selling orders and no delivery is made nor, in the opinion of all parties concerned, is necessary

The old shops had something of romance about them, born of many exciting scenes which have become financial traditions. At least one of the greatest speculators and financiers of the present generation got his start in the old-time bucket shops. But these gambling shops which frankly admitted their purpose were doomed to fall. It came about when the New York Stock Exchange rigidly controlled quotations to keep them from all except exchange members.

The bucket shop passed into financial history only to come back like the traditional Jewish clothing store after the fire—with a new front. This time it donned the dress of the regular broker. In faith the bucketeers even went the honest brokers one better, so magnificent in furnishings were the temples of finance they opened up.

***Old Bucketeers Later Became Regular 'Brokers'***

The rules of the New York Stock Exchange were somewhat too severe for the new bucketeers; besides, the old-timers, constituting virtually a financial oligarchy, looked askance on the new fly-by-nighters with their showy fronts and did not encourage them to purchase stock exchange seats at $80,000 to $100,000 each. Legitimate finance—to coin a phrase to differentiate between high and low—had the cards stacked in its favor, had early bent the laws to its aid, and was possessed of a regular annual income from the lambs of Wall Street. It had no selfish reason for receiving the new generation of bucketeers with open arms.

But there remained the New York Curb Exchange, the Consolidated Stock Exchange, and even that venerable institution, the Boston Stock Exchange, home of the 'Coppers.' And in any event the good bucket shop did not need to be a member of an exchange to fleece the lambs. All it needed was a pretentious office and a list of 'suckers.'

The offices were purchased as close to Wall Street as possible, some even finding location on the street of magic name. Next, the clerks of investment houses were bribed for lists of customers with good healthy bank accounts and high-grade bonds, preferably government bonds.

With a list of 'suckers' the bucketeer sends out bales of highly decorated and extravagantly worded literature. He advertises in all newspapers and periodicals that haven't live financial editors to checkmate the scheme by showing the rating of the new 'brokerage' concern on past performance under a former name to the advertising office and keeping out of the conservative column the enticing 'come-ons' of the bucketeer.

This is followed up by telegrams and telephone calls. A business man in a city one hundred or more miles from New York is sometimes flattered by being called long distance from Wall Street.

When the orders for stock come in, the bucketeer can operate in two ways. He can purchase the shares through another house, at the same time giving an order to sell at the identical price, and so pocket the customer's money, or he can use the securities as collateral for a cash loan or to play the market. Either is disastrous to the customer.

The bucket shop always encourages the client to buy on a small margin. The thinner his shoe string, the more quickly will he probably be wiped out and the less likely will he be to call for delivery of stocks. Above all else, the bucketeer desires to keep the client from wanting to take his stocks up, for when this is carried on to any extent it calls for a show-down and the bucketeer, if pressed, must go out of business.

The modern bucket shop resembles the mushroom in its seasonal springing up and ephemeral existence. When a 'bull market' period of rising prices has been in progress and the public attention is drawn to the stock market, the bucketeer opens shop. It is his aim to get his customers loaded up with stocks at high prices, and when they fall he can buy them in at cheaper prices and be ready to deliver if called upon and so keep in business until the next 'bull market' and have a greater number of customers than before. Most bucket shops last only one period of rising prices. They can't deliver securities when called upon, in most instances, and become insolvent.

***Age Is One Test to Apply to Brokerage Houses***

A test of a brokerage company is its age. The mortality of concerns which have operated a decade or more is slight compared with recent comers in the financial world.

If you would stay away from bucket shops, pick the companies dating from before the war and choose only a broker recommended by your banker.

An investor should never buy stocks on a margin. That is the province of the speculator, and few are those with reason or talent to speculate. Beware of the unsolicited letter or telegram regarding securities, and also of the front-door peddler with his limousine or sporty roadster waiting to waft him to the bank with your check.

# Uncle Sam and the Baby Crop

(*Concluded from page 3*)

consisting of the chief of the Children's Bureau, the Surgeon General in charge of the Public Health Service and the United States Commissioner of Education. This board passes on general policies.

Second—The Children's Bureau and that division of it which has to do with administering the Maternity Act. This intermediary passes on 'plans,' collects general data, prepares literature, develops standards, audits the accounts of state agencies and gives general supervision to operations throughout the country.

Third—The state government bureaus designated by the legislatures as connecting links between Washington and district or local agencies.

Fourth—The field forces of state bureaus and, when used, local agencies.

Alabama gets from the Federal Treasury the sum of $25,836.95 a year for this work, or not more than twenty-five cents for each child born in the state.

When the aid finally reaches, if it does at all, the Alabama mother-to-be, or an infant in that state, such may consist of a variety of things. It may be printed advice; it may be a prenatal conference, attended by the mother along with others; it may be a child welfare conference. At these the women or children may be examined. The aid may partake of a home visit by a public health nurse employed under the Maternity Act. It may be indirect aid, in the form, for instance, of attention given to midwifery.

***The Annual Crop of Babies***

Take New York State for more detailed illustration. This state is selected for the reason that it adds to the Federal funds considerably more than required by the Maternity Act.

The staff engaged for the work consists of: A director, an associate director (physician), an executive clerk (physician), 4 physicians, 23 staff nurses (and 24 part-time maternity and infancy community nurses employed from Maternity Act and local funds), 3 county nurses, 2 midwife inspectors (nurses), 1 organizing field agent, 1 office manager, 4 clerks, 8 stenographers, 1 advance agent and 1 chauffeur.

In that state 233,678 infants were born during the year of 1924. Necessarily both mothers and infants have to be dealt with largely en masse. In addition to conferences, campaigns and propaganda in general, there were 10,326 home visits by nurses to give prenatal or postpartum instruction and 37,443 to give instruction as to the care of pre-school children.

The last report covering the item states that all told 595 public health nurses are employed under the act in the country. Approximately 2,500,000 births take place in the country every year. Thus there is one Maternity Act nurse for about every 4,200 births. There are probably about 100 physicians in full-time employment under the act, or about one for every 25,000 births.

Many of both nurses and physicians may represent only transference from other agencies. Before the act was passed Red Cross agencies were employing from 1,300 to 1,500 public health nurses. They now employ fewer than nine hundred.

The forces employed under the Maternity Act are infinitesimal as compared with the number of women who at all times are expectant mothers and that of infants making up the ever-present 'baby crop.'

Only a few of the states have done more by way of funds than is required of them by the act. Just what the effect has been on local community effort is beyond determination here.

When the Federal Government takes up an activity, the inclination of others who might be concerned is to hands off.

One of the big objections to the Federal Government taking an authoritative hand in the promotion of the welfare of the 'baby crop' is that local effort, which naturally when put forth is most effective, may be more stifled than stimulated.

Four of the states—Connecticut, Illinois, Maine and Massachusetts—have refused to have aught to do with the Federal Maternity Act. One, Vermont, accepts only that portion of proffered funds which is offered without 'strings' and thus also operates independently.

When the original fight over the question was underway, proponents of the Maternity Bill charged that 'During the delay by Congress approximately 625,000 babies have died from causes (chiefly preventable) prenatal or connected with childbirth and infancy.'

***Infant Mortality Has Not Changed***

The implication was that operation of the measure would have saved many, if not most, of those infants. The project has been operating for a period four times as long as that of the 'delay.' How many have been saved?

Available statistics indicate that infant mortality is just about the same as it would be had no Maternity Bill been passed. The rate has gone down a little, just as it was decreasing for a long time before there was any Maternity Act.

The infant mortality rate has gone down as much, probably a little more, in the states that have had naught to do with the Maternity Act as in those as a whole where the act has been effective.

There is no evidence that operations under the act have produced a sum of favorable results which otherwise would not have been achieved, though unquestionably much of the work done under the act has been good and no doubt effective. And, especially in view of the fact that the act has been 'on trial' with renewal necessary to its continuance, the nationalized operations have been carried on circumspectly.

***What Will Become of This Policy?***

Yet at least one community has revolted against these operations and refused all help offered it via the act.

The people of that community, as do those of the states which have refused to accept this Federal 'aid,' hold that they should and can attend to the problem without interference from Washington.

So the question as it stands is, despite four years' experience with the act, much as it was in the beginning. And the kernel of the question is—

What may come of a policy of Federal Government meddling—via a Washington bureau having power and large funds—with a subject so intimate, so delicate, so local and withal so important to the individual as child-bearing and rearing?

# I Read in the Papers

### *Frankau's Joke Fell Flat*

The visit to these shores of Gilbert Frankau, Semitic author-lecturer from England who has for some reason of his own retained his war-time title of captain has not been particularly successful in spite of strenuous press-agenting. Heralding his arrival, a New York publishing house sent out the following telegram to various newspapers throughout the country: 'Gilbert Frankau, famous English novelist-publicist, arrives your city——(date). He has been besieged by press in cities visited thus far, as he talks *sensational* copy on international relationship and women.'

A sample of the 'sensational copy' was related in *Time:*

'Last fortnight Captain Frankau traveled to St. Louis. It seemed a good place to proclaim what sound old Tories were thinking over their port in the London clubs. Incidentally, a convention of U. S. booksellers was in session there, to whom Frankau, who maintains that the national significance of his novels has impressed "every one who can read in the British Isles," would just say a word or two.

'But before the moment arrived for the booksellers' toastmaster to introduce the unofficial representative of British Conservatism, that individual was overcome by the occasion. The hospitality had been too perfect. He arose in the midst of another speaker's remarks, waved a glass of ginger ale recklessly aloft and said: "Let's stop all this speech-making! Let's get on with the dance! . . . I'm too full for utterance . . . but there's one thing I'd like to say. It is a trifle strong; illustrating what is wrong with your country. Before I tell it, any ladies not feeling very strong had best come and have some, er, ginger ale."

'No ladies drew near him, however, so Captain Frankau proceeded to relate a "joke" which connoisseurs present declared was ancient, somewhat pointless and entirely offensive.

'In London, hearing this news and wondering how "that little writer chap" had ever been mistaken in the States for an official Conservative representative, Conservatives were irked.'

---

In a recent issue THE DEARBORN INDEPENDENT reprinted the following paragraph from an article written by the Rev. Edgar DeWitt Jones, D. D., for the *Detroit News*. The *Detroit News* requested the Reverend Dr. Edgar DeWitt Jones to attend a performance of a current revue, which boasted in its advertising of its high sophistication, and give his impressions of it. Among other things Dr. Jones declared: 'The very clever comedian who "substituted for the village parson" showed a good deal of finesse and was rather funny. Ministers are very human and they make mistakes like other people. Most of the ministers that I know are hard-working fellows, courageous for the most part, and much more tolerant of the frailties of mankind than are their critics. *Still I wonder how long Mr. Shubert and other theatrical managers would last if instead of burlesquing a service in a Protestant chapel, they substituted a Catholic church or a Jewish synagogue. It is truly remarkable how cleverly the stage steers clear of a Catholic priest or a Jewish rabbi and unloads its burlesque on a Protestant preacher ten times out of ten.*'

This called forth a letter to the Editor of the *Detroit News* from a Mr. MacDonald which read as follows:

**Prohibition**

To the Editor: The Rev. Edgar DeWitt Jones, after viewing a frothy revue, among other things was at a loss to understand why a minister was so often caricatured upon the stage, and never a priest or rabbi.

I hesitated to enlighten the Rev. Mr. Jones, being unable to believe that so gifted a scholar and widely traveled author and preacher was honestly ignorant of the cause . . .

As far as my personal observation goes, I have never seen a priest or rabbi make himself ridiculous before the public. Whether they possess it or not, they convey the impression of dignity at all times and are so accorded it. They labor strictly in their own vineyard and are not continuously interfering in other people's business . . .

GEO. F. MacDONALD.
17471 Fairport Avenue.

And this in turn was answered by the Rev. Frank D. Adams, minister of the First Universalist Church of Detroit:

To the Editor: Mr. MacDonald's recent communication, in which he undertakes to explain to the Rev. Dr. Edgar DeWitt Jones why ministers are so often caricatured on the stage, but priests and rabbis never, is not altogether convincing. If Dr. Jones ever asked why this is so, the question must have been purely rhetorical; for I can not believe that he is ignorant of the reason. But Mr. MacDonald's explanation is quite too naïve. He says that priests and rabbis are not caricatured on the stage because they are always dignified, do not make themselves ridiculous, 'and are not continuously interfering in other people's business.' The implication is, of course, that Protestant ministers are often undignified and ridiculous and are continuously interfering in other people's business; therefore, they are made the butt of ridicule on the stage.

The answer is not as simple as all that. Interfering with the business of some people, bootleggers, for instance, will always be part of the job of real ministers. I doubt that even Mr. MacDonald would consent to have them overlook this part of their function. But surely he must know, as Dr. Jones undoubtedly does know, that priests are never caricatured on the stage simply because stage managers and players have been advised that the Catholic Church will not stand for it. If Protestants could get together long enough to serve similar notice upon the Thespians, they would get similar results. As for rabbis, may not their immunity be due to the fact that the show business of today is almost wholly controlled by the people to whom they minister?

REV. FRANK D. ADAMS.
Minister, First Universalist Church.

### *The Ballad of the Milk Bottle*

A really terrible state of affairs exists in the fashionable West End of London. 'During the past few weeks,' runs a news item in the London *Morning Post*, 'the activities of a gang whose specialty is the stealing of bottles of milk and parcels of dairy produce from doorsteps, in the early hours of the morning, have been causing inconvenience to residents and dairymen in the Mayfair and Belgravia districts.' The situation indeed is such as to have provoked Lucio, the inimitable occasional poet of the *Manchester Guardian*, to take the matter in hand—

My Lady in her robes of silk,
Her sobs she has to throttle—
She cannot have her morning milk
For someone's nabbed the bottle.
'I want my milk!' his Lordship cries,
'The day's ideal commencer!'
'Oh, sir!' his trembling man replies,
'It's gone—it's gone again, sir!'

And then, after describing in his own inimitable way the bewilderment of Scotland Yard and the baffled resources of the entire police force, a light suddenly dawns upon him. After all, the matter is simple enough—

I know who makes the milk vamoose
(For that his special groove is)—
It must be Felix broken loose
From some adjacent movies!

---

Albert Parker Fitch, a growing college power in this country, told a group of 'Youth Movement' youngsters:

'*You are lovable, but irresponsible and superficial, and, despite all your radical statements, inherently conservative. Your minds are undisciplined and dissipated. You have impressions of ideas*, but not ideas. A little less intellectual conscience and a little more moral conscience wouldn't hurt.'

# Rare Signatures of the Signers

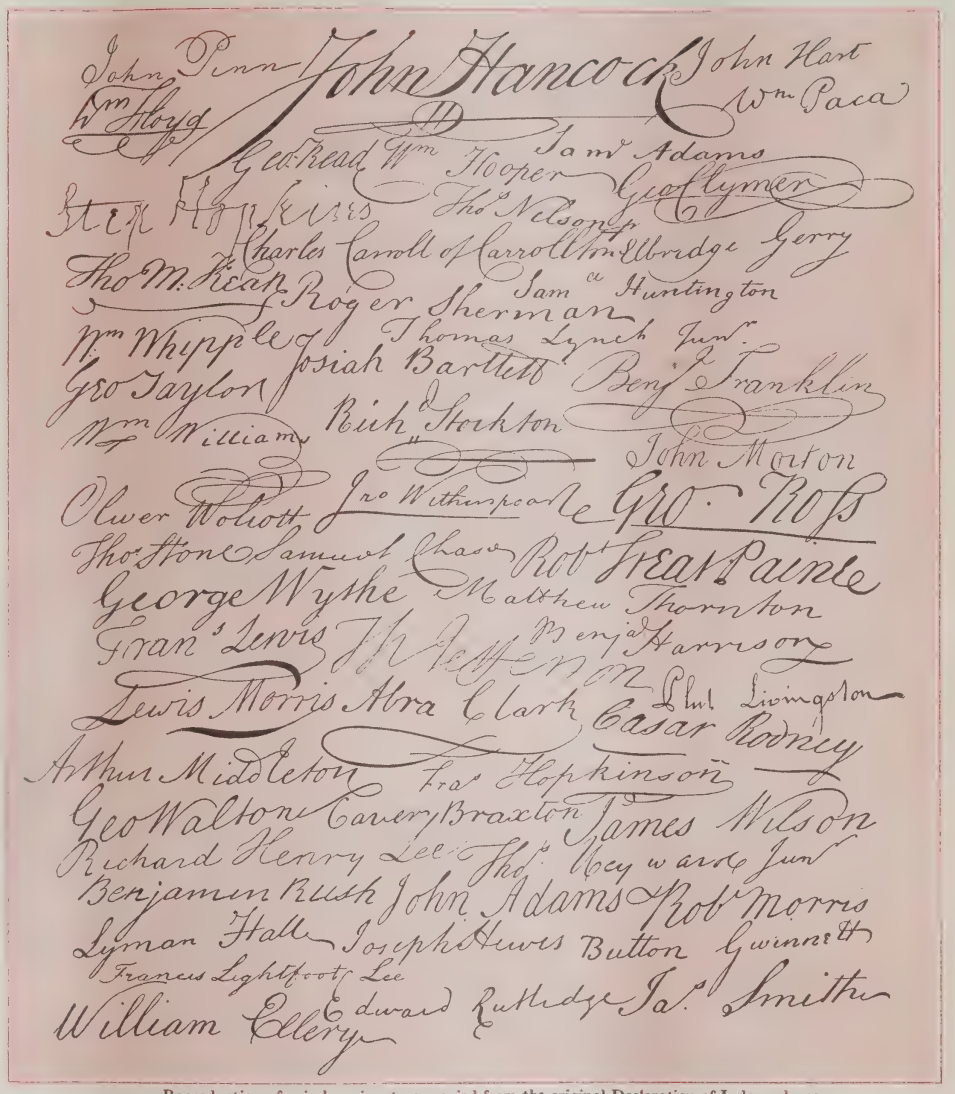
## Big Sums Paid for Autographs of Patriots

By ALICE MacFARLAND

NO HISTORICAL document, not even the Constitution itself, holds so powerful an appeal for the public in general, or for the collector of Americana in particular, as the Declaration of Independence.

It was recognized at a very early date that the signatures of the fifty-six men who affixed their names to that history-making paper 150 years ago would form a valuable collection, and the Reverend Mr. William B. Sprague, of Albany, New York, completed a set of their autographs as early as 1834. A number of others were begun, and when Dr. Lyman C. Draper, of the Wisconsin Historical Society, published his 'Essay on the Autographic Collections of Signers of the Declaration of Independence and the Constitution' in 1889, there were twenty-one complete sets in the United States and one in England. At that time, forty-five sets in the making were traced, some of them complete with the exception of the two rarest autographs of all the Signers, those of Thomas Lynch, Jr., and Button Gwinnett.

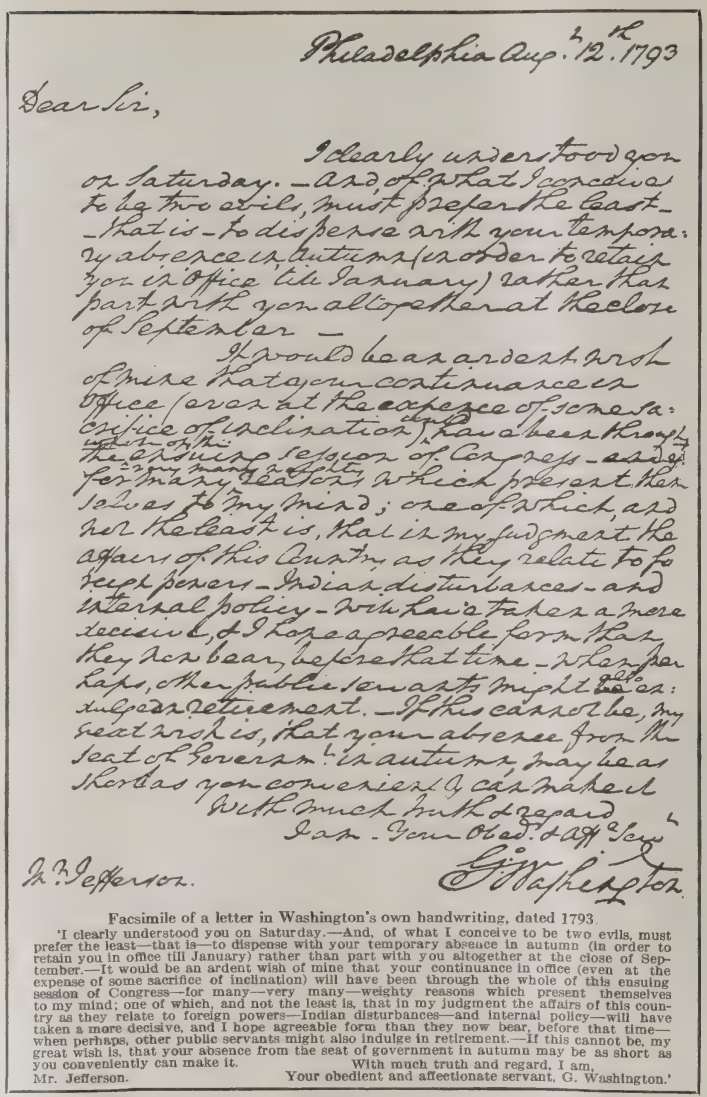
The latest collection of autographs of the Signers to be completed is that of Charles Francis Jenkins, of Philadelphia, who by the purchase of very fine specimens of Lynch and Gwinnett Autographs finished his difficult and delightful task of bringing together a complete set in December, 1924. Mr. Jenkins then performed a service of value to collectors, and to all interested in the Signers, by bringing Dr. Draper's information up to date, and tracing all the complete sets in existence, in an article published in the *Pennsylvania Magazine of History and Biography*, July, 1925.



'What is it,' a casual observer of autograph prices might ask, 'that makes the signature of an historical character so little known as Button Gwinnett bring such a price as $22,500, when the letters of George Washington, though valuable, do not seem to be rare?'

There are more than 1,200 examples of Washingtoniana in the Congressional Library alone; the Morgan Collection comprises many valuable letters; and nearly every collector of Americana manages to own an autograph of the Father of His Country. Most of the Signers lived to a ripe old age, and were indefatigable letter writers, but only one letter of Thomas Lynch, Jr., has been found, and there are only thirty-four known autographs of Button Gwinnett in existence.

Thomas Lynch, Jr., who was born at St. George's Parish, South Carolina, was sent as a delegate to Congress in 1776. Three years later he sailed for St. Eustatius, and it is presumed that he was drowned on the voyage, as he was never heard from afterward. The only known letter in his handwriting is in the Emmet Collection in the New York Public Library. Most of his signatures are cut from documents or flyleaves of books. Mr. Jenkins has two Lynch autographs, both to be found in a volume from the Lynch Library. The J. Pierpont Morgan Library, New York, has four specimens of Lynch autographs, the most interesting being a page of thirteen lines of Latin manuscript headed 'Lynch.' Dr. Emmet, in writing of it in 1890, declared it 'the best Lynch known next to the letter' and predicted that it would bring $500 at any time. How many times $500 it would bring today can only be estimated.



Button Gwinnett, whose autograph is one of the rarest and most valuable in American history, was born in England about 1732, and died from a wound incurred in a duel with General MacIntosh, May 27, 1777. He was representative to Congress from Georgia in 1776-77. Among the most interesting Gwinnett items known is his original will, dated March 15, 1777, written entirely in his handwriting, and signed by three witnesses. It is in the Morgan Collection. The set belonging to Herbert L. Pratt, of New York, boasts a Gwinnett autograph which narrowly escaped oblivion. The janitor of the Telfair Academy of Fine Arts at Savannah was about to destroy a basket of old papers when he was stopped by the custodian who, going over the papers at her leisure, discovered a note made out to Gwinnett which contained his endorsement. It was sold in 1914 for $2,800. Last year, at the Thomas sale, a document bearing Gwinnett's signature, separated by a seal, brought at auction $14,000, or a thousand dollars for each letter in his name. This year, at the Manning sale, the Gwinnett autograph, affixed to a deed, brought the record price of $22,500.

The latest Gwinnett item to turn up is one which contains his earliest known autograph, and which has, in addition, an association interest which enhances its

Reproduction of priceless signatures copied from the original Declaration of Independence.

value. It is Button Gwinnett's Bible. . For ninety years it had been reposing in Mobile, Alabama, among the descendants of Robert Parker, while autograph seekers combed the state of Georgia in vain. How it came into the possession of the Parker family in the first place is a matter which is not quite clear, although several traditions which have come down through the annals of the family seem plausible enough, and are traced by Charles Jenkins in an interesting little brochure on the subject. Its present owner, Francis L. Diard, of Mobile, unearthed it from a tin box among his packing cases a short time ago. The Bible is a worn old calfskin volume in which a separate Old and New Testament have been bound together. Some of the leaves are loose. Some have been nibbled by mice. It is stained by time. It contains three Gwinnett autographs. The first, on the inside of the cover, written in ink, reads: 'The Gwinnett's Bible 1753.' At the top of the title-page of the Old Testament is a signature which some misguided soul, long ago, inked over—thereby destroying the value of the autograph—but on the title-page of the New Testament is a splendid signature dated 1753, which is the earliest known autograph of the Signer. The volume was offered for sale at auction a short time ago, but the inked-over autograph and the general bad condition of the volume created an unfavorable impression, and it did not reach the price the owner thought it should bring, so it is still in the possession of Mr. Diard. Charles Jenkins is publishing a biography of Button Gwinnett within a short time, and includes the early autograph in the Bible among the thirty-four known autographs in his chapter on the subject.

Philadelphia Aug. 12. 1793

Dear Sir,

I clearly understood you on Saturday.—And, of what I conceive to be two evils, must prefer the least—that is—to dispense with your temporary absence in autumn (in order to retain you in office till January) rather than part with you altogether at the close of September.—It would be an ardent wish of mine that your continuance in office (even at the expense of some sacrifice of inclination) will have been through the whole of this ensuing session of Congress—for many—very many—weighty reasons which present themselves to my mind; one of which, and not the least is, that in my judgment the affairs of this country as they relate to foreign powers—Indian disturbances—and internal policy—will have taken a more decisive, and I hope agreeable form than they now bear, before that time—when perhaps, other public servants might also indulge in retirement.—If this cannot be, my great wish is, that your absence from the seat of government in autumn may be as short as you conveniently can make it.

With much truth and regard, I am,

Mr. Jefferson. Your obedient and affectionate servant, G. Washington.

Facsimile of a letter in Washington's own handwriting, dated 1793.

'I clearly understood you on Saturday.—And, of what I conceive to be two evils, must prefer the least—that is—to dispense with your temporary absence in autumn (in order to retain you in office till January) rather than part with you altogether at the close of September.—It would be an ardent wish of mine that your continuance in office (even at the expense of some sacrifice of inclination) will have been through the whole of this ensuing session of Congress—for many—very many—weighty reasons which present themselves to my mind; one of which, and not the least is, that in my judgment the affairs of this country as they relate to foreign powers—Indian disturbances—and internal policy—will have taken a more decisive, and I hope agreeable form than they now bear, before that time—when perhaps, other public servants might also indulge in retirement.—If this cannot be, my great wish is, that your absence from the seat of government in autumn may be as short as you conveniently can make it.

With much truth and regard, I am,

Mr. Jefferson. Your obedient and affectionate servant, G. Washington.'

The Anderson Galleries, as though in answer to unspoken protests against the breaking up of great collections, often print on the back of their catalogs a translated excerpt from the will of Edmund de Goncourt, which gives the other side of the question.

'My wish,' said M. de Goncourt, 'is that my drawings, my prints, my curiosities, my books—in a word, these things of art which have been the joy of my life, shall not be consigned to the cold tomb of a museum and subjected to the stupid glance of the careless passer-by; but I require that they shall all be dispersed under the hammer of the auctioneer, so that the pleasure which the acquiring of each one of them has given me shall be given again in each case to some inheritor of my own tastes.'

While the scarcity and almost prohibitive cost of Lynch and Gwinnett autographs put them out of reach except to the very few, there is no reason why most interesting collections of their fellow Signers should not be formed. The letters themselves, from a historical standpoint, and from the glimpses they give into the lives and characters of the men who wrote them, are of great interest. Take for example the famous letter by Thomas McKean, the Delaware delegate, to Caesar Rodney's

There were twenty-seven complete sets known at the time of Mr. Jenkins' article, whose history and present whereabouts he traced. Many of them are identical with those given by Dr. Draper. It is unavoidable that items so rare and valuable should find their way more and more into libraries and museums, and that private collectors should be somewhat in the minority. There were, when Mr. Jenkins wrote, ten sets in private hands, the remaining seventeen being in libraries, while since then the collections of Colonel James H. Manning and of Dr. George F. C. Williams have been dispersed.

The New York Public Library has four sets, one of which, that collected by Dr. Thomas Addis Emmet, is unquestionably the finest in existence. Of the fifty-six Signers, fifty-four are here represented by autograph letters signed, thirty of which are dated 1776 (a great point with many collectors). The other two are documents. And the letter from Thomas Lynch, Jr., dated July 5, 1777, which we have already spoken of as the only Lynch letter known, is in this collection. John S. Kennedy, of New York, presented the set to the Library in 1896.

Simon Gratz, of Philadelphia, recently made a present of his unequaled collection of autographs to the Historical Society of Pennsylvania, where it is being cataloged. Here the seventy thousand autographs collected by Mr. Gratz during a lifetime of devotion to his hobby are kept in folders inclosed in fireproof cases and are available to the student. Selecting from the enormous number of duplicates the fifty-six most perfect specimens, Mr. Gratz' collection of the Signers equals the Emmet Collection in the New York Library in every particular except for the Lynch autograph, which is the cut signature most frequently met with. The Historical Society of Pennsylvania has a second set, collected by Mr. Emmet, and presented to Mr. Sprague.

The set in the Congressional Library at Washington was given by J. Pierpont Morgan in 1912. When Mr. Morgan learned that there had been up to that time no collection of letters and signatures of the Signers in our National Library, he hastened to repair the omission.

Other libraries and historical societies which have complete sets are: The Maine Historical Society, the Wisconsin Historical Society, Haverford College, the University of Pennsylvania, and the Boston Public Library. The last mentioned set is formed of cut signatures pasted on a copy of the Declaration and framed. The J. Pierpont Morgan Library has two sets. There is one also in the collection of the Rosenbach Company.

Among the private collectors are: Herbert L. Pratt, New York; George A. Ball, Muncie, Indiana; Dr. George C. F. Williams, Hartford, Connecticut; Louis Bamberger, of Newark; Mrs. Thomas Redfield Proctor, Utica, New York; Charles Francis Jenkens, of Philadelphia; William Ely, of Providence; and the Henry E. Huntington Library at San Gabriel, California.

Last year a very fine collection, that of George C. Thomas, of Philadelphia, was dismembered and each item sold separately.

'What a pity,' somesaid, 'to break up and scatter to the four winds a collection which has been gathered together so laboriously, so carefully, so lovingly!'

For Mr. Thomas had been to the end of his life constantly changing and improving his collection, always searching for a letter to replace a document, or for one of more pronounced historical importance or earlier date than the one he had. But the justification came when it was evident just how many collectors were waiting for just those items to complete their sets.

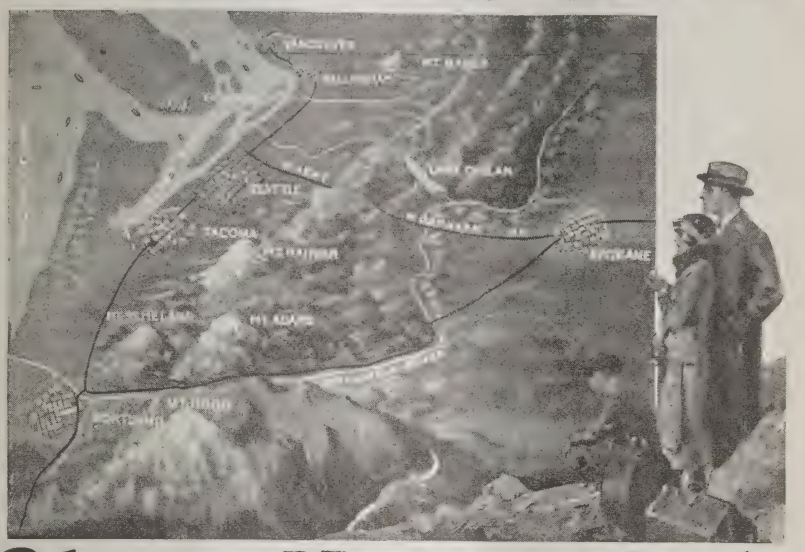
nephew, which presents the facts concerning the Signing of the Declaration in a quite different light from that which has traditionally been accepted. It was sold in the Manning sale in New York, January 19, 1926. Because it corrects certain errors that have crept into our history, and because it will be of interest to many, it is here quoted in part:

*Delaware's Vote for Liberty*

I recollect what passed in Congress in the beginning of July, 1776, respecting Independence; it was not as you have conceived. On Monday, the first of July, the question was taken in the committee of the whole, when the State of Pennsylvania (represented by seven gentlemen then present) voted against it. Delaware, having then only two Representatives present, was divided; all the other states voted for it. Whereupon, without delay, I sent an Express (at my private expense) for your honored uncle, Caesar Rodney, Esquire, the remaining member for Delaware, whom I met at the State House door, in his boots and spurs, as the members were assembling. After a friendly salutation (without a word on the business) we went into the Hall of Congress together, and found we were among the latest; proceedings immediately commenced, and after a few moments the great question was put. When the vote for Delaware was called, your Uncle arose and said: 'As I believe the voice of my constituents and of all sensible and honest men is in favor of Independence, my own judgment concurs with them—I vote for Independence,' or in words to the same effect. The State of Pennsylvania on the 4th of July (there being only five members present, Messrs. Willings, Dickinson and Morris who had in the committee of the whole voted against Independence, were absent) voted for it; three to two, Messrs. Willings and Humphries in the negative. Uniformity in the thirteen states, an all important point on so great an occasion, was thus obtained; the dissension of a single state might have produced very dangerous consequences.

Now that I am on the subject I will tell you some truth, not generally known. In the public printed journal for 1776, Vol. 2, it would appear that the Declaration of Independence was signed on the 4th of July by the members, whose names are there inserted; but the fact is not so, for *No Person* signed it on that day nor for many days after, and among the names subscribed, one was against it, Mr. Read, and seven were not in Congress on that day, namely Messrs. Morris, Rush, Clymer Smith, Taylor and Ross, of Pennsylvania, and Mr. Thornton of New Hampshire; nor were the six gentlemen last named members at that time; the five for P. were appointed delegates by the Convention of that State on the 20th of July, and Mr. Thornton entered Congress for the first time on the 4th of November following, when the names of Henry Wisner, of New York, and Thomas McKean, of Delaware, are not printed as subscribers, though both were present and voted for Independence.

*Courage and Faith*



Here false colors are certainly hung out. There is culpability somewhere. What I can offer as an explanation or apology is; that on the 4th of July 1776 the Declaration of Independence was ordered to be engrossed on parchment and then to be signed; and I have been told that a resolve had passed a few days after and was entered on the secret journal that no person should have a seat in Congress, during that year, until he should have signed the Declaration, in order to prevent traitors or spies from worming themselves amongst us. I was not in Congress after the 4th for some months, having marched with my regiment of associators of this city, as Colonel, to support General Washington until a flying camp of ten thousand men was completed. When the associators were discharged I returned to Philadelphia, took my seat in Congress and then signed the Declaration on parchment.

What a gracious, delightful thing letter writing was in those days! One sees, in spite of wars and rumors of wars, a courtly gentleman seated at his desk, delicate quill in hand and lighted taper nearby, taking sufficient time, no matter what pressing duties surround him, to 'get all his lovely words just right' as one of our contemporary writers would say. The autographs of our time will nearly all be Ls. s. (letters signed) and an A.L.s (autograph letter signed) by anyone will probably in time achieve a certain scarcity, since our great and near great men all hurl dictation at secretaries of keen hearing and much-needed imagination and initiative. A new abbreviation will have to be made to deal with the typewritten letters of the future which, unsigned, are described 'dictated but not read.'

While it is easy to realize and to admit that the times in which we are living are in many ways the most wonderful in the history of the world, with machines to do our bidding, inventions which are changing the world, it is also inspiring to know more of those from whom we inherit our 'background'—those who laid the foundations of the United States of America—and the possession of even a few of their original letters, to decipher ourselves, brings before us, as nothing else can do, the men whose courage and faith gave us our country.

## Casting the Horoscope of the U. S.

(*Concluded from page 14*)

not be included within this geographic formation, but the greater part of the Mediterranean territory will yield to the political power of a dictator who with an iron rod and sword will compel this thing.

As for the United States of America, our greatest setback is indicated by a strong tendency to serious labor troubles and strife between capital and labor and radical socialistic disorders. If wisdom is used and the policy of justice dictates, steps will be taken by our leaders in politics, finance, industry and labor to prevent serious consequences which this kind of trouble will produce for this republic. If trouble is to be avoided, drastic steps must be taken at once to check the subtle propaganda of the un-American element within our borders, and the agents of the Soviet who are busy fermenting trouble among our otherwise peaceful populace. This year and next are years of decisive crisis which will influence largely the future in this momentous period. It is to be hoped those in power will take to heart the serious consequences caused by delay, and that every genuinely patriotic, loyal son and daughter of the nation will rededicate their all to the high ideals of true Americanism.

## New Light on Revolution

(*Concluded from page 7*)

than the Americans. Moreover, the British troops were better trained, better disciplined and more seasoned fighters than the Americans. In addition, the British were better supplied, more adequately armed and better equipped than the Americans. To all this should be added the fact that during the greater part of the war the British controlled the seas. Besides all these facts, the British won most of the battles of the Revolution. In the face of all this, more than one person has marveled that the Americans triumphed. The answer lies partly in the fact that Britain was fighting three other nations as well as America, partly in the incompetency of Lord George Germain, and partly, too, in the fact that the fates were with America.

The effect of the surrender upon the whole course of the Revolution cannot be overestimated. Although at the same time Washington was being defeated in the battles around Philadelphia, still he was keeping Howe so engrossed that aid to Burgoyne was impossible anyway. The news of the surrender of an entire British army and its commander induced the British to try a peace offensive in the next winter—but during that same winter Franklin utilized the news of the victory at Saratoga to overcome the hesitancy of the French and induce them to join in the war on the side of the United States. No wonder, then, Sir Edward Creasy in his well-known work has classed Saratoga as one of the 'Fifteen Decisive Battles of the World.'

*THIRST is to become a national political issue, it seems. In next week's* DEARBORN INDEPENDENT, *it is pointed out how for years this nation tolerated a mixture of politics and booze, but now it has to deal with a mixture of outlawed booze and crooked politics!*

# A Dance A Week

## DICTIONARY OF DANCE TERMS

(*Continued from Last Week's Issue*)

'CAST OFF'—Means to go below the next couple.

'CHASSE ALL'—(8) Face partner, join both hands and chasse in a circle.

'CHASSE ALL'—Another version as used in the Lancers. (Formation, standing beside each other, marching order.) Ladies pass in front of their partners, slide four steps with the left foot, to the left side, take one step forward with the left foot, and one step back with the right (the last two steps are simply for the music). The gentlemen execute the same steps, with the right foot; slide to right side four steps, and step forward on right foot, and back on left. All return to place in same manner, ending with the forward and backward steps.

'COUPLE'—A gentleman and his partner.

'CROSS OVER'—(8) Walk directly across, ladies inside; then each turn in place (the lady will now be on the gentleman's left). Repeat to place.

'CROSS RIGHT HANDS HALF AROUND'—(8) Four ladies or gentlemen, as the prompter may direct, give right hands across, walk half around, halt; turn, give left hands across, retrace half circle and return to place.

'CIRCLE HANDS AROUND'—(8) All join hands and circle left or right.

'CHASSE ACROSS'—(8) Called when the couples in set form straight lines. Ladies take four steps to left, in front of partners; gentlemen to the right, four steps. Then all forward one step, back one step. Return to place in the same manner, lady passing in front.

'CROSS RIGHT HANDS'—(8) Couples forward, join right hands with opposite. All step to left, stop; drop right hands, turn and cross left hands; all four then step to right; then back to place.

'DOS A DOS' (BACK TO BACK)—(4) Lady and gentleman forward, pass to left of each other; that is, right shoulder to right shoulder; having gone one step past each other, take one step to the right, which brings the couple back to back. Without turning, back around each other and walk backward to place.

'DOS A BALINET'—(16) The leading couples join nearest hands with their partners and lead to the right, pass through that couple, and balance. Two couples are now standing back to back. *Gentlemen contra balance.*

From this position, gentlemen of the leading couples join left hands with partners' left, and right hands with the right hand of the other ladies. At the same time the gentlemen on the sides turn, and join left hands with their partners' left, and right hands with the other ladies. Gentlemen are now facing each other, and should balance. The ladies are standing back to back. Both gentlemen drop hands of the other ladies, and turn own partners with the left hand, forming a circle, ladies facing in. (Gentlemen are now facing out.) Then gentlemen drop hands, turn and stand beside own partner. Half right and left to places.

'DOUBLE QUADRILLE'—Requires eight couples; two couples on each side.

'ENDS'—The head and foot sides of set.

'FIRST FOUR'—The four forming the first and opposite couple.

'FIRST TWO'—Head or first lady and the opposite gentleman. Second Two, head gentleman and opposite lady. Third Two, lady to the right of the first couple, and opposite gentleman. Last Two, lady to the left of the first couple and opposite gentleman.

'FORWARD AND BACK'—(4) Start left foot forward, advance three steps. On the fourth count bring right foot raised to the heel of the left. Starting with right foot, walk back three steps and on the fourth count bring left foot up in front.

'FORWARD AND STOP IN CENTER'—Take four steps forward to the center, and wait for the next call.

More terms used in the Old American Dances will be published in next week's issue.

---

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Please order by number.

# Lincoln's Gettysburg Address

(*Continued from page 8*)

tween Washington and Gettysburg; and that he wrote it in full before leaving Washington.

As to the manner of its delivery, I am prepared to prove that he delivered it without any use of manuscript; that he held a manuscript in his left hand and did not refer to it; that he held a manuscript in both hands and followed it somewhat carefully, and finally that he was closely confined to his manuscript and read every word of it.

As to the effect of its delivery, I have equally valid proof that the address was several times interrupted by applause and that there was prolonged applause at the close; that there was applause but that it was perfunctory; that there was no applause because people who heard it were disappointed in it, and that there was no applause because the occasion was so solemn and the address so impressive that applause would have seemed profane.

All this evidence I plan to lay before the reader of this article, and some in addition. The Gettysburg Address is so important in American history and literature that we cannot afford not to know all that is to be known about it.

The Battle of Gettysburg was the only notable battle fought on Northern soil. It occurred on July 1, 2, and 3, 1863. On the following day, July 4, General Grant captured Vicksburg and the army of General Pemberton.

Thus simultaneously in the East and West were won two victories, one of which cut the Confederacy in twain along the Mississippi River, and the other made it certain that the Confederate army could not successfully invade the North. From that anniversary of the birth of American independence, the result was assured, and it would have saved much bloodshed if the fact had been as apparent then as now.

At that time there was no system of cemeteries owned by the Federal Government. Seventeen and one-half acres of land adjoining the village cemetery were purchased on behalf of a corporation organized much like an ordinary cemetery association, the trustees being representatives appointed by the governors, one from each state that had soldiers in the Union Army in the Battle of Gettysburg. The cost was apportioned according to the population of the state in the 1860 census. Thus, Illinois, that had only a few soldiers in the battle, and only a half-dozen graves of soldiers killed, paid a much larger sum than any of the New England states which had many more soldiers buried there but smaller population.

The story, as concisely told in the biographies of Lincoln that followed in the first years after his death, may be taken from the able work of Henry J. Raymond, editor of the New York *Times*, which had been almost the organ of the administration: The account of the dedication is appended to the narrative of the battle:

During the ensuing season, a piece of ground, seventeen and one-half acres in extent, and forming an important part of the battlefield, was purchased by the State of Pennsylvania, to be used as a national burying ground for the loyal soldiers who fell in that great engagement. It was dedicated, with solemn and impressive services, on the 19th of November, 1863, the President and members of his Cabinet being in attendance, and a very large and imposing military display adding grace and dignity to the occasion. Hon. Edward Everett delivered the formal address, and President Lincoln made the following remarks:

Then follows the text of the Gettysburg Address, which need not be printed at this point, as it will be quoted later. That was all that one of the greatest of American editors thought necessary to say about it in 1865.

President Lincoln was not invited to speak when the first invitations were sent out. Edward Everett was invited to deliver the oration, at a date originally set for October. He accepted, but asked for more time, and on his account the date was postponed till November 19. This was perilous, but the weather was fine, and Everett had the time he required for a masterly oration, and he used the time to good advantage.

These and other preliminaries having been arranged, formal invitations were sent to the governors of all the states that had soldiers in the battle, to all the members of both Houses of Congress, to the judges of the Supreme Court, to all foreign ambassadors, to Generals Scott and Meade and others, and of course to the President. General Meade declined, partly because he could not well leave the army and partly because he was smarting under criticism for not having followed Lee's army after the battle. General Scott declined on account of his years.

To the surprise of nearly everyone, the President accepted. His acceptance was almost an embarrassment. Opposition newspapers reported that Lincoln was seeking to intrude his candidacy for re-election into a solemn and sacred occasion. Even worse things were said, as to his conduct on the battlefield of Antietam, while soldiers were being buried. There is no reason to suppose that any of the governors or commissioners shared these criticisms, but they were confronted by the unexpected.

Colonel Clark E. Carr, the Illinois representative on the commission, suggested that as the President was to be present, he ought to be asked to speak. The suggestion did not meet with universal favor. Lincoln had never delivered a Gettysburg address, and no one knew just what he would say on such an occasion. Very tardily, about three weeks before the dedication, he was asked to follow 'the address' by Mr. Everett with a few appropriate dedicatory remarks.

The President went to Gettysburg on the preceding day, thus overruling the first arrangements, which were that he should have left Washington in the morning and returned at night. He accepted the invitation of Judge David Wills, the local representative of Governor Andrew Curtin, of Pennsylvania, to spend the night at his house. That night Lincoln was serenaded, and declined to speak; but Seward responded when the band played under his window. Lincoln was painfully aware that he had little to say, and could not afford to waste it.

Never, except during the battle, had Gettysburg been so full. The special train of four coaches which brought the President contained as passengers his two secretaries, John G. Nicolay and John Hay, members of the Cabinet, foreign ministers, officers of the Army and Navy, and others. Longer and more crowded trains from all nearby cities brought a vast multitude of spectators. In the morning there was a procession, but it was not very effective. The people preferred to stand on the curb and see the procession go by rather than be a part of it. The President rode on horseback about three-quarters of a mile from Judge Will's house to the cemetery. He was a very tall man and was furnished an undersized horse.

The exercises were to have begun at eleven o'clock, but the procession was a half-hour late, and Mr. Everett was another half-hour behind. So the ceremonies did not begin until noon. There was music and prayer, and Mr. Everett spoke within three minutes of two hours. Then Abraham Lincoln rose and made his few remarks.

With this rapid outline, we are ready for the testimony of those who heard the address and can tell us about it. First, when did Abraham Lincoln make his preparation?

Ex-Senator Cornelius E. Cole, of California, who was present, returned to his old college, Wesleyan, in June, 1923, and related the true story of the Gettysburg Address as he believed himself to know it. He said that Lincoln made no preparation whatever. Professor John W. Draper, in his excellent *History of the American Civil War*, says that the President rose and said, 'unpremeditatively and solemnly,' 'It is intimated to me that this assemblage expects me to say something on this occasion.'

Honorable Horatio King, in his book, *Turning on the Light*, declares that he saw Lincoln write the address on a long, yellow envelope, as he sat in the home of Judge Wills.

Judge Wills affirmed that Lincoln wrote the entire address in his house on the night before its delivery, and that he accompanied Lincoln when he walked to a nearby house late that night to read it to Honorable W. H. Seward, from whom he received valuable corrections, and then returned to the Wills house and copied on a paper which Judge Wills saw him use, and that from that same paper he read it next day. Honorable Edward McPherson, clerk of the House of Representatives, who lived in Gettysburg, said that after Lincoln retired to his room for the night, he inquired concerning the order of the next day's program, and 'began to put in writing what he called some stray thoughts to utter on the morrow.'

Governor Curtin, according to reliable testimony, declared that on the night preceding the dedication, the President remarked that 'he understood the committee

expected him to say something' and that if those present would excuse him, he would withdraw and make his preparation, and that he did withdraw, but returned and read from the back of a large envelope what he had hastily written, and after some suggestions from those present in the Wills parlor, went back and copied his address.

Ben Perley Poore, in his *Reminiscences of Lincoln,* declared that the address was 'written in the car on his way from Washington to the battlefield, upon a piece of pasteboard, held upon his knee.' The yellow envelope familiar in the Wills house story was seen by certain witnesses on the train. Mrs. Mary Shipman Andrews, in her *The Perfect Tribute,* relates that Lincoln looking across the car at Seward (who, by the way, was not on that train at all) became nervous about his own lack of preparation, and seeing Secretary Seward unwrapping some books, asked for the brown wrapping paper, saying, 'May I have this for a little writing?' Then with a stump of a pencil he labored diligently for hours as the train made its way to Gettysburg.

### *A Group of Opinions*

Senator Cameron, of Pennsylvania, declared that Lincoln wrote it in full before he left Washington, and that Cameron saw it there. Noah Brooks said that he went with Lincoln to a photograph gallery a day or two before he left for Gettysburg, and that Lincoln took with him and read between the sittings, Everett's address, and said his own was blocked out but not complete, and that it would be short.

Judge James Speed, of Lincoln's Cabinet, said that Lincoln told him he found time to write about half of it before he left Washington. General James B. Fry, who was on the train with Lincoln, declared that he did not see Lincoln doing any writing, and that the interruptions were so many it would have been just about impossible. We have other opinions to the effect that Lincoln wrote the whole address after his return to Washington. Honorable Isaac N. Arnold, who knew Lincoln well, but who obtained his information from Governor Dennison, of Ohio, said that while Lincoln was on his way to Gettysburg he receive his first official intimation that he was expected to speak, and, retiring to a seat by himself, with a pencil he wrote the address.

How did Lincoln deliver the address?

Senator Cole declares that he held no paper in his hands, and he is squarely contradicted by innumerable witnesses who saw him with manuscript in hand, but these witnesses differ as to whether he merely held it or read from it, and whether he held it in one hand or both hands. I have excellent proof for any opinion the reader may prefer.

As to the applause, the Associated Press report inserts the word 'applause' and at the close 'prolonged applause,' but the reporter admitted that he put this in afterward and was not quite sure how often it belonged there. Colonel Clark E. Carr wrote, 'His expressions were so plain and homely, without any attempt at rhetorical periods, and his statements were so axiomatic, and I may say matter-of-fact, and so simple, that I had no idea that as an address it was anything more than ordinary.'

He added that he did not observe any applause during the address and that at the close it was not loud nor long. Mrs. Andrews' little story tells how it was received without applause and the President thought it was not appreciated, but a dying Confederate soldier taught him better, or at least gave him a more comforting interpretation of what Lincoln regarded as a failure.

My own belief is that the President wrote the greater part of the address before leaving Washington, wrote it on a sheet of Executive Mansion stationery, and used ink; that he probably had some additional words on a second sheet which he either lost or discarded, completing in pencil on a second sheet of paper of another sort his first draft. He may have looked it over, and made a few notes on an envelope while on the train, but he did not do much serious work there. He probably wrote his second sheet in pencil in Gettysburg on the night he was there, and he certainly was seen by John G. Nicolay copying the entire document on the next morning, using paper without heading, but just such as he was accustomed to use in the White House, and had doubtless brought with him, being the kind of paper he used for the Second Inaugural and other important papers.

### *Comparison of Various Copies*

These two copies are in the Library of Congress, and I think it was the second of these that he held during the delivery, but that he did not read it closely, though he held it in both hands. Delivering it in this way, he made a few verbal changes from the form he had intended to use, the most notable of these being the insertion of the words 'under God.' These words are not in either of the first two forms, but they are in all the telegraphic forms, even those most inaccurate, and could hardly have been there if Lincoln had not used them; and Lincoln retained those words in each of the three revisions.

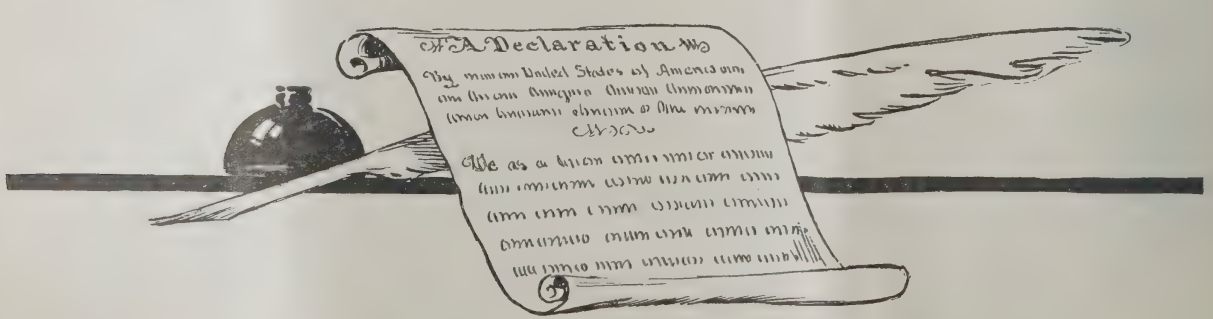
I have nine different forms of the address, and five are photostats in Lincoln's own handwriting. Two of these were made before delivery and three afterward. They differ slightly and the changes are interesting, but most of them unimportant. Apparently Lincoln did not say 'our *poor* power' though he had intended to do so, and inserted the word 'poor' in all his revisions, but left it unspoken inadvertently.

Out of these several forms, we may give brief attention to four. We need not include the Associated Press report, for that, by the testimony of Mr. Gilvert, reporter, was only partly a shorthand report, and was checked up later with the manuscript. But we may begin with the report made by Charles Hale, of the Massachusetts commissioners, who was a competent reporter, and who affirmed that he took down the precise words that Lincoln spoke, and these were included in the report of the commission to Governor John A. Andrew. Then we may notice two widely variant newspaper reports, one in the Cincinnati *Gazette,* and the other in the Philadelphia *Inquirer.* The latter is of some interest because it was the form copied in the Gettysburg paper. Finally we may take President Lincoln's own fifth and final writing of it, carefully made for the Soldiers' and Sailors' Fair in Baltimore, and reproduced in facsimile in a volume sold there containing many other notable autographs. This has come to be known as 'the standard form' because it represents President Lincoln's thoughtful and deliberate judgment as the form of the address which he would like to be known.

Verbatim report by Charles Hale, of the commissioners representing Massachusetts at the dedication of the National Cemetery—

Four score and seven years ago, our fathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation—or any nation, so conceived and so dedicated—can long endure.



We are met on a great battle-field of that war. We are met to dedicate a portion of it as the final resting-place of those who have given their lives that that nation might live.

It is altogether fitting and proper that we should do this.

But, in a larger sense, we cannot dedicate, we cannot consecrate, we cannot hallow, this ground. The brave men, living and dead, who struggled here, have consecrated it, far above our power to add or to detract.

The world will very little note nor long remember what we say here; but it can never forget what they did here.

It is for us, the living, rather, to be dedicated, here, to the unfinished work that they have thus far so nobly carried on. It is rather for us to be here dedicated to the great task remaining before us; that from these honored dead we take increased devotion to that cause for which they here gave the last full measure of devotion; that we here highly resolved that these dead shall not have died in vain; that the nation shall, under God, have a new birth of freedom, and that government of the people, by the people, for the people, shall not perish from the earth.

Report in the Philadelphia *Inquirer*, November 20, 1863—

Four score and seven years ago our fathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing the question whether this nation or any nation so conceived, so dedicated, can long endure. We are met on the great battlefield of that war. We are met to dedicate it, on a portion of the field set apart as the final resting place of those who gave their lives for the nation's life; but the nation must live, and it is altogether fitting and proper that we should do this.

In a larger sense we cannot dedicate, we cannot consecrate, we cannot hallow this ground in reality. The number of men, living and dead, who struggled here have consecrated it far above our poor attempts to add to its consecration. The world will little know and nothing remember of what we see here, but we cannot forget what these brave men did here.

We owe this offering to our dead. We imbibe increased devotion to that cause for which they here gave the last full measure of devotion; we here might resolve that they shall not have died in vain; that the nation shall, under God, have a new birth of freedom, and that the Government of the people, by the people, and for all people, shall not perish from earth.

The same report was in *The Compiler* (Gettysburg), November 23, 1863.

Report in the Cincinnati *Daily Gazette*, November 21, 1863—

Four score and seven years ago our fathers established upon this Continent a Government subscribed in liberty and dedicated to the fundamental principle that all mankind are created free and equal by a good God. And now we are engaged in a great contest deciding the question whether this nation or any nation so conserved, so dedicated, can long remain. We are met on a great battle-field of the war. We are met here to dedicate a portion of that field as the final resting place of those who have given their lives that it might live. It is altogether fitting and proper that we should do this.

But in a large sense we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, the living and the dead, who struggled here, have consecrated it far above our power to add to or detract from the work. Let us long remember what we say here, but not forget what they did here.

It is for us, the living, to be dedicated here to the unfinished work that they have thus far so nobly carried forward. It is for us here to be dedicated to the great task remaining before us, for us to renew our devotion to that cause for which they gave the full measure of their devotion. Here let us resolve that what they have done shall not have been done in vain; that the nation shall, under God, have a new birth offered; that the Government of the people, founded by the people, shall not perish.

The typographical errors are as in original reports.

Lincoln's Final Revision, published in Autograph Leaves of Our Country's Authors' pp. 102-3—

Four score and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We have come to dedicate a portion of that field, as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

But, in a larger sense, we cannot dedicate—we cannot consecrate—we cannot hallow—this ground. The brave men, living and dead, who struggled here, have consecrated it, far above our poor power to add or detract. The world will little note, nor long remember what we say here, but it can never forget what they did here. It is for us the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.

ABRAHAM LINCOLN.

November 19, 1863.

Most of the men who remember the address think they remember to have felt at the time that it was a great address, but I think that was not the prevailing impression at the time. This is the way I think the address was received.

The audience was weary when Lincoln began. Most of them had been there three full hours. Many of them had stråyed a little distance away. When he rose, there was a shifting of position and a moving nearer, so that the opening sentences were lost on some of those farther away. Then there was a sense of incongruity, the very tall man with a thin, high voice did not instantly register the correct impression on the people. But the voice carried well, and though it was not the rich baritone of Everett, and wholly lacked his graceful gestures and noble bearing, it was heard. Then the people noticed some little oddities of pronunciation, emphasized by Lincoln's effort to speak very plainly. Then they accepted the remarks as a mere recital of what everyone knew, told in the simplest and most commonplace form. And just as they got these impressions fairly well in hand and began to listen, he stopped. He stopped before he seemed to have fairly begun.

I think there was a little perfunctory applause, more for the man than the speech. I am not impressed by the fact that Everett said to the President that he wished his own two-hour address were as likely to live as Lincoln's two-minute speech. Everett knew how to make a graceful compliment. I accept Ward Hill Lamon's statement that Lincoln declared to him that the address 'did not scour.' I think Lincoln felt that he had not made a great speech. I doubt if many others did. Nicolay says, and I think truly:

There is every probability that the assemblage regarded Mr. Everett as the mouthpiece, the organ of expression, of the thought and feeling of the hour, and took it for granted that Mr. Lincoln was there as a mere official figurehead, the culminating decoration, so to speak, of the elaborately planned pageant of the day. They were therefore totally unprepared for what they heard, and could not immediately realize that his words, and not those of the carefully selected orator, were to carry the concentrated thought of the occasion like a trumpet peal to farthest posterity.

Neither Lincoln nor those who heard him suspected how great an utterance they heard that day. Perhaps Lincoln never knew. Yet before he died there was some approach to an appreciation of the merit of what he had said. I can discover no ground for the statement that the English newspapers first pointed out the extraordinary merit of this little speech. There as in our own country the recognition was not immediate. Some newspapers in this country spoke with bitter sarcasm of 'the president's silly remarks,' among them the leading newspaper of Harrisburg, the capital city of Pennsylvania; and the *Register*, in Lincoln's own city of Springfield, was hardly less sarcastic. But a few editors, notably J. G. Holland, of the Springfield *Republican*, immediately declared that the President had delivered a really great address. Everybody thinks so now, but it took the world some time to waken to the fact.

# Liberty Enlightening the World

By FRANK DORRANCE HOPLEY

THE first object to be seen by the traveler returning to his native land, or the alien seeking the New World, as the ship nears the harbor of New York, is the dim, towering outline of Bartholdi's famous statue, 'Liberty Enlightening the World.'

As the ship approaches, the hazy, ghostlike form slowly resolves itself into a clean-cut figure of a woman, with right arm held aloft, bearing a torch. If it be after sundown the light in the torch gleams brightly, and its rays can be seen for miles, a glittering path upon the water.

It was more than a half-century ago that the people of France conceived the idea of presenting to their sister republic across the Atlantic this statue as a token of respect and affection.

It had long been the wish of the French people to make some demonstration of their regard for the United States of America, and many projects had been advanced. A monument of prodigious size, to stand at the gateway of the New World, was urged. At last a committee was formed, and on November 6, 1875, a banquet was held at the Hotel of the Louvre at which the project was formally launched. It was a memorable gathering. Speeches of great fervor were made. The proposed gift was designed to celebrate the hundredth anniversary of American independence.

At the conclusion of the dinner an appeal to the French people for funds was drafted. The appeal touched the hearts of the French people, and money began to come in from all parts of France. Some contributions were large, but the plan was that the fund should be made up through the offerings of the many. A large proportion of the amount was subscribed in small sums; the workmen, the peasants, and the children all contributing. It was in reality, what it was designed to be, a gift from the whole people of France.

Because of the large amount of money needed, several years passed before the entire sum was obtained. At last, however, the funds were in the hands of the committee.

M. Auguste Bartholdi, a noted French sculptor, was given the commission to construct the greatest statue ever attempted. The first big problem was to select the material for the statue. Carved stone or cast bronze could not be handled safely in such size. It was finally decided to make the statue of *repousse* or hammered copper, which was excellent from an artistic point of view.

An immense shop was built in France especially for the construction of the statue. In it were four plane surfaces, on which the work was carried out.

A model was made, one-sixteenth the size of the proposed statue. After the proportions were worked out to the smallest detail, it was enlarged to one-fourth the size. Then came the full-size model. This had to be made in sections so it could be more easily handled. The quarter-size model was divided into sections, and each one laid off in squares and pointed. Some portions, particularly the drapery, required as many as 300 of these points, with 1,200 extra marks.

Wooden frames were made covered with lath work on which plaster was placed, thick enough to mold into all the inequalities of the model. Measurements taken from a section of the model were increased four times, and carefully molded into shape. Then the carpenters were called in; they fitted frames of wood upon the outside of each section. Sheets of copper, 3/16 of an inch in thickness, were beaten on the inside of these frames with wooden mallets. This produced in bronze copper a facsimile of each section. An iron frame or girder was made for the inside of the statue, upon which the copper sheets were riveted.

The proportions of the statue are amazing. The exact height is 111 feet, and with the pedestal, 151 feet 1 inch. The forefinger measures 8 feet in length, and 5 feet in circumference at the second joint. The finger nail measures 14 inches in length and 10 inches in breadth. The head is 14 feet high. The eye, 28 inches in width. The nose 3 feet 9 inches long. The total weight of the figure is 440,000 pounds, of which 176,000 pounds are in copper, the remainder being wrought iron. Eight persons may stand in the torch, and forty within the head at one time. The torch is equipped with a very powerful electric light, and is 305 feet 11 inches above mean tide.

The site selected by the United States Government for the Liberty statue was Bedloe's Island, in the New York Harbor and a pedestal in keeping with the magnitude of the figure was erected. The cost of the pedestal and foundation was raised through popular subscription by the American people.

Every side of the foundation and of the pedestal is alike. The wall of this vast foundation work is broken only by wide passageways through it, at the level of the ground and a circular vertical shaft in the middle, up which run the stairways and an elevator. At an elevation of 72 feet 8 inches, the walls of the pedestal recede leaving on every side, between them and two large columns and two pilasters, a balcony onto which doors open from the inside.

On Friday, July 4, 1884, came the formal presentation of the Statue of Liberty to the United States. On that occasion M. Ferdinand de Lesseps, president of the American Union, acted for France, and Levi P. Morton, then American Minister, for the United States.

The statue was shipped in sections to America, raised, piece by piece, and the sections put together in their proper places upon the pedestal. It was nearly two years from the day of the presentation, before the statue was dedicated. There it has stood for more than a third of a century, beaten and whipped by the storm, scorched by the burning sun, covered with ice and snow until it seemed like a phantom rising out of the sea. But its message has always been the same; that of liberty, equality and justice.

# BRIEFLY TOLD

MAJOR POGSON, OFFICIAL water-diviner at Bombay, India, sank fifty-three wells on sites in the districts of Ahmadnagar, Sholapur and Bijapur where a shortage of water is most severe. In forty-seven cases water was struck; in four the depth at which it was predicted water would be found has not yet been reached; and in two cases, though the depth required has been reached no water has been found.

AMONG THE JAILS OF long ago was one at Swanage, England, where an inscription over the door read as follows: 'Erected for the Prevention of Wickedness and Vice by the Friends of Religion and Good Order.'

IN CHINA, A TOTAL abstainer, observing the social amenities, delegates his drinking to a servant. When one servant is intoxicated, he is replaced by a sober one.

THE AMERICAN LEGION Convention in Paris in 1927, it is estimated, will cost $15,000,000.

THE RICHEST SILVER mines in the world are at Quanajuato, twelve miles by rail from Mexico City.

IMMIGRANTS TO THE United States between 1898 and 1925 included 3,828,282 Italians, 1,370,829 Germans, 1,118,239 English, 851,423 Irish and 438,484 French.

TWICE A YEAR gold bullion lying in the Federal Reserve Bank of New York is dusted and cleaned.

DIAMONDS IMPORTED INTO this country during one month amounted to more than $6,000,000.

'HIRING FAIRS' ARE STILL held in the large country towns of England. All farm laborers and boys gather in the streets of the nearest towns and wait for someone to employ them for the next six months. After the question of wages is settled and a shilling given as guaranty, everyone joins in merry-making.

NINETY-FIVE PER CENT of Iowa's total area is devoted to agriculture; 33 per cent of Georgia's is so used, 30 per cent of South Carolina, 28 per cent of Tennessee, 25 per cent of Alabama, 23 per cent of Virginia, 22 per cent of Mississippi, 21 per cent of North Carolina, 20 per cent of Arkansas, and 15 per cent of Texas.

PRESIDENT MONROE WAS wont to go to market and personally do the purchasing for the White House during his tenure as Chief Executive.

WORDS AND PICTURES describing the first great naval battle in history have been unearthed in Egypt. The battle was between the then uncivilized Greeks and the cultured Egyptians. The Greeks were victorious.

IT IS ESTIMATED THAT two-fifths of Russia's area is covered with forests.

A GEORGIA court of appeals has ruled that husbands driving automobiles do not have to take orders from their wives.

A WIDESPREAD BELIEF that sunspots lessen the heat of the sun during the period of their existence cannot be confirmed, according to meteorologists.

TIDES FROM THE GULF of Mexico affect the waters of the Bayou Mezpique, in Louisiana, more than one hundred miles upstream. The bayou is ninety feet deep at a point seventy miles from its mouth, while the elevation of its banks at that point is only nineteen feet.

THE OLD EXPRESSION, 'robbing Peter to pay Paul,' is believed to date from 1560 when lands belonging to the Cathedral of St. Peter at Westminster were appropriated to repair St. Paul's Cathedral.

MEXICO HAS SUPPLIED one-fourth of the world's oil for several years.

IN ANCIENT DAYS A person managing to erect a dwelling in one night on common land in Wales was held to be its owner and nobody could disturb his tenure. These abodes were generally raised of peat or turf, and known in Welsh as 'Tai Um-nos' (one-night's house).

A PAPER SAID TO BE more durable than iron has been perfected by engineers of an electrical company.

AMERICAN CAPITAL INVESTED abroad in 1900 was $500,000,000; at the end of 1925, exclusive of Government loans, it totaled $10,405,000,000.

ONE OF THE LARGEST frog farms in the world has been started in Texas. A large lake was drained and fish, enemies of frogs, eliminated. The frogs will supply mid-western and eastern markets.

GOLF COURSES FOR WOMEN only are common in England and Scotland. Feminist desire for complete independence is the cause for the separatist movement.

EVERY SIXTY-FIRST year in Japan is regarded as extremely unlucky, and it is believed that each girl born in that year will either deceive her husband or fail to find one. Last year 300 victims of this superstition committed suicide.

SNAKES LIKE CLASSICAL music but object to jazz, according to the curator of a South African zoo. Cobras glared stonily during the playing of jazz but wriggled and danced when the overture from *Faust* was played.

TEN THOUSAND SEALED bottles will be turned loose in New York Harbor as part of a plan for study of current and tidal changes in the ocean.

CALLS RECEIVED BY THE Chicago Fire Department during one month included requests to rescue cats from trees, requests from persons who had lost keys to their homes and wanted ladders to get in through windows, from one woman annoyed by dust who demanded that the department sprinkle the street and from another who wanted the fireman to paint her flagstaff.

A DARING CALIFORNIA steeplejack who calls himself 'the human squirrel' recently declined a request to remove two swarms of bees from the cornice of the Tulare County courthouse.

SALES OF LIFE INSURANCE policies increased 12.2 per cent the first four months of this year over the corresponding period in 1925

PERUVIANS CARRY SOIL for hundreds of miles in baskets and on pack horses to make productive the terraces they build along the mountain sides. These farms, many of them hundreds of years old, show no signs of soil depletion.

BALSA, A WOOD FOUND in Ecuador, South America, is the lightest in the world. As it weighs only 7.5 pounds a cubic foot, a man may easily carry a large load of it on his shoulders.

THERE IS AN AUTOMOBILE for every 5.8 persons in the United States, and for every 45 persons in England.

FOX HUNTERS IN Rhode Island must now bring in the tongue of each fox killed to claim the five dollar bounty. In the past an ear was sufficient, but as foxes have two ears double bounty was often paid foxy hunters.

SOME FORTY LANGUAGES are spoken in Jerusalem. It is not unusual to find a man who speaks half a dozen languages, and many uneducated persons can converse with ease in two or three tongues.

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

IN every flower some bee hums over his laborious chemistry and loads his body with the fruits of his toil, in the slant sunbeam, populous nations of motes quiver with animated joy, and catch, as in play, at the golden particles of the light in their tiny fingers. Work and play, in short, are the universal ordinance of God for the living race, in which they symbolize the fortune and interpret the errand of man. No creature lives that must not work and may not play.

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

THE FORTY-TWO DOLLAR per capita circulation of money in America includes such moneys as are lying in the vaults of banks, hoarded, and in reserves. The money actually in circulation daily serving the people as a circulating medium is probably less than ten dollars per capita.

A NAVAL RESERVE consisting of 675 acres of public land in Louisiana, set aside in 1820 for the live oak timber upon it to be used for wooden naval vessels, has been restored to the public domain. Preference in entry is being given to war veterans.

WEAVING WAS PRACTISED in China more than a thousand years before it was known in Europe. Many fine specimens of the art are still in existence.

IN THE SOUTH SEAS there is a little fish about six inches long that leaves the water to hunt insects and worms on the beach.

THE PURCHASE OF A collection of manuscripts, maps and documents which once belonged to Christopher Columbus has been sanctioned by a royal decree of the Spanish Government. They were in the possession of the Duke of Veragua, a direct descendant of Columbus.

A CORKED BOTTLE THROWN into the Atlantic Ocean off the coast of Florida was picked up on the beach at Ireland, 4,000 miles away, ten months later.

A RESIDENT OF DEATH VALLEY, California, as an experiment, put a setting of white leghorn eggs in a box in his cellar last summer. He avers that six chicks were hatched

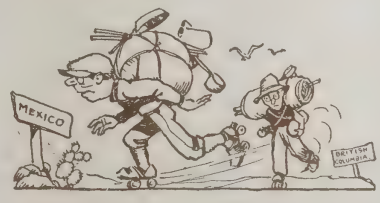
A CINCINNATI man has sued the local street car company for $5,000, alleging he was bitten by a spider while riding on one of the trolleys.

TOKYO EXPERIENCED AN average of fourteen earthquakes a day during 1925. The majority of them were minor disturbances.

BLACKBURN COLLEGE OF Carlinville, Illinois, has an endowment fund enabling it to offer to prepare young men for the Presbyterian ministry at a charge of $100 a year for board, room and tuition.

THE 150TH ANNIVERSARY of the birth of the United States Navy was celebrated at Marbiehead, Massachusetts, June 17-19, 1926.

TUBERCULOSIS PROVED FATAL TO fifty per cent more men than women in New York from 1920 to 1925.



GOLD IS BEING MINED in a marshy field near Cairo, Wales, on a site worked nearly 1,700 years ago by the Romans.

THE WHEELBARROW WAS used by the Chinese thousands of years ago.

ON THE CELEBRATION of Argentina's Independence Day the prisons at Tuconan were opened and every man given his liberty for the day. When the festivities were over, the prisoners filed back into jail.

A GERMAN SCIENTIST HAS devised a method which he claims will cure leprosy. It consists of 'freezing' the diseased tissues with carbolic acid 'snow.'

OFFICIAL FIGURES OF THE United States Government show that 119,568 men and women in the armed forces of the nation lost their lives as a result of the World War. These included 36,815 killed in action; 13,536 who died of wounds; and 68,941 who died of diseases and other causes.

ROLLER SKATES ARE coming into favor as a means of conveyance in the West. It is possible to roller skate from Vancouver, British Columbia, to Tia Juana, Mexico, except for short detours, and scores of skaters carrying shoulder packs are using this method of locomotion. They can travel many miles a day.

WHEN THE TIRE OF AN automobile blew out as it was passing a pasture in Iowa, six mules stampeded, broke through the fence, and kicked the automobile full of holes.

A COURSE OF COOKING is being offered to boys in a Michigan high school, special emphasis being laid on camp cookery.

THERE ARE MORE telephones in New York City than in London, Paris, Berlin, Brussels, Vienna and Rome combined.

WHEN MARCO POLO LAY dying he was urged to retract the story of his travels in Cathay. He refused, saying, 'I have not told the half of what I saw.'

ELECTRIC MOTORS IN the United States are doing work equivalent to that of 170,000,000 men.

IT COSTS THE UNITED States Treasury $5,000,000 a year to replace worn-out paper currency. Twelve hundred tons of worn and damaged paper money returns to the Treasury each year.

JAMAICA PRODUCES ABOUT one-third of the world's banana supply.

AFTER CENTURIES, DURING which only the pen was permitted to be used in French courts of justice, the typewriter has at last been authorized for the printing of court documents.

SIBERIAN sled dogs, reputed among the best in the world, howl like wolves instead of barking.

EARLY VICTORIAN STYLES again predominate in the latest London fashions. Side whiskers are becoming popular and fashion experts predict the return of the short-tailed coat and nearly brimless top hat of the balmy Victorian era.

IT IS DIFFICULT properly to fingerprint bricklayers because the ridges of their fingers are worn off in their work.

A LONDON WOMAN HAS sued a beauty parlor for damages, charging that she was left immersed in a mud bath all day by an attendant who forgot her.

JESUITS TRAVELING westward through Canada as early as 1660 found the Indians burning coal instead of wood.

A NEW WORLD'S RECORD for fasting was recently set by a European, who went sixty days without food.

THE NEW UNIFORM OF the Marines will be of a dark shade of khaki with a grayish tinge. Roll collars will be worn by both officers and men.

THE FESTIVAL OF ST. JOHN, thought to be derived from the Druidic Sunfeast, is still celebrated in Brittany. Bale fires blaze on every hillside. The peasants, in holiday attire, dance around them all night to the music of the oboe and the shepherd's horn. It is believed that the girl who dances around nine fires before midnight is destined to be married within the year.

THE INDIAN method of shaving was to burn off the hair by means of a greased stick, lighted in a fire.

MUTTON STEW, LAMB CHOPS and roast mutton have been crossed off the menu of the British Army as a medium of economy. Roast and boiled beef and sausages are being offered as substitutes.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the economic value of accuracy in industry.

Never, never, never will we rehash stale prohibition stuff. It is the hope of its opponents that prohibition publicity will become as wearisome as shipping board publicity used to be. And it may easily become so. When, therefore, we publish this article, you may know that it has a fresh angle. The worst mixture being sold in the country now is cheap politics and bad booze—they always did go together. (p. 3)

This number of THE DEARBORN INDEPENDENT contains such a variety of elements that it is not easy to describe it in a word. Suppose you are interested in authorship—and who is not? You want to ask writers how they do it, how books are made and sold to publishers, how extensive is the American writing industry anyway?

Donald Hough looks round the part of the world where he lives and concludes that almost everyone is writing a book. Of course, he lives in a very industrious literary community. But what he says is more or less true everywhere in America. (p. 5)

Better than that, we give the autobiography of a best seller by the man who wrote it. Modesty prevented him from disclosing the name under which it was published; he uses the name he first selected for it. But we are under no such inhibition, and straightway announce that the book is *Fran*. This true narrative of the labors, sighs, suspense, hopes, joys and fruition through which that best seller passed, is worth a lot to readers and writers alike. (p. 12)

And still we mount the literary scale—for next comes Galsworthy. Teignmouth Shore made a pilgrimage for us to tea and talk with the great novelist and playwright. And they did talk! Galsworthy was most communicative. (p. 2)

Still, the magazine this week is not all literary. There's that prohibition article we mentioned first thing. Then along comes Huston Thompson, chairman of the Federal Trade Commission. This week he tells about price-fixing associations, how they work. Every one of these associations reach as far as your pocket. (p. 6)

A minister went to church, and he didn't like it. This is rather important, since the minister is the Rev. Dr. William E. Barton, father of famous sons, world-renowned Lincoln biographer, minister at Oak Park, Illinois, for more than a quarter-century, author of scores of books, lecturer at the universities, world traveler, Christian-minded gentleman. On a free Sunday he went to church. He came away with that sense of something wanting, which has troubled so many a Sunday morning for the rest of us. And he wrote out of his heart. (p. 14)

A dear Quaker letter with a Mss.: 'Will thee please publish —— If thee does not use it please return it so I can send it elsewhere; but I very much hope thee will use it and that I shall hear from thee soon. With best wishes, I am, thine truly, ———.'

Ivan Swift does so many things, it is impossible to show him in action all at once. He paints, lectures, writes poetry, utopiaizes, plays music, is an amazing conversationalist, impersonator of moods and voices, mystic, critic. This time he writes of a theme that is always very warm to his touch—Michigan and its French habitants. We first heard of Pere Gilbault (geel-bo) in conversation. Didn't think it could be reduced to print, but here it is, almost the tones of the voice, and all the overtones of the pioneer spirit. (p. 8)

From the *coureurs des bois* of Michigan to the voyage of Magellan is a distance in time and geography, but they belong to the same world of adventure. Followers of Mr. Finger's narrative (if not you, get out your back copies at once) have seen history written in the color of truth. And nothing adventurous lost because of truth. Big business was behind all that exploration. Magellan's story has been fictionized out of shape. Mr. Finger knows all the region where Magellan is supposed to have had hardship—and has exploded the story. But Magellan the obdurate, the tyrant, the master, and his men the mutineers—all this is true, and appears duly in Mr. Finger's virile narrative. (p. 16)

Father McClorey's second lecture on Birth-Control. Plain talk but wholesome. Leaving all discussion to the Birth-Controllers has gone far enough. We fancy that Father McClorey leaves them little to say. These lectures were heard by huge audiences in Chicago and Detroit. (p. 7)

'My hand trembles but my heart does not,' said old Stephen Hopkins, as he set his signature to the Declaration of Independence. He was one of Rhode Island's two signers. (p. 20)

How a man's love for a dog issued in the establishment of a high art magazine. (p. 29)

Do you read the Office Chats? And the Editorials? There is good matter in them.

TEA and a talk with John Galsworthy! I know of no better or pleasanter way of spending an afternoon.

I was feeling good, this being the first sunny, warm spring day after so many that were shivery and wet—as I made my way up the steepish hill and so into The Grove, Hampstead, London's most charming suburb. Coming from the smoky heart of the city, it seemed as if I had flown to some ancient country town: narrow streets and alleys and lanes; old-world houses, big and little, Georgian, red-brick, quaint, kindly abodes of real beauty, retired from the riotous noisiness of today. Fully enjoying this, I strolled along The Grove, in the shade of tall trees, and so to Grove Lodge, where dwells the man I was come to see.

A typical Hampstead home; part of it old—Constable has a bit of it in one of his pictures of Hampstead—and part quite modern, but all of it comely. There is a little forecourt, within an openwork iron gate, paved and with an appropriate bay tree in a green wooden tub. Inside all is in keeping with the old-world style of the building; the furniture, the pictures and engravings, the knickknackery, the appointments of the dining room and table; flowers everywhere, bright and gay; and—all so comfortable and gracious.

A most genial welcome I had. Then—Mrs. Galsworthy presiding over a cosy tea-table; I, seated beside her on the deep, cushiony sofa, taking in a delicious cup of tea, with a slice of lemon instead of milk; mine host on the opposite side of the hearth, controlling the cake department.

### *Well, Look at His Portrait*

What manner of man is he to look on? Judging by the portraits I had seen, I was expecting to meet a somewhat austere man; in actuality I found that he was precisely the opposite. Pen-portraits are always unconvincing, unsatisfactory to the artist and to his victim. All I can do is to give my impression of him—not tall, not short; not stout, not too slim; scarcely looking his years, which are fifty-nine; alert; watchful, I think, of his own words and of those of others, with that same watchfulness which I am sure he keeps over his words when he is writing; eyes keen, gray, with a twinkle of humor ready for appropriate occasion; clad in a medium gray suit; and—well, look at his portrait.

Straightaway we got to talking of dogs. I thanked him for his beautiful and true little book, *Memories*, the biography of a spaniel that he loved of which the concluding words are: 'No stone stands over where he lies. It is on our hearts that his life is engraved.' Most understandingly did they both sympathize with me in my sorrowing for the old dog friend I had just lost.

'You miss so much, don't you?' said Mrs. Galsworthy, 'the pattering of their feet about the house; it makes one feel lonely for a long time. And your second love is never quite the same as your first, but is a great comfort.'

Which is true; almost too sadly true.

### *Far From the Fret and Fume*

He and I, we discovered, had been partly contemporaries at Oxford, and, as all true sons of Oxford do, we agreed that there is no more beautiful city in the world and that its little river, the Cherwell, is a perfect piece of rural waterway.

The room looked out through broad windows on a large garden—large for London—a trim, very green lawn, bordered with beds of flowers and surrounded by a dusky-red brick wall, over which peer the gables and roofs of old houses, in one of which lived John Constable, the painter. In a sunny corner was a roomy garden house, in which on warm days writing is done. The whole atmosphere more like that you expect to find in a quiet backwater of some lazy cathedral city, far from the fret and fume of life, than of a home on the outskirts of smoky, tumultuous London.

I asked whether there had been any special call to live precisely here.

'No,' he answered, 'for various reasons we had to leave our home in Devonshire, and I can't live, certainly can't work, right in town; too much noise, and the climate's depressing. The air up here is fresh and good. We were looking for a house here that we had liked when it was being added to twenty years ago, and couldn't then get. We couldn't find it! All of a sudden I said: "I believe that's it, hidden away there." I got up on a fence and looked over. It was! We went to the door and asked if by any chance it was now for sale. Again it was! And here we are! It gives you roots at once to get a house you tried to get twenty and more years before!'

(Concluded on page 26)

# A Mixture No Nation Can Stand

## America's Stomach Revolts at Concoction of Outlawed Liquor and Crooked Politics

By ALLAN L. BENSON

WE ARE going to quite a lot of trouble in this country to ascertain whether we can stand outlawed booze and crooked politics—mixed. We stood booze for three centuries, before it was outlawed, and, though it did us much harm, survived it. We have always suffered from a certain amount of crooked politics. During the days of lawful liquor we stomached many a mixture of politics and booze, but never until now did we have to deal with a mixture of outlawed booze and crooked politics—a blend that is beginning to sputter from machine guns in the outlying districts of Chicago. Mayor Dever had scarcely finished defending the fair name of his city before a senatorial committee in Washington when the concoction exploded, killing an assistant prosecutor and two crooks with whom he was riding, and causing a Cook County judge to declare that, unless certain evil practices were stopped, the city would yet be in the hands of a mob. What has happened in Chicago can happen and may happen anywhere else.

It should be plain to almost anybody that illegal booze and crooked politics cannot be safely mixed, yet this is the one question that arises from the growing tumult over liquor. There is not a wet leader in the country who does not know that the Eighteenth Amendment to the Federal Constitution can never be repealed. There is no person in the country who can read who does not know that so long as the amendment exists it will be unlawful to make and sell any intoxicating drink. Even if Congress were to enact a law purporting to legalize a drink that was in fact intoxicating, the act would be unconstitutional and the United States Supreme Court could do nothing else but set it aside.

So long as a majority of the members of the Supreme Court can read and understand plain English there is not the slightest possibility that any intoxicating drink can ever be legally made and sold in this country. What any state legislature may say to the contrary will have no more legal standing than would the same words if uttered by an inebriated gentleman leaning against a telegraph pole at two o'clock in the morning looking at the moon.

Before booze can be made legal in this country the wets will have to control a two-thirds majority in each house of Congress and a majority in three-quarters of the state legislatures. Nothing of the sort is even remotely possible, even if one look forward half a century. As a matter of fact, the farther one looks forward the slimmer is the chance of such a wet victory, because booze has been dying out of the United States ever since it came into it. Its grip is being loosened all over the world, even where there is no prohibition. A saner spirit prevails.

### A New Thing in Prohibition

Is it possible that any new thing can be said about prohibition? If you doubt it read this article by Allan L. Benson. Here is something fresh. The whole prohibition question is going to be thrown into politics. A thirst is to become a national political issue.

For years we tolerated a mixture of politics and booze, but now we have to deal with a mixture of outlawed booze and crooked politics.

Such facts, however, do not disconcert such gentlemen who, as a wet United States Senator declared, would have their alcoholic drinks, 'constitution or no constitution.' They are going about it to break down the Volstead law if they can, and trample over the Constitution that they have no hope of getting out of their way. The whole question is going to be thrown into politics and the dry leaders expect that the liquor issue will be the big thing in at least the next two presidential elections. It may last longer than that. The drys do not intend ever to quit so long as prohibition is under fire. Nor do they expect the problem to be settled speedily. Neither side has any such expectation.

Wet gentlemen who are sitting around the country with their tongues out, expecting almost any time to see light beer and wine with a little whisky under the bar would do well to wake up. Nothing of the sort is in sight. The most that wet leaders hope for is to control Congress in six years. The worst that dry leaders fear is a temporary defeat somewhere on the road to final victory, and if such a defeat should ever come they believe the dry sentiment of the country would insist that all lost ground be recovered.

The day is near, according to those who know what the dry forces are doing, when those who back the Anti-Saloon League will insist that such presidential candidates as receive their support must be dependably dry, officially and privately. In politics there is a good deal of difference between being dry and being dependably dry. The late Mr. Harding was officially dry, but not dependably so because he was personally wet. There is no reason why his record in this respect should not be discussed, even though he is dead, since it is a part of the history of the United States.

Mr. Harding was the kind of a prohibitionist, of whom there are millions in this country, who was personally wet, yet down in his heart believed in the value of the law. He used to say to Wayne B. Wheeler: 'You needn't talk to me about the virtues of prohibition, Wayne, I know drinking is bad for people and believe in ending it.' Yet when Wheeler urged him to cease drinking on the ground that he was setting a bad example, the most that Wheeler could get from Harding for a long while was that some time or other he would swear off. As a matter of fact, he did not swear off until he was on his way to Alaska.

At Denver he made a very vigorous prohibition speech. After he made it he did not feel that, in honor, he could go on drinking. He swore off, and one of the correspondents who accompanied him sent a dispatch back to his New York newspaper that was printed under the heading, 'Harding Quits Drinking.' Yet never was there a time when Harding, as President, was not officially dry. He had to be since prohibition was the law and he had taken an oath to enforce all laws. But as a matter of private habit he was wet. And it was very unfortunate for prohibition that it had to come in under this unlucky star. Those who would like to violate the law looked to Washington for a sign as to whether it would be safe to do so. What they saw and heard gave them heart. They went ahead. They organized, expanded and dug themselves in. Gifford Pinchot once told the writer that if Roosevelt had been President when the Volstead law came into existence he would, within three weeks, have made everybody understand that it would be extremely unsafe for anybody to violate it and that, as a consequence, the law would have been accepted and obeyed. Certainly Harding's attitude helped to make the situation that now exists.

There is now a division among the dry leaders as to whether they should make a fight in both of the great parties to compel the nomination of presiden-

tial candidates who are actually and dependably dry. Those who believe this line will be drawn in 1932 are not so sure about the wisdom of drawing it in 1928. It is doubtful if it will be drawn when Mr. Coolidge's successor is chosen. Both candidates will have to declare, of course, that they are in favor of enforcing the law so long as it is the law, but one or both of them may really be very half-hearted about it. It will be the pleasant task of the voters to look beneath these official utterances and try to determine which shell the pea is under.

The Republican candidate, whoever he may be, will probably stand for prohibition as a general proposition, while maintaining silence, if he can, as to whether he favors a redefinition of what constitutes an intoxicating beverage. The Democratic candidate also will probably stand for prohibition, but he may have a great many things to say with regard to the right of each state to declare what, within its limits, shall constitute an intoxicant.

In this respect, New York is setting the pace. The people of the State of New York are to vote next autumn upon a series of involved questions prepared by Elihu Root, the purpose of which is, as Senator Borah has pointed out, to nullify the Eighteenth Amendment. The questions are phrased in fine words—there is even something said about making only such changes as will permit the sale of 'beverages not in fact intoxicating'—but the plan leaves to the several states the right to declare what, within their borders, shall constitute an intoxicating beverage. In other words, the Federal Government is asked to step aside and let the various states declare for themselves what a part of the Federal organic law means. Mr. Root did not suggest that the Federal Government step aside in the matter of defining other parts of the Constitution. It is only with regard to the Eighteenth Amendment that he proposes such an innovation.

Of course Senator Borah is entirely right in declaring that if the New York plan were to be followed, nullification would result. There could be and might be forty-eight different answers as to what constitutes an intoxicating beverage, and some of the answers would be wet enough to keep the whole country saturated.

The strategy of the wet leaders lies in reviving, as far as booze is concerned, the old doctrine of states' rights. With complacent courts and loose legislatures enough wet spots could be sprinkled about the country so that the dry states could not possibly be kept dry. Of course there is no assurance whatever that the courts would be complacent, and the probability is that they would not be, but the wets are so hard pushed that they are turning down nothing that might possibly prove to be a way out.

The main thing is to keep up a clatter and, if possible, convince the people that prohibition cannot be enforced because so many are opposed to it. Without a leg of law to stand upon they have nothing to lose whatever may happen and there is always a possibility that something may happen to change the outlook. That is why they clamored for hearings before a senatorial committee last April, as it is also why 'straw votes' were taken in such newspapers as were willing to play the wet game. The hearings amounted to nothing except that they gave the wets an opportunity to get out their propaganda through the press of the country. The wet propaganda was, of course, offset by the propaganda of the drys, yet the wets, nevertheless, had again reminded the country of their existence. The straw votes, too, added to the clamor and convinced those who were already convinced.

When one thinks of what crooks can do with ballot boxes guarded by officers and covered with the sanctity of the law it is humorous to think what wets could do—and doubtless did—in a straw vote that violated no law regardless of how many fake votes were registered.

To make a big showing, all the liquor interests had to do was to buy extra copies of the papers, clip and mark the coupons and put them in. Yet all of this wet propaganda did one thing that perhaps the wets did not expect it to do and certainly did not want it to do—it aroused the drys who went to sleep after the Eighteenth Amendment was adopted. It did more than that. It brought out support that the drys had never before been able to get. A group of Episcopal bishops whom the anti-saloon forces had long vainly urged to endorse prohibition began to speak vigorously about the time of the Washington hearings. Also, little rivulets of money began to pour into the anti-saloon coffers, showing that the springs still exist that once produced funds so voluminously. In fact there are many other indications that 'the wets will defeat themselves.'

While there is no conceivable chance that the wets can ever win, it seems certain that the liquor question is destined to plague American politics, city, state and national, probably for twenty years. It is a pity, because when public attention is concentrated upon a single subject opportunity is offered to smuggle in much selfish legislation that would otherwise be defeated. It is unfortunate, too, that until such time as the people shall become thoroughly aroused the mixing of unlawful liquor and crooked politics will continue. But what else is there to do but fight out the battle to the end? Mayor Dever, at the Senate hearings, spoke feelingly of the deplorable conditions that law violators had brought about and declared it to be the duty of Congress to work out a plan that would be satisfactory to both sides. There would be no doubt of the duty of Congress to do this if it were intellectually conceivable that such a plan could be drafted. In the very nature of things both sides cannot be satisfied. For the truth of the matter is that one side wants intoxicating beverages made and sold and the other side doesn't.

All of the wet talk about the desirability of having 'light wines and beer' and beverages stronger than the Volstead Act permits that 'are not in fact intoxicating'—all this talk is bosh. No wet wants wine, beer or anything else that is not intoxicating. No wine was ever made that couldn't intoxicate. Wine can be watered until it is harmless and a very few prefer to drink it that way, but wine thus watered would not satisfy the wets. Such beer as we used to make did not have the punch of whisky, but enough of it would intoxicate anybody. It did not make them climb telegraph poles, but it had an effect.

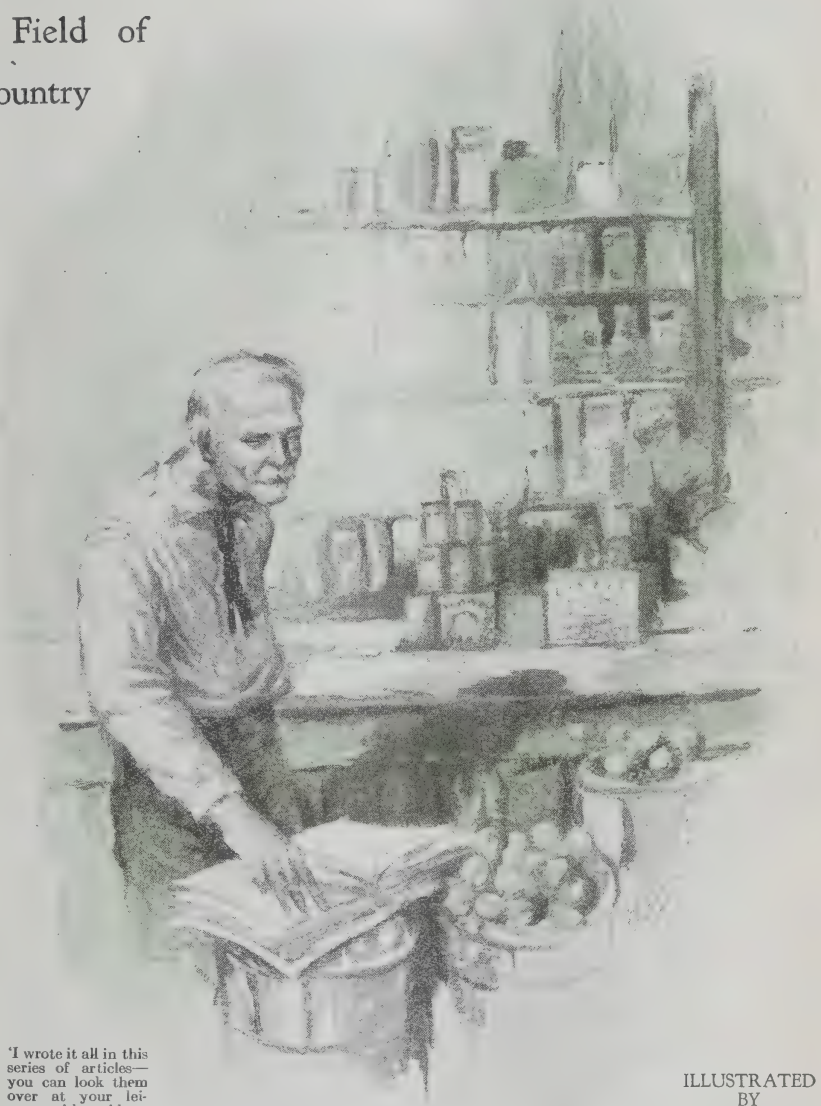
Granted that one-half of one per cent is below the limit of intoxication for most persons—what of it? Would it do any good to increase the legal limit to a point just below where it would become intoxicating? Would the wets be satisfied then? Everybody knows they would not. Canada's 4.4 beer makes no hit anywhere. Everything that could not intoxicate would still be near beer or weak wine. What wet cares for a little more alcohol provided the legal limit is still too low to feel? It is the feeling that the wets seek. Anything that exhilarates will intoxicate if enough of it be drunk. And the Constitution is the authority of the prohibitionists for saying that intoxicating beverages shall not be made or sold in this country. (Concluded on page 26)

## The Fight Must Go On

There is not a wet leader in the country who does not know that the Eighteenth Amendment to the Federal Constitution can never be repealed.

Before booze can be made legal the wets will have to control a two-thirds majority in each house of Congress and a majority in three-quarters of the state legislatures.

Despite this fact it seems certain that the liquor question is destined to plague American politics probably for twenty years.



So the fight must go on.

There is no room for compromise. Both sides cannot be satisfied. The drys are not going to put up with a make-believe enforcement.

# America Writes a Book

By DONALD HOUGH

## Author Thinks He Has Found the Most Crowded Field of Endeavor in This Country

'I wrote it all in this series of articles—you can look them over at your leisure,' he said.

ILLUSTRATED BY HARLAN JOHNSON

DULL, uncultured, money-grubbing America! With its nose close to the trail of gold, it goes on wagging its tail at the excellent trainers who would have it switch to daintier game. Here we are, a great, barbaric nation; our ideals soar no higher than a mashie shot from the rough; in terms of luncheon clubs we measure our cultural height. At home, in the hushed parlor, under a glass case, lies a book with a pink ribbon in it . . . Such is the picture painted by the Philistines among us.

'America has a book' is a bit of sarcasm which is dulled only by repetition. It springs from the old chestnut: 'What shall we give Uncle George for Christmas?' 'Well,' replies the foil, 'let us give him a book.' 'A book!' yells the star comedian, 'We can't—he already has a book!' Are the comedians done up in imitation of the negro, the theme varies. It centers in an indolent member of the race. 'Do you want to earn a quarter?' asks the interlocutor. 'No,' replies the weary one, 'I already has a quarter.'

And now—'America has a book,' say the dilettantish wits, and they snicker among themselves.

The proper gesture in the presence of this bit of irony is to smile languidly and shake the head in the manner of a person who sees no hope, or to look at your own neat set of the History of the World in the sectional bookcase and say, 'Alas! Only too true!' carrying the air of one whose heart bleeds for America.

When, a year or two ago, I heard an otherwise prominent person make a public declaration to the effect that 'America has a book,' my mind began immediately to revolve. After several days and nights of meditation I arrived at the following conclusion: 'If America has a book, there is every reason to believe that she may want another.'

While others were going around lamenting the fact that America had a book, I would steal a march on the world and write another one! Such was my resolve.

So I began. I wrote any number of things, of which this article is one. I served my time on a newspaper, and now I make what, in the face of devastating assertions by my wife, I still flippantly call a 'living,' with the aid of my typewriter. Profits, however, have been disappointing. After floundering around for awhile in a blue funk I decided, a year ago, to appoint myself an efficiency expert and to go into the matter in a spirit of the best scientific business tradition.

I went to bookstores and there I saw books of various sizes, shapes, colors and titles. I looked at the newsstands, and the statistical phase of my mind at once took note of the vast number of weekly and monthly publications. Looking into them, I saw that a small part of each one was given over to literary matter, and it occurred to me on the spot that much of this must have been written by somebody other than myself. It began to dawn on me that possibly there was, after all, some measure of competition in my chosen field of endeavor.

I decided to make a chart of my findings, so first of all I took a clean sheet of paper and across the top of it I wrote, in fine, bold characters, 'Writing is a business. I am in business.' Writing, I told myself, is a business just as selling groceries or long-handled shovels is a business. 'Let us,' I said aloud, 'apply some simple business principles. Here I am in the city. Cities are full of writers. Competition cramps my style. It is plain that my course is to leave here, go to some remote corner where there is no competition in my line, just as I would if I were a dealer, let us say, in long-handled shovels.'

# The Price-Fixing Association

## How It Ingeniously Evades Those Troublesome Anti-Trust Laws

By HUSTON THOMPSON

'ONE thing thou lackest,' said the Master to the rich young man. It is just so with the Commander-in-Chief of Big Business as he sits on the top of a colossal combination of formerly competing corporations. The rich young man lacked the imagination that would have enabled him to see the joy he would get in giving. Likewise the commander lacks the commercial imagination to secure and retain a stabilized market.

Instead of jumping into the factory and fighting its costs, and then passing the savings on in reduced prices, he visions a market where price is king and he its master. And why shouldn't he? He has a plant in every key position—the power to dictate the price in his industry—tariff protection.

As he surveys the dyke that lies between him and the ocean of competition outside, he sighs almost with contentment. But only for a day. Despite his magnificent foresight, he discovers that an enemy has scaled the wall. It is the old specter that comes as a thief in the night, the Law of Diminishing Returns.

Somehow, the miserable ultimate consumer, gazing at his shrinking pocketbook and studying the mounting market prices, finally and suddenly finds he can get along without the commander's highly advertised high-priced commodity, or with a substitute for it. Then the adaptable commander, forgetting those things which are behind him, changes front and casts off the ill-concealed patronizing air with which he had been accustomed to treat his pseudo-competitors. In the language of his letters and documents now reposing in the files of the Federal Trade Commission, he says, in summoning them to take common counsel, 'Come, let us be brothers.'

Of course it is too much to expect that he should invite the ultimate consumer into that brotherhood. Only a man with an imagination would do this, and a man with an imagination would hardly be a commander of a combination.

### *What Happens Out in the Hall*

But if the commander lacks in imagination, he does not lag in craftiness. Those anti-trust laws, be they ever so feeble, are still on the statute books and he and his lawyers know it. So the conference that he calls springs up from nowhere and moves on without his presence. An association comes into being. A secretary is chosen, and from out the blue there come mysterious suggestions like this:

'We must curtail production until the demand is greater than the supply. We must put on an advertising campaign that will lure the buying public back. We must lower the price only just enough to bait the consumer. We must not all bid for the same contract. Any man who bids below a certain suggested price is not a patriot. Lack of patriotism may mean disaster to all in a price war. It will cut to the quick and spell ruin to many.' Needless to say, these mysterious suggestions have the same effect on the members as the mandate of an appellate to a lower court.

Such is the composite picture drawn from the study of countless associations, though the somnolent minutes of their meetings seldom if ever report a word of these illegal acts.

How these associations frequently operate is revealed by the statements to the commission of a secretary of an oil association, only four of whose members bid for the contracts to supply the city of Los Angeles with gasoline, and all of whose bids were identical. This secretary said it was not agreed at any meeting that only four companies should bid. *The agreement did not appear in the records because it was not made in the room where the association held its meetings but out in the hall after the meeting*, or at private offices of members of the association and others.

Their custom, he said, was to hold a regular meeting at which minutes were kept. Then 'the members would drift out in the hall and hold another meeting.' 'They usually went out arm in arm.' 'The chances were that they had not seen each other for a week' and naturally this absence made the competitors chummy. After the crowd was outside 'they did the real thing they were interested in.' They agreed on the price and then 'they passed the information to the secretary' since he was floating along with drifters.

In all associations there comes a day when, driven by necessity or desire for volume, or revolt of conscience against the unfairness of his associates toward the ultimate consumer, some daring or desperate member of the association cuts the price. The news flies abroad as fast as gossip. With imperious command the deserter is summoned to appear before a court-martial of his peers to answer the charge of actually playing fair with the law and the public and thereby assassinating his associates' business.

If in fear he crooks the knee in abject apology he is permitted to retreat, and return to his place of business, having been hazed into utter humbleness. *(Continued on page 27)*

The agreement did not appear in the records because it was not made in the room where the association held its meetings, but out in the hall.

IN THIS second article on Birth-Control, Father McClorey handles some of the arguments of the 'controllers' and indicates some of the undeniable consequences that would follow a general adoption of the unnatural practice. The first of these articles appeared in THE DEARBORN INDEPENDENT for June 26. Father McClorey approaches his subject with unusual frankness; he makes a profound impression on a subject which is not generally popular. Seldom has the subject received such searching treatment.

# Birth-Control—a World Blight

## Father McClorey Says If Propaganda Succeeds, Earth Will Become a Desolate Planet, Drifting Through Space, as Dead as the Moon

By REV. JOHN A. McCLOREY

IN A FORMER article, I supposed that Birth-Controllers sincerely aim at the amelioration of the race and I maintained only that their means are not necessary nor sufficient to that end. But does not a suspicion rest upon their sincerity? Surely there is a well-founded suspicion shadowing the Neo-Malthusian movement. For it is a direct and powerful appeal to sexual indulgence. Even unconsciously to themselves, very likely, their love of indulgence is their motive for Birth-Control, whereas their reasons for it are only plausible arguments to bolster up a course of action which they pursue for pleasure's sake. At any rate, it is a fact that those who practise Birth-Control most widely are the well-to-do, who according to the Birth-Control program are the very ones who ought to insure the welfare of the race by having and educating choice children.

But supposing again the sincerity of Neo-Malthusians as to the end they have in view, I shall ask: Are their means right or wrong?

In answer to this question, I say and shall establish that Birth-Control is, first, wrong in itself, and, secondly, wrong on account of the awful effects which proceed from it.

***Wrong in Itself***

If a thing is wrong in itself, it may never be done no matter how excellent is the end in view. For the end does not justify the means. Also a thing which in itself is indifferent, neither morally good nor bad, becomes morally bad if the evil results which flow from it are incomparably greater than its good effects.

Birth-Control is wrong in itself because it is against nature. The natural effect of the marriage act, in favorable circumstances and under propitious conditions, is conception. Birth-Control directly and intentionally frustrates that effect by physical or chemical means. Hence, Birth-Control is an unnatural sin (and a grave one because opposed to one of the most fundamental activities of nature); therefore the God of Nature must prohibit it with the grave sanction of His law.

In opposition to the argument from nature against Birth-Control, Neo-Malthusians say that many things against nature are not wrong; for example, says one of them: 'We interfere with nature at every point. We shave, cut our hair, cook our food, fill cavities in our teeth (or wear artificial teeth), clothe ourselves, wear boots, hats, and wash our faces; so why should Birth-Control alone be sacred from the touch and play of human molding?' And Doctor Dawson, the King of England's physician, says: 'Birth-Control is said to be unnatural! This word "unnatural" perplexes me. Why, civilization involves the chaining of natural forces and the conversion of them to man's will and uses. Much of medicine and surgery consists of means to overcome nature. It is no more unnatural to control conception by artificial means than to control child-birth by artificial means (anesthetics). Overeating, overdrinking, oversmoking, oversleeping do not carry condemnation of eating, drinking, smoking, sleeping, work.'

***Not Control But Frustration***

The *control* of nature is right. But is the *frustration*, the *destruction* of nature right? The destruction of the *excesses*, the *defects*, the *afflictions* of human nature, that is, the cutting off of superfluous hair or the amputation of a gangrenous limb, is right. But is the destruction of the *blessings*, the *perfections* of human nature right? The sacrifice of a *physical* part for the good of the *physical* whole is right.

The sacrifice of a human being for the family or state is not right when it takes the form of Birth-Control, because Birth-Control is not *control* but frustration of human nature; a child is not an *affliction* but a *blessing* of nature; Birth-Control frustrates not a part of the child for the whole child, but the whole child; a child may not be frustrated for the good of the family or state. For a child (unlike a physical part of the body with reference to the whole body) is not intended by nature to redound exclusively to the advantage of the family and the state.

The evil effects of Birth-Control are so great (as we shall see) that in view of them, an exception to the general law against Birth-Control should never be allowed. One of these, which by way of anticipation I may mention here, would be the ever-increasing control of the State over fundamental rights of individuals, consequent upon the State being given the right to mutilate the vicious and imbeciles.

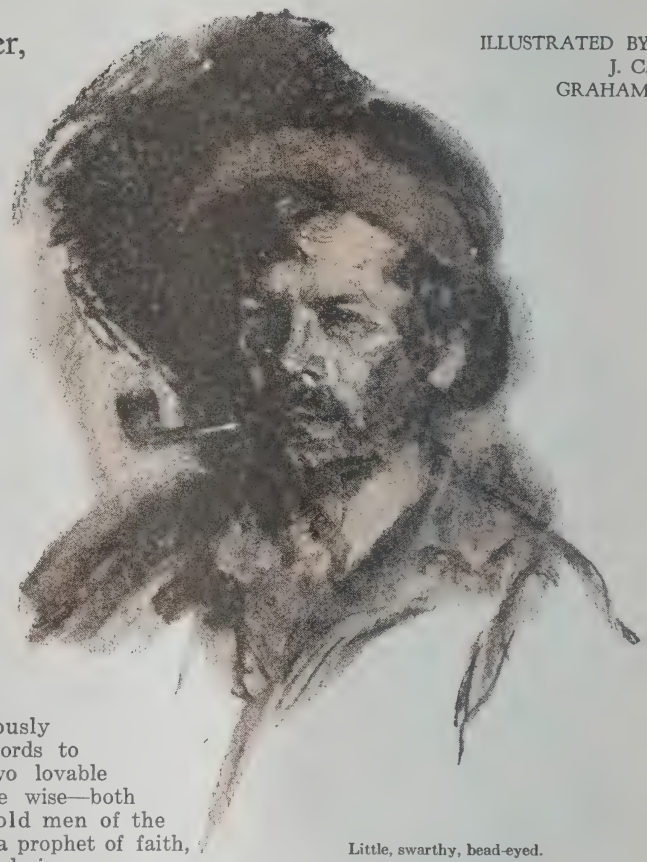
There is no parallel between the State's right to execute criminals and the supposed right to contracept undesirable children. For the former are punished by the State for guilt, but an unborn child is not guilty of any crime. By the execution of a criminal the State wishes to warn other men against the commission of crime. But it is absurd to suppose that the contraception of one child would be a warning to other possible children not to come into the world.

By way of a second objection, Birth-Controllers say: If Birth-Control is wrong then Nature herself does wrong. For she frustrates many conceptions by wasting procreative force when conditions are not favorable for conception.

That exuberant waste is intended by Nature to make conception more certain, easy and perfect. Besides, Nature or rather the Author of Nature may do things that we under His law may not do. For example, Nature cannot be held responsible for killing a man by an earthquake; whereas you and I would be responsible if we killed a man with a sword.

***The Reason for Celibacy***

Third, they say: If Birth-Control is wrong, celibacy is wrong.



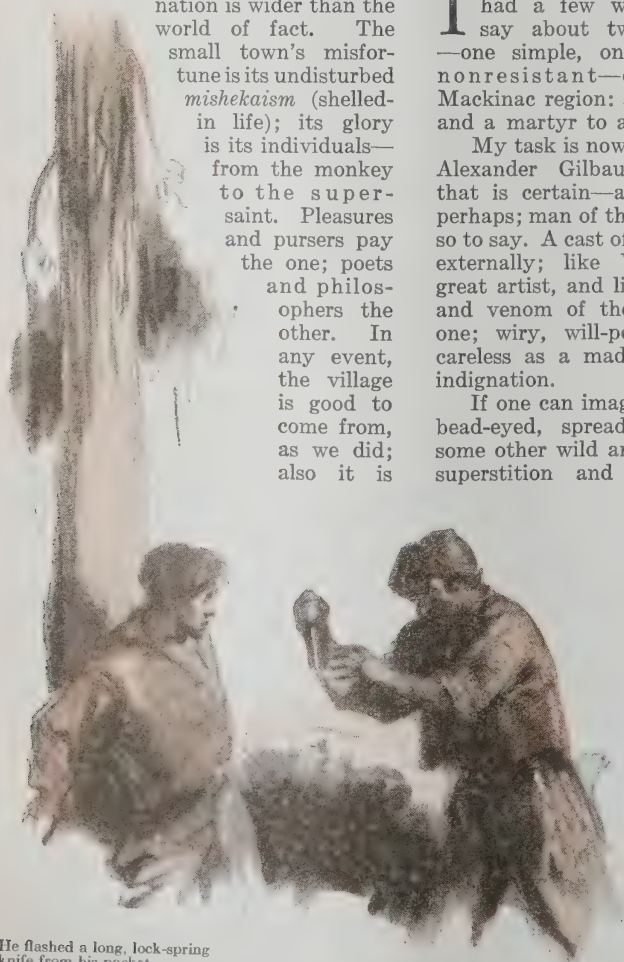
There is quite a difference between refraining from using a faculty and frustrating its activities after use. Even refraining from using a faculty is wrong *as a rule*, since God gave us our faculties for use. But there are exceptions to every rule. There is high authority in Holy Scripture in the words of Christ and St. Paul for the exceptional state of a celibate life. *(Continued on page 22)*

# Pere Gilbault, le Coureur des Bois

## A Man of Northern Michigan—Philosopher, and Artist for Art's Sake

By IVAN SWIFT

ILLUSTRATED BY J. C. GRAHAM



Little, swarthy, bead-eyed.

IN EXHIBITING these unskillful portraits of the neighbors of my youth I can only plead that I am compelled by their tenacious occupation of my mind. The motive is not even a conscious sense of justice, least of all a rebuke to others I understand less sympathetically. I cannot, however, refrain from the reflection that I am writing in the days of impudent satire upon the small-town citizen—a reflection which comes to me only after I have taken my choice from the same source and appeared in public in his company, shamelessly.

I believe it is not beyond possibility that pompous boosters and nervous reformers were also in ancient Greece, Carthage and even Egypt—cities and towns; but there were and are other types for our thought and their places in the procession that delights all who would not grow old.

The world of imagination is wider than the world of fact. The small town's misfortune is its undisturbed *mishekaism* (shelled-in life); its glory is its individuals—from the monkey to the super-saint. Pleasures and pursers pay the one; poets and philosophers the other. In any event, the village is good to come from, as we did; also it is good to go to, except where it has been 'improved' since 'the Devil made it'—if he did. His Majesty was a gentleman of lively wit and almost human ingenuity; but he lost his stakes of humility to a previous generation.—*Ivan Swift.*

He flashed a long, lock-spring knife from his pocket.

### PERE GILBAULT

I HAVE previously had a few words to say about two lovable—one simple, one wise—both nonresistant—old men of the Mackinac region: a prophet of faith, and a martyr to a losing cause.

My task is now to be more difficult. Alexander Gilbault was the artist, that is certain—artist for art's sake, perhaps; man of the world, on all fours, so to say. A cast of Mephisto, almost—externally; like Whistler the other great artist, and like him, full of fight and venom of the bee, and busy as one; wiry, will-powered, courageous, careless as a mad man—in righteous indignation.

If one can imagine a little swarthy, bead-eyed, spread-legged bobcat, or some other wild animal—burning with superstition and inspired to lively visions comparable to Joan of Arc's, in his everyday life; trying to drive the finite and the infinite in team; hands quick to the hardest task and mind on the wing, awake or asleep—that might apply to Alex. Gilbault, but it would not cover him.

There is an element of mystery in art and some persons that leaves us tongue-tied; more between the lines of them than in the lines. Strange tricks Nature plays on us and in strange places! Here is a man not easy to forget—a wind, a frost, a flame! And one could as easily put the crackle and color of these elements into dictionary-words, as convey the speed, inflection, sympathy and snarl of this diminutive French-Canadian's speech. We can only think of a gnome, carrying the mail on his back from Cheboygan to Traverse City—bounding, gliding, hiding, screaming, till exhausted; and wilting and blowing away like a leaf—veins trembling with justice, honor, hatred, beauty and single-handed defiance—to his grave and first real rest. Indeed, his grave can be fitly marked only with a steel-blue dragon fly; one that has sewed up my boy ears with such wild tales of 'ghost-hogs' and 'horned sea-serpents' as cost me sleep and sent me in wide circles around trees in the pale moonlight!

I shall not forget how he flashed a long, lock-spring knife from his pocket to illustrate to me the Indians' ancient art of scalping—and how I went pale and fled from the flames in his eyes—and his loon-laughter! Oh, he was not dull—this Robinson Crusoe of the pebble isles and rider on magic rugs of elm-bark!

He watched the (Continued on page 30)

# MR. FORD'S PAGE

OUR age may be described under many terms, and a fitting one would be The Age of Accuracy. The former very wide margin of uncertainty which bordered many of our actions is becoming narrower all the time. Less is left to chance or guess. We measure time in smaller fractions than before and can now do much more with our day. We have made doorways into sciences where we must walk with the utmost precision to avoid disaster. On every hand there is accuracy and a demand for more accuracy and an increase of the technical means of obtaining accuracy.

This may seem rather at odds with the common opinion that ours is a slipshod age. Because we make so many things in large quantities the impression easily forms that such accomplishment must mean enormous haste, and the haste mean careless work.

Quantity production, on the contrary, has made accuracy more necessary than it ever was before. It was only under the pressure of quantity production that we got the precision instruments which enable men to work to the one ten-thousandth of an inch in the measuring and fitting of materials. Mass production has made inevitable the raising of all standards of quality and skill, for reasons which a moment's consideration will make apparent.

The keynote of modern production is economy. This does not mean skimping, but the utmost use of time, energy and material, without waste. This economy is possible only by the achievement of the utmost accuracy. For unless accuracy is obtained there cannot be speed of production, economy of labor and material, and cheap distribution. So here we have accuracy as the guardian of production and distribution in a way not commonly considered.

As to speed, it is clear at once that you could make a million silver dollars all alike much more easily than you could make each dollar different. There are some things to be said for handicraft, but quantity and undeviating standards of work are not among them. The charm of antiques is that however much alike they may seem to be, they are different; they show the individuality of the man or woman who made them. We could hardly look for that, nor would it be desirable, in commodities which we need in great quantities, such as bathtubs, motor cars or sidewalks. If you are going to make a large number of any useful commodity, you must do so speedily, and if you are to do it speedily it must be done accurately. For almost every commodity consists of many different parts which must be joined together, and if there is no accuracy in the production of the parts, the task of joining them together and making them fit takes time and labor which accuracy might have obviated. The matter of assembling a machine or any other commodity is simplified and made sure by the accurate production of the parts. Out of a million silver dollars, take any two and they equal each other. This is the result of accuracy.

*INSTEAD of our great quantity production making us an age of hodge-podge methods, it has made us an age of accuracy. The greater a process the more accurate it must become. Small inaccuracies become glaring defects when magnified a million times. Mass production is impossible without accuracy to the ten-thousandth of an inch. The time required to fit inaccurately measured parts, and the resulting waste of material, consumes all economies of manufacture. Pennies and nickels make or break a business unless financial accuracy is secured. The economic value of accuracy is impossible to exaggerate.*

Then, as to waste. Material can be economically used only by having its use carefully planned. If metal is to be prepared in sheets of certain size, or lumber is to be sawed according to pattern, an accurate plan will reduce the waste of material. Otherwise there will be too many sides and ends and corners and shavings left over, and all this is waste. Waste indicates that somewhere accuracy was lacking as between the form of the material and the thing to be made. By accurately studying the job this waste can be eliminated. It may be foreknown to an inch or an ounce what will be needed, and this knowledge is exceedingly valuable because it means wealth.

Shortsighted minds sometimes express contempt for these penny-saving methods. They forget that a matter of half a cent may aggregate thousands of dollars in a single day in a big industrial plant. Add fifty cents a unit on an annual production of three million and you have added one and a half million dollars. The very size of modern business has compelled managers to be accurate down to the matter of half a penny, for half a penny may be the leak through which the whole vigor of the business drains out.

Again, in large units, which may be more cheaply shipped knocked-down and then set up for use a thousand miles from the shop, accuracy is essential. Indeed, shipping costs could not thus be lowered were it not for accuracy. But where a commodity is manufactured accurately and flawlessly it may be shipped in knocked-down form anywhere and set up anywhere with perfect results, and with additional economy to the purchaser in freight rates. This would not be possible if all the fitting had to be done after the piece had been manufactured. The fitting is done before; it all takes place in the careful mind of the manager.

These are a few aspects of the economic value of accuracy.

## *Discovered!*

THE English are finding us out. When they first condescended to notice that we really were making quite a go of it on this side of the Atlantic, their reaction was one of astonishment, which never lasts long with an Englishman; he proceeds at once to analysis. Now analysis has come. The first report made in England was the astounding one that Americans worked no harder than Englishmen. There were more fat business men in America than in England. They do not move nearly so rapidly as in London. They do not kill themselves with business at all—they have other methods for that.

This was rather a facer to the English and to us. We hardly realized till then how true it is. We do not work harder; we only work to more purpose. We make machinery do our work. It is true that the English miner—who now raises the loudest howl—has a shorter working day than even the American workingman (the miner's day is by statute fixed at seven hours) but on the whole the British workingman works longer and harder than the American, for less wages and to considerably less purpose. The effort is greater, the commodity production and the wealth production is less. In America the effort is less but because intelligently controlled the product is greater.

England's first discovery that it was not horse-like work that made America prosperous was a good one. Now comes the second: American business may or may not be big—normally; it cannot be determined now because the whole thing is shadowed in debt.

The second discovery is equally keen with the first. How much would the round swelling total shrink in honest liquidation? How far would 'pay as you go' reduce the huge proportions of our business? We do not know. The English do not know. No one knows. It has yet to be proved that debt-making power and purchasing power are synonymous. It has yet to be proved that debt and credit are exactly the same thing. There are no interpreters in this field. Those who create the situation are blinded by selfishness; those who might interpret it are inclined to regard it as an act of God and not a possible folly of man. So, we shall have to await the event itself.

However, these two discoveries concerning us, by the nation which at present probably is our most intelligent observer, are well worth considering.

## *Army of Faith*

ANY way you look at it, the Eucharistic Congress was a marvellous event. As a pilgrimage, it brought back the color and romance of the Middle Ages. As a piece of management it was colossal in its implications, resembling nothing in our day so much as the administration of a great army. As a religious gathering it testified to the power of the church over its members, or the power of the faith over its devotees. In all it was an international spectacle of surpassing power, showing a unity possible to every tribe, kindred and tongue in the realm of the spiritual. That in these modern days a million people should travel to a great commercial center for the sake of a religious rite, and there spend a week in religious celebration, and that they should do this as the result of the example of an obscure woman in France, and that from so humble a source vast concourses of people should assemble annually, country by country, is a matter of more than passing importance. That people are found who believe to so great an extent that the massing of such a concentration in worship, that the focusing of such intention of mind, actually projects the power of the spiritual realm into the region of the material, is a fact of notable significance.

There is no general agreement of religious opinion in the United States, though the majority opinion might be regarded as Protestant. But this lack of agreement as to doctrine and tenet and authority meets in a larger agreement to disagree in all good will and honesty and righteousness. It was regrettable that the spokesman of the President at the Eucharistic Congress should have thought it necessary to speak of 'tolerance' for any religion in this country. The term is offensive. Any religion worthy the name may be observed in this land without molestation. The only intolerance here is that of the anti-religionists who are against every religion but mainly Christianity.

True Christianity does not seek to usurp the power of the State, nor make alliance with anti-Christian forces. Sometimes religion has been used as a cloak to cover imperialistic designs—not the imperialism of truth, but of an organization. When used to that end, it will always encounter resistance. But for religion as the worship of Almighty God, the search to know His will, and the conduct of human relations in the spirit of righteousness, there will never in this country be any want of freedom.

## *Saves His Bacon*

ALTHOUGH 14,889,703 ballots were cast for confiscation and only 542,311 against, Wilhelm Hohenzollern retains his estates in Germany. But he retains little else. The astounding vote of twenty-eight to one in favor of confiscation indicates that Germany in her heart has wholly rejected the former kaiser.

But how is it that such an enormous majority of the vote failed to accomplish the confiscation? The explanation is that it was less than a majority of the nation's qualified voters. The terms of the election specified that *a majority of the qualified voters* were necessary to determine the issue. That was imposing an impossible condition, of course, because people do not vote in such numbers. But as it was, a full thirty-five per cent of the voters favored confiscation. Had a complete vote been polled the kaiser would have been stripped by a ninety-five per cent majority of the German Republic.

Doubtless there will be criticism of the conditions imposed, and doubtless they were imposed by royalist influence with a view to their impossibility. Added to that there was the opposition of Hindenburg to so crude a proceeding as confiscation. Yet it is permissible for officials to plead that if so serious an act as confiscation is to be performed, it should be the act of the whole nation, that act certified by a majority of all eligible voters, and the responsibility thus placed where it belongs. Germany never was mistress of wisdom or tact in these matters, she always did colossally the wrong thing, and there is no reason to expect a sudden access of discernment now.

## *'Ware the 'Wet' Press*

NOTHING is more amusing than to read the news dispatches dealing with 'dry' hearings at Washington. Even the supposedly impartial press reports strain ludicrously to make it appear that information secured from the 'dry' workers was wrenched, forced, dragged out of a regular knock-down resistance of the 'drys' against the truth. The 'wets' are the frank, open, honest, transparent, pure advocates of truth; the 'drys' are the shady, furtive, dissembling practitioners of deception and concealment.

Well, this is war. The forces of the Government have been used without reserve to intimidate believers in the Constitution, and have never been used with anything like full force to expose the colossal and profitable disregard of the Constitution practised by men who have reason to think that the Government will act rather delicately toward them because of their connections. If this is a strong statement, there comes a time when, as between the Government and the Constitution, there is only the Constitution to choose.

That war is on now and the only weapon the 'drys' can use is the truth, and to accuse them of refusing to use their own best weapon is rather silly. Great ado is made about the half-dozen members of Congress who were paid for speeches made in the prohibition campaign. The only ground for this inquiry is its possible use in preparing a charge that members of Congress favored prohibition legislation because they had previously been 'retained' as prohibition speakers. Every fact in this connection should be laid bare, because the facts will show that political figures who openly espoused prohibition did so at their political peril, and the amounts received were not large enough to pay the average 'wet' petition-circulator's daily drink bill. We can remember most of those speakers in a day when prohibition was extremely unpopular; at exceeding risk they were willing to certify by their public appearance that prohibition was sufficiently important and sound to command the approval of men of position. The people of the country who were vitally interested in the removal of the great curse of a whisky-sodden people and a Government in partnership with booze did not think it immoral to provide the expenses of those men while they traveled and spoke. They do not think that all the armament of Congress and the press can make it appear immoral now.

Let the facts all come out, and then let the astute investigators uncover the facts regarding the 'wets' and bootlegging in this country. Having finished with that, there will be no more excuse for the fragile fiction that the country's mind is not made up to be 'dry.'

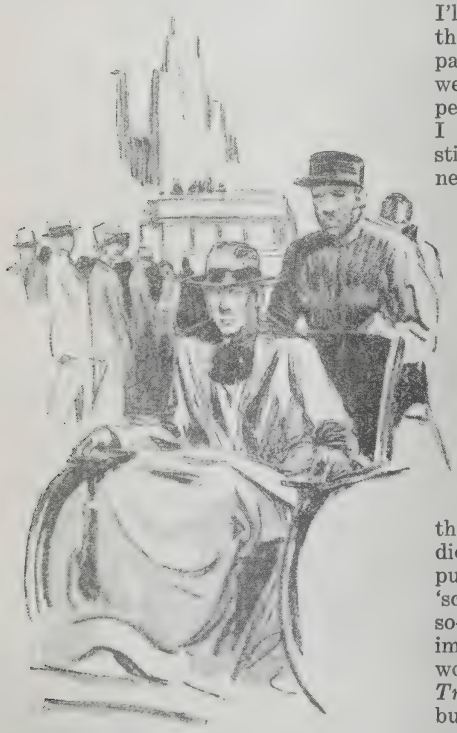
## *Money*

THE manipulation of money is a remaining wrong which challenges every sense of proportion and justice. Money is no longer at the command of service and labor, but is under the permission of its owners and brokers. It is no longer a public commodity under control of Congress, but a private monopoly under control of concessionaires. A nation that would shriek with horrified surprise at the suggestion to let or hire the United States Army to a private corporation lives in blissful ignorance that the Uuited States monetary system is privately owned and controlled. And directly alert minds become awake to the fact they go off on some private remedy of their own, and are thereafter anchored to its defense for the rest of their lives. The central need is to focus public attention on the *system;* the penetration of a hundred million pairs of eyes will be very potent.

# An Intimate Story of a Best Seller

## After Many Disappointments, Struggling Author Finds a Publisher and New Novel Reaches an Appreciative Public

By J. BRECKENRIDGE ELLIS



ILLUSTRATED By J. COZZY GRAHAM

From boyhood the advertisements of successful novels formed my favorite reading.

FROM boyhood the advertisements of successful novels formed my favorite reading—they were so often more alluring than the books they described! And when I heard of a 'best seller,' I wondered whether it and its kind simply sprang unnurtured from a chance seed of thought under the casual agencies of light and rain, and a strong wind, possibly, from the press.

One of my intimate friends was a writer, the only writer I ever knew intimately, and I used to wonder why he didn't get into the best-seller class. He wrote well, I judged; he wrote with indefatigable industry; he had kept at it, from very love, from his earliest youth. But after the lapse of more than twenty years I settled in my mind that he was destined forever to get more pleasure than profit from his life-work. Even at that, one could not count him a failure.

He engaged a West Indian to push him from Madison Square to 42nd Street.

He kept what he called a 'literary diary,' always open to my inspection, and when he was thirty-nine he made this entry (the date was September 22, 1909): 'I really believe I am striking oil in plotting on my sure-enough novel-to-be, which for the present I'll refer to as *Trix*.' But he always thought that about every new book, particularly just before the first words were written—that it would turn on a perfect gusher of an idea. Naturally I wouldn't try to discourage him; still, I considered him rather old for new tricks.

The story had been inspired by the photogravure section of a Sunday newspaper—the picture of a girl, smiling, a girl more impudent-looking than pretty. She called for an impudent name: there you got your *Trix*. To my friend the likeness suggested just the sort of character needed to cope with a complicated situation.

Five weeks later he wrote: 'I am on Chapter VII of *Trix*. I have been laughing over it. I wonder, will others laugh?' I realized that *my* laughing over his manuscript did not answer the question. The general public has a disconcerting way of 'screaming with laughter' over certain so-called humorous writers when it is impossible for me to derive from their works the faintest squeak of a laugh. *Trix* did not make me scream once; but I will admit a few chuckles.

A month later my friend wrote: 'I have been desperately busy with *Trix*, and now it's finished. My father and mother are disposed to be enthusiastic over it. In my opinion one must either like "Miss Trix" pretty well, or not at all.' Which was his way of saying (though he may not have realized this) that you must either be a wise man or a fool. For of course he thought, still warm from the glorious work of creation, that Trix was just about what any girl ought to be. Of course his parents thought so too. But perhaps they were afraid to show their approval too openly, remembering the thousand-and-one disappointments of the past. As for me, I soberly believed that the first publisher who had a chance at that manuscript would 'snap it up.'

To what publishing house should he first send the manuscript? Naturally to the one that had come nearest to accepting a former novel. After keeping a story of Northwest Missouri six weeks, this company had written: 'Your story is in many respects a captivating little romance and we hope you can see your way to make it a piece of work that we could publish. We are holding the manuscript here at this office waiting your decision.'

It took the author no longer than the time required to write a letter and get down to the village post office to call for the manuscript's return. It was rewritten and resubmitted. After due consideration the company again sent it back. 'There is too much dialect; it makes the story hard to read . . . We trust you will perform the revision in as short a time as you can con-

veniently do so.' The story, as soon as possible—too soon for perfect neatness—went back to New York. A delay of three months. Then word from the company that the story would have a better chance with their readers if retyped; they would pay half the cost of the typing—'But we cannot then promise acceptance of the story.' My friend agreed to pay his part. And six weeks later there came the decree: 'Our house does not believe it can make of this book a commercial success.' Also bill for typewriting.

It certainly did seem a close shave to fame! My friend argued that if the company had come that near to accepting the Missouri story, it should unreservedly accept *Trix*, in which Missouri was not mentioned. So the manuscript took the train for New York. It stopped at the company's hospitable quarters for a long time, a time long enough to see all the sights and be seen by all the publisher's readers. Christmas was near at hand when a letter came from the hosts of 'Miss Trix.' Now, my friend used to take his missives from publishers to an old-fashioned board fence near the post office, and there devour the contents, so that he might, on going home, break the news in the most agreeable manner to his parents, with whom he lived his bachelor life. He called it the 'Fence of Sighs.' Not, I think, that he made audible groan there, on catching sight of, 'We regret to say . . .' They were spiritual sighs that gave a melancholy association to the rendezvous with hope. My friend had received so many publishers' letters that he fancied he could tell by the feel of the envelope the gist of the inclosure. This particular letter was a thin one, whereby he thought he knew what it meant; and when he opened it, that cold December day, he himself almost as cold, he knew that he knew. Then came Christmas.

He started the New Year right, 'breathless but not heartless,' he remarked, by sending the manuscript to another house that had almost accepted a previous work. This firm, after being closeted with an earlier manuscript three months, had reported: 'Our publishing department is so encouraging that your story has been put in the hands of our chief literary adviser for final report.' This entrancing communication had been signed for the company by 'M. M. W.' Oh, M. M. W., where are you now? I could tell you how you raised my friend to the heights of bliss by those few lines, so high indeed that the fall was rather sickening when the manuscript hit the Fence of Sighs.

About this time I said, 'Why not try a firm you've never tackled? These old-timers may be a little skittish at the sight of your name. Perhaps they have begun to hate you from coming so near to falling in love.' My friend did not think this a good idea. But he thought it as good as any idea I had regarding literary markets, so he picked out a brand-new prospect. And when the days were fulfilled in which *Trix* was to be rejected, home it came.

'Look here,' I told my friend without ceremony—the privilege of friendship—'that child needs a new dress. No girl or manuscript can spend more than six months in New York without getting her clothes mussed.' He groaned, but he put in a new typewriter-ribbon and a fair portion of his life with it, and brought out *Trix* looking very smart indeed. Smart, that is, except for various words that he would misspell when thinking more about life than words. His father, a retired college-president, always went over his manuscripts to catch such lapses. 'I want to see this book published,' his father said, as he scraped away at ill-advised letters with his pearl-handled knife.

But he was never to see 'Miss Trix' spread her wings. She was still in that chrysalis of a manuscript when he laid aside knife and pen for the last time.

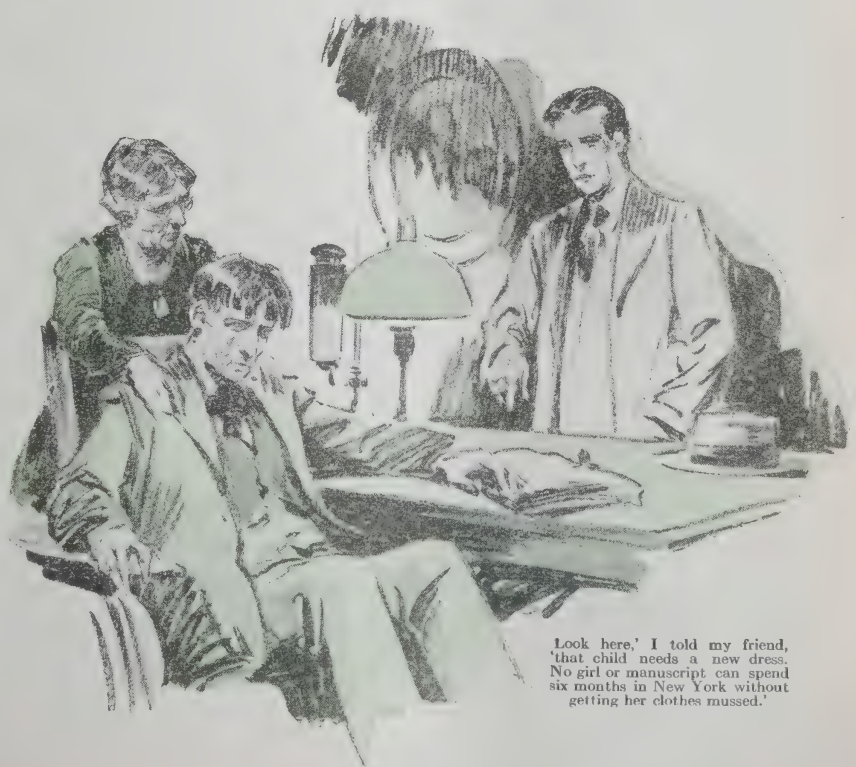
A few months after that a publisher liked *Trix* well enough to ask its author to the city for a conference. Also there were good words about our heroine, coming, as good words so often do, rather late. But how could he go to a strange city—he who could get about only in a wheel chair, who had not been able to walk since infancy? With his father it might have been managed; but not now. He had to refuse this conference which might have meant—

The literary editor replied that possibly he could 'get down' in February. Well, that was something; the manuscript had not been hurled at my friend's head. March blew itself out, April smiled through tears, May gave her annual tiptoe dance, and in June, what do you think happened? It happened to New York City. My friend struck it with his wheels and his mother, a lady far from strong and almost seventy. He put himself on the train not only to be whisked away to join his manuscript, but, among other things, to find change of scene for them both, and to consult a literary agent. This is what he wanted to know of the literary agent: Why didn't his manuscripts get published?

He engaged a West Indian to push him from Madison Square to 42nd Street, gaining an intimate knowledge of curbs on the way; and an elevator took him to the tenth story of a hotel where he paid ten dollars to the first agent he had ever seen.

'Your manuscript?'

'I brought none with me.'



'Obviously I cannot criticize your work unless it is in my hand,' she said, putting the money into her purse. In subsequent dealings with this stern-faced lady, he did not always think her in the right; but on this occasion the truth was obvious. So he sent for *Trix*, and several days later was again in her presence.

'You tell me you wrote this story,' she held it up, 'yet you live in a little town down in Arkansas! I can't understand it.'

'But most of my life has been spent in a small town in Missouri,' he protested.

'So much the worse! It's a miracle. How anybody in a little town could

*oncluded on page 18)*

Look here,' I told my friend, 'that child needs a new dress. No girl or manuscript can spend six months in New York without getting her clothes mussed.'

# What's the Matter With the Ministers?

## Do Our American Preachers Lack Conviction Concerning the Substance and Efficacy of Their Message?

By WILLIAM E. BARTON

THERE is no one thing the matter with all ministers excepting that they are human. They have no faults which other men do not also possess; neither are there any virtues that belong exclusively to them. They ought to be better than other men and on an average I believe they are. I know more than most men know about the faults of ministers, and they are many; but the more I know ministers and the more ministers I know, the more thoroughly I respect them. I hold in high honor the vocation which I entered in my youth and to which for forty years I have been proud to belong, but it would be a mistake to assume that ministers were disproportionately better than other good men. I will not say better than the average man, for we have a right to ask something more than that. I think we have no right to ask that the minister's goodness shall be out of all proportion to the goodness of other men.

Ministers are no more alike than other men. There are men of large ability and men of average ability and mediocre men and men who are ignorant and shallow in every one of the learned professions. It is as easy for a shallow and ignorant man to get into the ministry as to get into any other position where a leader should be wise and true, and once in, he is likely to find somewhere a church where he is either welcome or tolerated.

*The Days of the Prairie Preacher*

Nor do all such men do more harm than good. About 1850 old Governor Ford wrote a history of the State of Illinois, a rather remarkable work, and very pronounced in its opinions. It denounced Stephen A. Douglas and Abraham Lincoln with equal vigor as being politicians of no real merit, calling them both 'spared monuments of popular wrath.' Governor Ford wrote about the early preachers of the prairies. He said that most of them were ignorant men, but no one of them had difficulty in finding a congregation still more ignorant. That was a very wise remark. I sometimes think it is that fact alone which gives any of us courage to preach.

My worst fear about the ministry of the present time, or rather, I should say, a portion of the ministry, is that it has no compelling conviction concerning the content and efficacy of its own message.

I rarely hear anybody preach, the reason being that I am almost always preaching myself. Let me tell, by way of somewhat lengthy illustration, about the last two sermons I have heard. They were on the Sunday preceding Christmas, 1925. In the morning I was in a very interesting old American town, a place of fine tradition and hereditary culture. I attended one of the oldest churches in the United States. George Washington sat in its pews, and so did other Presidents down to and including Woodrow Wilson, but it was an old church in Washington's time. Kings and queens made gifts to it. There is a college in that town, one of the oldest in the United States, and the town was full of young life.

*A Sermon in an Old Church*

I counted about eighty persons present at the morning service on that Christmas Sunday, and having heard the sermon, I wondered that there were so many. The preacher was, I should think, between thirty-five and forty, a man who had been preaching long enough to develop his powers and define his message. He was a man of education and culture. He knew how to prepare a sermon according to homelitic rules. Not a single sentence in his discourse offended in any way either good taste or sound doctrine. He preached from the text, 'Let your moderation be known of all men; the Lord is at hand.'

Of the preacher's moderation the sermon was conclusive evidence, but it did not bring the Lord any closer to hand than He had been before. He said, and I have no fault to find with him, that the clause, 'the Lord is at hand,' might properly mean to us not quite the same that it meant in the Apostolic Age, and he rather mildly suggested that Christ was at hand waiting to become incarnate in human life here and now. That should have been his real message. He should have proclaimed that with vigor and persuasive power. Instead, that proposition was rather a colorless corollary. It came into the closing paragraph as a kind of placid inference. What would have happened if that truth had really gripped the heart of the preacher, and he had gone to the pulpit with that as his one real message? Suppose he had put all the rest of his sermon into the first three minutes by way of introduction, and then had proclaimed the larger Christmas of a Christ waiting to be born into the lives of men? Would the streets have been full of students, idling up and down and doing everything but attending church, or might he have packed that historic old edifice with eager young life thrilled and inspired by his message?

*Much Music; Not Too Much*

That preacher did not lack ability or training or scholarship or culture. He lacked conviction and power. That night I was in a large city not very far away and attended a service largely of Christmas carols sung by a large and well-drilled choir. The church was dignified and historic. I sat in a pew that was famous in history as having been occupied by a man of great prominence in the political life of the United States. The service had been well advertised and the house was as full as it might comfortably have been. There was much music and not too much, but the minister wisely and properly had reserved about fifteen minutes for his sermon.

DR. BARTON has been in the active ministry for forty years, beginning as a circuit rider in the Tennessee mountains. For over a quarter of a century he was pastor of one of the largest churches in Chicago. He has journeyed all over Europe, Egypt and the Holy Land, and recently has gone around the world. Because of his wide experience he is well qualified to write this article. You may not agree with all he says, but what he says is said calmly and honestly.

He had before him, as I judged, a crowd largely comprised of people who did not usually attend his Sunday night service. They were drawn there, in good part at least, by the attraction of the evening's music. There was his chance to deliver a message to people whom he seldom addressed, some of whom, perhaps, were rather infrequently at church.

His theme was the message of the Christmas carol. He had read somewhat concerning the history of carols. What he said was pleasing and, as far as I am aware, was accurate, but he had no message for that congregation. His little talk would have done quite as well at a five o'clock tea.

It had a value, to be sure, in giving a background for that form of music, and he said further, properly, that the carols were the unofficial, non-ecclesiastical music; that they did not originate in church choirs, but came spontaneously out of the life of the people. Their background was not the altar, but the hearth-side. So far, so good; but that was all.

*Analyzing the Carols*

If his little talk had any climax, it was to me a very disappointing one. He had gone somewhat into etymology and had found that various European languages had musical terms derived from the same root as our English word carol, and that in Italy the word so derived was applied to songs which constituted the vocal accompaniment of a country dance. This led him to say that Christmas has its legitimate secular joys as well as those that are religious, and that it is no part of the duty of religion to forbid those joys.

I agreed with him fully, and so do agree. Christmas comes down to us with varied associations, and those that belong to its domestic side are not to be forbidden in the name of those that are more distinctively ecclesiastical.

But assuming that he ought to have given virtually the whole of those fifteen minutes to an historical and musical analysis of the carols which I think he could have done adequately in half the time, he might at least in a single paragraph of not more than two minutes have put clearly before the mind of his congregation that these Christmas carols, however quaint and naïve their phraseology, do bring the singer and the hearer to the Christ. They follow the star and cause the singer to stand with the magi and the shepherds at the manger of Bethlehem. They do in fine exactly what that sermon did not do. They bring men to the Christ.

This preacher also was a young man of scholarly training, and I judged from his name and his ecclesiastical connection that he comes of rather fine old theological stock, but he let a thousand people go out of his church that night with no intimation that Christ had any legitimate place in Christmas. He erected a very attractive and rather cheerful inn vocal, with the melodies of the carols, but in that inn he did not provide even a manger for Him who gave us Christmas.

*There Was No Manger*

One swallow does not make a summer, nor do two Christless Christmas sermons constitute a ground for the indictment of a whole profession; but I wondered how generally, throughout the country, the sermons of that day had sounded any higher, clearer note. It was rather appalling to consider that intellectually these sermons were probably well above the average and that spiritually they might not have been very far below it. What was the matter with those two preachers? Not the lack of scholarship or culture or theological training or knowledge, but the lack of conviction that they had a message burning like a fire in their bones. There is a story concerning a minister who was spending a summer in remote rural New England and who was asked to preach in a little pastorless church on the following Sunday. He accepted, and he and his son walked a mile to the meetinghouse. The committee told him that they had no fund, and asked him if he would be satisfied with the collection. He cheerfully consented. The contribution box was in the vestibule and as the preacher went in, he deposited a half-dollar therein. After the service the box was unlocked, and he was given the contents, which proved to be his own half-dollar and no more. As they walked home together the boy said, 'Dad, you would have got more out of that box if you had put more into it.' The same is true of many ministers' sermons.

*Getting By with Sermons*

To my mind the sermon is to be judged by its lifting power. That is a good sermon which makes men want to be good and helps them in the effort, and reveals to them a power above themselves that will assist them in the attainment of goodness, but that does not always mean that a good sermon is one which has cost the preacher prolonged study or profound thought. It is far too easy for a minister to deceive his congregation and himself with a notion that he has preached a good sermon when, as a matter of fact, he has not done his best. One thing the matter with the ministry is that too many preachers are content to *get by* with their sermons; to preach discourses which their adoring hearers will call good, but which do not represent their own high thought and devotion.

I am about to say something which can easily be misunderstood, and which might be interpreted as a criticism on some men whose motives were of the highest and whose services were large. I do not so intend. During the war I was distressed to see the number of men who were eager to leave their pulpits and get overseas in various minor capacities of service. It was not that I did not sympathize with their desire to do everything possible for our soldier boys and to minister to them in even the humblest of capacities. I myself, by wearisome visits to camp and cantonment, did what I thought and still think my full share of this; but I could not help feeling that some men welcomed the opportunity to flee from the drudgery of the home church, taking ship for Tarshish like Jonah instead of settling down to the solid constructive work of the parish and maintaining in that crisis the leadership of church and community life.

*Ministers Become Discouraged*

I feel confident that some of the men who were peddling cigarets in France might better have been devoting themselves to the laborious and inconspicuous but important work of maintaining the home church. I do not wish to say this in a censorious spirit, but to me there were evidences that many men did not highly value the opportunity which then presented itself in the churches they had been called to serve nor feel the thrilling importance of their own message in such a time as that.

Another thing the matter with the preacher is that many ministers have become discouraged about their evening congregations especially and no longer seek to make them a means of converting men or even of edifying them, but chiefly of entertaining them.

I am no advocate of, nor apologist for, dull preaching. I rather admire a certain preacher, a friend of mine, who boldly announces in his Sunday advertisement, 'We defy any theater to be more interesting than our service.' That man makes his service interesting and also evangelistic. There is no reason why it should not be so.

# The Voyage of the Victoria

## PATAGONIA

*Sixth of a Series*

Taking advantage of a native's innocence and giving a playing card for six fowls.

BY CHARLES J. FINGER

WOODCUTS BY PAUL HONORÉ

WHEN the fleet sighted the Brazilian coast in the early part of December, 1519, a man who had been a mere cog in the machine rose to importance. That was Joao Carvalho, the pilot, an adventurer, a man who had done and seen strange things. More, he had been that way before, had lived in Brazil for three or four years and taken a native woman to wife. By her he had a son; Carvalho found him while the fleet lay there, and shipped him as a sailor. With whom Carvalho had sailed is not clear. It may have been with Pinzon, or with Cabral, or with Juan Diaz de Solis; or he may have been with some other expedition sent out by the commercial houses. For while Solis certainly cruised far south in 1515, and left his bones in the River Plate country, we are told by the historian Varnhagen that a Nuno Manuel was there before him.

Another historian, Manuel Telles, is of the opinion that a Diego Garcia first entered the Plate in 1512. But whoever it was that Carvalho sailed with, he knew his landmarks and recognized every promontory and headland, and knew submerged points and shoals well enough. Not only that, but he improved upon his credit by drawing on his imagination and telling all hearers of the wonders they might expect, such as natives who were cannibals, strange beasts that roamed in the forests, natives who used swift boats called *canoe*, people who slept in nets of cotton which were slung to trees and called *amache*, precious stones to be had for the picking up, bowls full of gold ready to be exchanged for a handful of beads—false and true were mixed up, and the credulous Pigafetta recorded all.

On December 13, 1519, the fleet dropped anchor in what is now Rio de Janeiro Harbor, a gulf almost landlocked, twenty miles long and ten miles wide, approached through a channel less than a mile in width. About the bay Pigafetta has much to say, and it must have been as a paradise to the men so long cooped up in narrow quarters in all that accumulation of filth, for that which immediately strikes the eye is the intense coloring of dark blue of sea and sky. Then the richly wooded hills, the inverted world seen in the waters, the vivid spots of color, the slender track of yellow sand with its silver edge where water touches land, the trees against the turquoise sky that look like burnished gold as the setting sun strikes them, the lofty Corcovado, the starry wonder at night, the extraordinary size and magnificence of the flowers, the glorious and brilliant birds and butterflies, the lights and shadows on the cascade of living green. The march of improvement had not robbed the place of its beauty four hundred years after Magellan's visit, and it must have appealed to his sailors as a vast, luxuriant garden.

The fleet stayed there for two weeks, taking in wood and water and provisions. In the midst of all that wonder and beauty the social machinery ran smoothly and light-heartedness seemed to be the chief aim.

Now and then masses were held ashore, and the natives attended, 'remaining on their knees with their hands joined so that it was a pleasure and a pity to see them,' says Pigafetta. That the forms of ritual were merely imitated in exactly the same spirit with which on other occasions the white men imitated the signs and the gestures of natives, did not occur to the chronicler. What the worthy man beheld, or thought that he beheld, was primitive man going through peculiar psychological processes and standing regretfully, as it were, at the entrance of some arcanum which he could not hope to enter. For in Pigafetta's view, an awful and eternal doom which they could in no wise escape awaited those children of nature. So 'it was a pity to see them' going through forms which for the white men were efficacious, but which for the savage for whom there was no possible mitigation of harsh destiny were mere gestures availing nothing. But Pigafetta's ideas of rights and wrongs did not prevent him from taking advantage of a native's innocence and giving a playing card for six fowls. He was ready for his share of the spoil at any time.

The fleet left the day after Christmas, and on January 11, 1520, rode into the reddish brown waters of the River Plate, then known as El Rio de Solis. Carvalho had been there before, or else he had been intimately acquainted with someone who had, for he recognized this cape and that. No sooner had the first dawn after anchorage broke, than some of the ships lifted anchor, Magellan going south in the *San Antonio*, the little *Santiago* sailing upstream, and it was fifteen days before the ships gathered together again. It must be realized that from the point where the fleet anchored, the estuary runs up into the land for a distance of two hundred miles, with a breadth of thirty miles or more, and the long stretch is formed by the union of the mighty River Uruguay with the still greater Parana, two rivers which, between them, drain almost a fourth of the South American continent. Magellan's idea was to discover whether the body of water was not the sought-for strait.

The men of the *Santiago* saw natives. Some writers, quoting others who wrote from supposition, have said that the

sailors were full of fear lest the cannibals who killed and ate the explorer Solis should attack the men of the *Santiago*. So it has been a kind of inculcated belief that the Charruas were man-eaters. There is no proof that Solis was eaten. He lost his life in 1516, while trying to capture a native to carry back to the king of Spain, and the natives resented the invasive act.

That the Charruas were not cannibals seems to be proved by the fact that in 1527 Sebastian Cabot found three of the men who had been with Solis at the time of his death, and they were living peacefully with the natives. Cabot gives their names as Melchor Ramirez, Enrique Montes and Francisco del Puerto. If the natives were given to the eating of the flesh of their enemies it is strange that they refrained from eating their three captives as well as Solis.

We pass over as unimportant much that Pigafetta records in the way of St. Elmo's fire, fearful storms, and the running of ships upon shoals. He has been quoted and requoted about other things that seem too childish for remark, as that the savages, being pursued, 'made such enormous strides that with all our running and jumping we could not overtake them' —for a moment's thought should be sufficient to show any thoughtful man that no dressed and booted sailor could by any possibility hope to overtake a native on his native soil, unencumbered and swift of foot.

The matter of diminished rations also calls for remark. Certainly the rations were diminished, although the adjacent country abounded in game and fish, and still so abounds. Readers of W. H. Hudson know that well enough. I might add my own testimony, that I have gone for days on end with nothing more than a shotgun and always found ample food. But the explanation seems to be that the sailors were terribly afraid of unknown and nonexistent dangers, conjured up by their own imaginations.

They were afraid of giants. They were afraid of cannibals. They were afraid of 'sea wolves,' which are nothing but fur-seals, as gentle and as harmless as sheep. As to that last, Pigafetta has a passage telling how, when the fleet was in Bahia de los Patas, in the month of February, a boat with six men was sent ashore for wood and water. But so fearful were the sailors of natives that instead of rowing to the mainland they went to a small island, keeping it between themselves and the ships, and there landed, unseen by their shipmates. That action could have been nothing more than the result of fear, for the island is nothing but a low-lying piece of land, quite timberless and obviously without water. But there they stayed all night, full of fear lest they 'be devoured by sea wolves' or perish with cold, until they were found the next morning by their shipmates.

There were many similar cases of fear, though, to be sure, the men are not to be condemned for poltroonery because of that. They could, and did, meet danger and suffering at sea, but when it came to land, matters were different. Like children who fear to go into the dark, they had excited their own imaginations and were prostrated with terror in places where, had they knowledge, they might have known they could walk unscathed.

The spokesman was a *grumete* or ordinary seaman.

On March 31, 1520, the fleet reached St. Julian Bay, in latitude 49° 20′ South, and there Magallen decided to winter and make repairs to his ships. In view of what occurred there it is well to understand that it is a stretch of water almost landlocked, of no great size, with a couple of islets in it and a small fresh-water stream running into it. It is not surrounded by desert country, but grassland which today gives sustenance to sheep and cattle. Directly west of the southern part of it are highlands culminating in Mount Sholl, from which may be seen something of the River Santa Cruz, a little south of west.

For a few days there was great activity, preparing for the winter, but when it became generally known that the fleet would stay there until the spring, and when it was reported, falsely, that the winters were terrible in their intensity, a deputation, or a kind of grievance committee, as we would call it, waited on Magellan. He heard and considered the complaint, which had to do with the short rations, made answer with sturdy manliness and without any evidence of that lawless self-will of his, pointing out that there were fish in plenty to be had, and things seemed to go smoothly.

Soon came another protest, mentioned almost casually by the chronicler, but in a way that seems to indicate that he considered it wiser at the time of writing to leave much unsaid. Some historians have made much of the thing, writing of eloquent outpourings and brilliant speeches, at the end of which the objectors, dazzled and delighted with all that rhetoric, retired. But it is the experience of every man who has had authority that genuine workmen are rarely loquacious.

Instead of dramatic and picturesque situations, what is reasonable to picture is something like this. The deputation of toil-worn, hard-handed, mahogany-faced men, some with rags that would hardly hold together, loosely grouped on the deck of the *Trinidad*. The majority of them would be ill at ease, as subordinates usually

are when fronting authority, but there would be one or two with an air of quiet determination.

I get that picture from the life, for on the same coast, on board a barquentine on which I sailed before the mast, a happening almost identical took place. But instead of attentive officers and captain, as in that case, we imagine a Spanish captain or two, tall and comely, on the edge of things, brilliant and splendid in corselet and helmet donned for the occasion. Then we see Magellan, a frowning man of less than medium height, swarthy and bearded, square-built and walking with a limp. Behind him would stand a few pike men, and his cousin, and the rascally constable, Espinosa. As background to the picture there would be the gray and featureless land dotted with tufts of high grass and stumpy thorn bushes, a land trackless and treeless, looking infinitely desolate to men who remembered the River Plate and the Brazilian harbor. Add to all that the gray-green water of the bay, the yellow sand shoals, the two gloomy little islands and the white, wheeling, screaming sea gulls.

The gray-green water of the bay . . . and the white, wheeling, screaming sea gulls.

The spokesman was a *grumete* or ordinary seaman. He and his fellows wanted the restoration of full rations and, if they were to winter anywhere on that coast, to do so farther north where conditions were less severe. They had labored long and hard. They had suffered from storm and stress in dreadful misery. Let something be done for their comfort and the admiral would find them laboring cheerfully. As for him, he was no ringleader, but one chosen by lot, an outspoken man. And surely the captain-general would agree that it was better to declaim openly against wrongs to those with power to mend them, than it was to nurse them secretly.

As the man talked, Magellan paced to and fro, frowning and angry. Then he stopped short and looked at the sailor for a moment, after which his questions came swiftly. He wanted to know who was back of all this discontent. Who was it that challenged his authority? He wanted names.

At that the sailor effaced himself promptly, for revelation of names was a dangerous business where so much was whispered and hinted and where there were so many commanders. Also there was a tendency in the protesting group of sailors to dwindle away, none standing forth prominently, though there was some indefinite pushing and thrusting in the mass in the effort to produce a new spokesman. Then from the crowd there was a noise of grumbling voices, nothing very intelligible, merely half-spoken sentences fitfully audible. Then an embittered word or two was flung. Soon there were shoutings from undetected voices. One flung out a demand for a return to Spain, another shouted the word, 'Traitor!'

Immediately the balance was destroyed. The deputation had passed beyond a mere parade of wrongs and had crossed the line into a danger zone. Magellan gave the word, and into the unarmed crowd of sailors ran Espinosa and the pike men, beating, thrusting, seizing this one and that, and then authority was used unsparingly and untiringly. The whip, the chain, the stocks, the prison cell—these became weapons, and a half-dozen, who had not in the least dreamed that their presence would involve responsibility, were forced to endure much.

But, after all, it was only a play of pawn against pawn, with none of the major pieces engaged. That greater play was to come, a terrible play that left a monument in the gallows and human bones which Drake saw a few years later on the shores of St. Julian Bay.

## An Intimate Story of a Best Seller

(*Concluded from page 13*)

have such breadth of vision is—it's a miracle. You are how old?' He was forty-one. 'And you've never been to New York before? It's a miracle. This story is sure to be taken.'

'But the publishers say people are not interested in village life,' he murmured deprecatingly, 'and *Trix* is a story of a small town.'

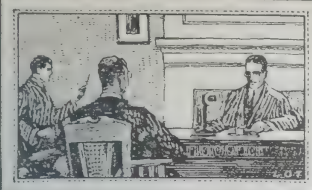
'They don't know what they're talking about. But of course this manuscript will have to be done over. My fee for that is $20. It won't do as it is, because publishers want the phraseology more exact. For instance, on this first page, the girl knocks at a door. You say, "At first, no one answered." Why don't you say, "Nobody answered"? Or, to shorten it, why not say, "There was no answer"? or simply, "No answer"?'

'I don't know,' my friend admitted feebly.

'But you must know. You must know why you do everything that you do.' When my friend parted from the agent, it seemed to him that he knew nothing with absolute exactitude except the sum of money that had changed hands. Had he been able to walk like anybody else, such was his weakness and abject humility that he would have needed that West Indian anyhow.

Meanwhile a message had come from the publishing house. They had sent him the manuscript of *Trix* at his request, but they still claimed the right to publish it—the first hint that they had decided to do so. But, in fact, they had not decided. Even after my friend visited the head of the firm, even after the notable conference took place, the issue was only a probability. My friend and his mother were generously entertained by the firm at a delightful hotel; but after they arrived back in Arkansas four months passed, with several visits to the Fence of Sighs, before the contract arrived.

And five months after that came the formal presentation, the Day of Publication.



And then, a few months later, *Trix*, garbed in a splendid jacket and blossoming under another name, equally short and impudent, headed the list of best sellers.

(I have not given the author's name, nor the publisher's, nor even the final name of the book—but the story of *Trix* is true.)

*A LOT of people are advocating the revival of the whipping post as a punishment for crime. Delaware retains the whipping post and next week Aaron Hardy Ulm will tell just how it works out.*

*Our next issue will also carry another of those intimate articles on China by Inez Marks Lowdermilk, and Dr. William Barton will deal with the education of the ministry in its relation to our children.*

*Burt McConnell, an authority on Polar exploration, will relate the tragedy of the Franklin Expedition.*

# CHATS WITH OFFICE CALLERS

'They think it is the farmers who are doing it,' said ***the Man from Iowa,*** as he discussed recent political events of his state.

'They'll be telling the President that it is the delay in the proposed farm legislation that is the trouble.

'Worse than all, the President is likely to believe it, and take advice of his narrow parochial advisers, and rush through some alleged farm legislation.

'But they won't fool the Iowa farmer—not for a minute. He knows that laws passed that way are not passed for his benefit but for his *vote*. The President's advisers think of the farmers as votes. And if the President himself gets to thinking of them that way, he has lost them for good. The safest thing for the President to do is to get thinking about the farmer's benefit as a citizen, not as a voter. The farmer has been a voter too long; he wants to be a fellow-citizen in the real sense.

'You want to know what's wrong in Iowa? Well, it's just this. People feel that Washington isn't quite as United Statesy as it ought to be. Iowa felt that Washington felt that it was quite a privilege to be a kind of appendage off at one side of the country, but the core of the country is New York and Washington. That don't go out in Iowa, I tell *you*. Our old regular senators got thinking the same way—they lived and thought Washington and forgot Iowa. Why, what did they do about the World Court? Did they come back to us and say, "Folks, how do you feel about it?" No! They just slammed us in without consent, because Washington wanted them to do it. Instead of asking us how we felt about it they started in to tell us how we should feel about it.

'You can't do that long with the people out our way. We're too United Statesy. When it comes to the United States against a tidewater crowd of politicians, I guess United States will win.'

ɾ ɾ ɾ

'The French people do not understand America,' said ***the famous French war ace,*** 'because they are misled by their newspapers and politicians. In the first place you must know that the average European has no true conception of America; to him it is a land where wealth and prosperity abound. He gains his idea of *all* Americans from those rich tourists who scatter money to the four winds. He is frugal himself and this prodigality to him seems like generosity. And so he looks for generosity from the American nation. He feels that generosity would cost the American little because he has so much.

'The newspapers and politicians cater to this belief. The editors—like some of your own—publish, not the truth, but what they think their readers want to believe. They exaggerate America's wealth and declare that America could help France with little inconvenience to herself. They recall what France has done for America in the past, and stress the 150 years of close friendship between the two nations. Certain politicians in their effort to get votes make absurd promises; they guarantee to get aid from America if they are elected. And when this aid fails to materialize the French people are disappointed. They cannot understand America's position.'

ɾ ɾ ɾ

'It was not always excellent taste on the part of our early printers that made their books beautiful,' said ***one of the country's leading typographers.*** 'Much of the beauty of the old books is in the sparing use of different type faces. Often the printer had but one or two in his shop, and consequently couldn't go wrong. It was impossible for him to experiment like many printers have done since the beginning of the metal type foundries and their multiplicity of type faces. We are passing that stage now, however, and the tendency is back toward the simplicity of three hundred years ago. One of the biggest helps in my work has been a collection of early books not rare in themselves but good examples of early printing. Such a collection any printer could make at no great expense of time or money and it would be a constant guide and inspiration for better work in his shop.'

ɾ ɾ ɾ

The ***Engineer*** and ***Musician*** were lingering at the table over an after-dinner cigaret.

'What are your honest opinions regarding cigaret smoking,' we asked.

Each looked at the other. Then the Musician burst forth with a two-word confession.

'No good.

'When I was playing three concerts daily in Boston, I found that if I expected to do my best work in the heavy number on the evening program I must leave cigarets alone before the performance.'

'My experience,' said the Engineer, 'has been somewhat similar. If a job comes along which requires a long period of concentration or exceptional mental effort I have to lay off cigarets. I find that my mind is more keen and alert without them.'

Both men agreed, however, that under nervous strain the cigaret had a quieting effect upon them, which may explain why the use of cigarets is increasing in present times.

ɾ ɾ ɾ

'Most of the movie magnates are really *trying* to be artistic,' said the ***Noted Editor,*** just back from Hollywood, 'because now they realize that artistry pays. And of course *that* is what counts with them. Many of the plain ignoramuses are gone; they have made their money and got out. Those who are left are shrewd fellows who have grown with the industry. As they acquired wealth they also acquired a smattering of general knowledge. And they have brains enough to realize what they lack in culture and breeding—and so they try to hire it from others. Their fallacy, of course, is that culture can be bought by the yard measure. That is why there are still so many glaring inconsistencies in the films.'

'The most valuable voter, potentially,' said ***the Secretary of the Board of Election Commissioners,*** 'is the stay-at-home voter.'

'Why the stay-at-home voter?' we asked.

'Because he has no axes to grind. In spite of the fact that he shows an apparent lack of interest in the welfare of his community, still you will usually find him to be a pretty substantial sort of citizen. Very often he's the fellow who asks you: what's the use? He hides behind the futility excuse.'

'What can be done to cure him?' we asked.

'Well, figures show that participation in our elections is dwindling right along. To arouse public sentiment and get votes out we must change the mechanics of our elections to catch the votes where they are. You see, they have tried *compulsory voting* but never *convenient voting*. The "Get Out the Vote" movement seldom shows results. Folks are fed up with complaints about the lack of participation in our Government. This may not be entirely due to their lack of interest but rather to our antiquated and inconvenient election system. It is an echo of the old town meeting days.'

'Well, what's the answer?' we demanded.

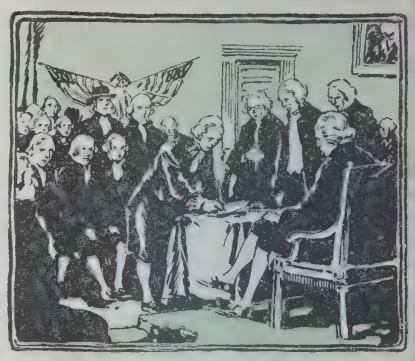
'Give the voter more time to think over his ballot—let him vote by mail.'

'But think of the opportunity for crookedness,' we ventured.

'No more than at the present time,' declared the Secretary. 'Not so much, in fact, for you would have all this stay-at-home vote to stabilize the ballot box. Every vote can be carefully checked. Of course, such a movement would have to be introduced gradually and the people educated up to it. But voting by mail is the coming thing.'

And maybe it is.

ɾ ɾ ɾ



'You Americans,' said ***Our European Visitor,*** 'are so remarkable in so many ways, that one of your characteristics strikes me very forcibly as showing a weakness somewhere. That is the sparcity of general ideas in your conversation. You talk a great deal, but there is no conversation, no exchange of ideas. The talk usually turns to things or to their acquisition. I seldom hear so much as a fleeting reference to a general idea. Discussion is confined to the particular and personal, to machines, to clothes, to the theater or movie.

'You people seem to have trained yourselves to a severe system of specialization. Each man has his sphere, and he doesn't or daren't step out of it. In his specialty, however, he is a two-edged sword.

'As a result, conversation is nil. A mixed company has nothing in common unless it be on the trivial side of life. You play cards or sing Irving Berlin's songs together. These seem to be the only points at which you can contact each other conversationally. I mention it, not in criticism, but because it has made so great an impression on me.'

# The Fighting Quaker Who Made Cannon

## Rhode Island and South Carolina Signers Included Hopkins, Outlawed by His Co-Religionists

By CARL SCHURZ LOWDEN

BACK in 1776 Rhode Island was, as it is now, the tiniest among the original thirteen states. It measured thirty-five miles in its extreme breadth and fifty in its greatest length. Delaware, ranking second in area as it does now, was just about double the size of 'Little Rhody.' The least state sent the fewest representatives to Congress, and had only two signers of the Declaration of Independence. Stephen Hopkins and William Ellery most ably attended to its interests. Both were indomitable patriots, religious, worthy citizens and relentless foes of slavery; each was an expert penman. But Ellery was rather irritable in temper, of moderate stature and not fond of bodily activity; Hopkins was calm, tall, and liked outdoor life. Ellery, the Harvard graduate, practiced law; Hopkins, who had obtained his education in the old-fashioned log schoolhouse, as many boys had, had been a dirt farmer. The Harvard man read Cicero as a pastime.

Though both of the Rhode Island delegates were legible writers, Hopkins' signature to the 'Magna Charta' of American rights was the most illegible of them all while Ellery's consistently qualified as the best. Why? There was a reason. It was not fear that produced Hopkins' shaky handwriting.

'My hand trembles,' said Hopkins as he signed the Declaration with evident satisfaction, 'but my heart does not.'

Sixty-nine years rested on the frame of this Rhode Islander. He suffered from a nervous affection known then as 'shaking palsy.' When he affixed his name he steadied his right hand with his left, but the hand with the pen trembled anyhow. He usually had his secretary, Moses Brown, of Providence, to do his correspondence; but Brown was absent on this occasion. One cannot always judge by appearances; Hopkins possessed a willing and courageous spirit though the flesh was weak.

'Powder and ball will decide this question,' he declared during the debate on the proposition that had been put before Congress to make armed resistance. These do not sound like the words of a faltering coward, and they certainly are not.

At Albany, New York, in 1754, Stephen Hopkins formed a warm friendship with Benjamin Franklin. He warmly supported the latter's scheme for the union of the colonies, but nothing came of it at that time.

In 1762 he founded the *Providence Gazette & County Journal* to counteract the influence of the loyalist *Mercury*. For twenty-three years he furnished the bulk of his newspaper's contents. Hopkins was an active, energetic man; also a powerful and lucid speaker. He could write forcefully, too.

In June, 1774, the assembly of Rhode Island passed an act prohibiting the importation of negroes into the colony. This legislation was mainly due to his exertions. In 1773 he had emancipated most of his own slaves; because he refused to free all of them his membership in the Quaker society was canceled and his name dropped from the roll. Even after this incident Hopkins continued to call himself a Friend. He kept on worshiping with the Quakers, but he professed religious views so broad that his enemies did not hesitate to designate him an infidel.

I think it can be justly said that Hopkins was the first abolitionist of America. Certainly he was a fighting Quaker, if such an anomaly is possible, using his influence in Congress in favor of decisive measures. But he did not stop with his influence. No, he manufactured pig iron, and from that he made cannon for the United States forts and troops. So I am not surprised that the Quakers outlawed him, as he really was a Quaker in name only.

Simultaneously he held membership in the Rhode Island legislature, in Congress and discharged the duties of chief justice. He was a member of the first two committees appointed by Congress. His extensive knowledge of the business of shipping made him particularly useful in Congress as a member of the naval committee in devising plans for fitting out armed vessels and furnishing the colonies with a naval armament. He was one of the fathers of the Navy.

During eleven years Stephen Hopkins was the governor of the province. In 1758 party dissension had developed through the rival candidacies of Hopkins and Samuel Ward, a young man then only thirty-three. The older of the two commented upon a pamphlet issued by the other. He lamented the 'strange forwardness of so young a man as Mr. Ward, without knowledge or experience in the affairs of government, to endeavor to place himself at the head of things, and still more strange to attempt to render himself qualified for so high a post only by blasting another man's reputation, without displaying any ability for governing or any other amiable quality in himself.'

Several years afterward Stephen Hopkins and Samuel Ward occupied seats in Congress as colleagues. Rhode Island had sent them there. Circumstances had brought these two patriotic men together; though once rank enemies, they had become warm friends. The tragedy or drama of it all lay in the circumstance that they would have been brother signers of the Declaration of Independence if Ward had not died and been replaced.

William Ellery, the Harvard graduate, was the man who succeeded Ward. This Rhode Islander spoke of the signing as an event 'which many regarded with awe, some with uncertainty, but none with fear.' He evinced a strong curiosity, almost morbid in its nature, to observe the emotions of the delegates as they wielded the pen. Those were highly dramatic moments on that warm second day of August.

'I watched every one sign,' Ellery narrated afterward, 'as I was determined to see how they looked as they gave their names to what might be their death warrant. I placed myself beside the secretary, Charles Thompson, and eyed each closely as he affixed his name to the document. There was undaunted resolution in every countenance.'

He was a member of eight or ten committees in Congress; perhaps none exceeded the marine committee in importance. It recommended the plan, supposedly at his suggestion, of preparing fire ships to be sent out from the State of Rhode Island.

About that time or a little later the

enemy succeeded in blockading the American squadron, commanded by Esek Hopkins, in Blackstone River.

The fine home of Ellery at Newport was burned by the enemy and his personal treasures destroyed or stolen. The residents sustained much injury to their property with General Piggot in possession of the city, fortifying it and using it as his headquarters. War is no respecter of homes or persons; that fact was driven into the consciousness of the patriots.

But through it all William Ellery could be truly hilarious. During the winter of 1779-80 a committee of Congress was sent to Washington's headquarters to confer with the commander-in-chief. The members were a Mr. Mathews, of South Carolina, a Mr. Peabody, of New Hampshire, and General Peter Schuyler, of New York. At that time James Madison, who later became President of the United States, had been in Congress only a few months. He joined with Ellery in sending the following quite informal letter to the absent three delegates:

'Ye poor devils shivering on the bleak hills of Morris, how we pity you! Ho, soldier, with your canteen; view that poor committeeman, see him trembling! Hark! Hear his teeth chatter—unable to support himself under the chilling blasts which, unclothed and unfed, you have endured with invincible perseverance and fortitude. Soldier, see him expiring! He was nursed under a fervid sun, and he exposes himself to your nipping gales to bring you some relief.

'We addressed Congress and used every argument in our power to induce them to order a couple of pipes to be sent to headquarters, and we told them that the general's wine was entirely exhausted. They doubted. However, we shall for once stretch our power and send forward two pipes immediately. You will be pleased to consider soberly the business you have undertaken and the expectations of your Congress, and not drink more than three glasses of wine at dinner and six at supper. And whenever you write to us, do it before breakfast.'

It is hard to believe that either Madison or Ellery could have penned such a fun-poking communication; yet Ellery, although a Harvard man and a lawyer with enough dignity for the profession, owned a mind that kept pace with the world.

In 1785 the matter of slavery was brought to the attention of Congress by Rufus King who desired to make it unlawful throughout the country. Ellery ably seconded and supported the resolution 'that there shall be neither slavery nor involuntary servitude in any of the states.' The measure was defeated.

The slavery issue decided, Mr. Ellery retired from Congress at the end of the year. He later became a commissioner of the continental loan office and next chief justice of the superior court. On the organization of the Federal Government, President Washington appointed him collector of the customs for the town of Newport, a position which he retained during the remainder of his life.

To Charles Carroll went the double distinction of reaching the greatest age of any of the signers and of living the longest after the making of the immortal document.

Ellery displayed an uncommon disregard for the applause of mankind. He was strongly individual with an Emersonian touch in his acts and writings long before Emerson had been born. I shall quote the following two cogent observations as evidence of this characteristic:

'Humility, rather than pride, becomes such creatures as we are.'

'He that loveth father or mother, or he that loveth son or daughter, more than liberty is not truly worthy of her.'

The signer's dream of abolition of slavery failed. But his nephew and namesake, William Ellery Channing, vigorously espoused the cause in the period preceding the Civil War and probably did more than any other man, Lincoln excepted, to make it a reality. So 'Uncle Bill' won by proxy, as it were.

---

## SOUTH CAROLINA

The youngest signer for South Carolina was Edward Rutledge, age twenty-six years. The most surprising fact is not that Rutledge was the youngest endorser of our great document; for even more startling, it seems to me, is the circumstance that he had a compatriot who was also under twenty-seven on the second day of August, 1776. This man was Thomas Lynch, who, however, had a birthday anniversary just three days afterward. As the other South Carolina signers, Thomas Heyward, Jr., and Arthur Middleton, were thirty and thirty-three respectively, youth was truly in the saddle in that state.

There are some other facts that differentiate the South Carolina signers from the other backers of the Declaration. All four were lawyers, and all four were natives of the state they represented; they shared this latter distinction, however, with Maryland, Virginia and Massachusetts. Their span of life averaged forty-seven years; they constituted the youngest group affixing their signatures on that oppressively warm second of August, 1776.

The name of Rutledge has never been eclipsed in South Carolina history. Somehow I can never think of it without recalling that Lincoln's sweetheart bore it. There were two brothers, Edward and John; the latter was an active patriot but not a signer. He became governor of the state, then a chief justice therein and later a judge in the United States Supreme Court.

At the siege of Charleston he was captured and imprisoned by the enemy in St. Augustine. His release was soon effected, however, and he returned to South Carolina in time to succeed his brother John as its governor. Long live the illustrious memory of Edward and John Rutledge.

During the war Rutledge was appointed along with John Adams, of Massachusetts, and Franklin, of Pennsylvania, to meet the British commander, Lord Howe, who had requested that an effort be made to negotiate peace and stop the fighting. Though the conference produced no beneficial result, it did bring the youngest and the oldest of the future signers together and led to a bit of drama enacted by them and the enemy. When the parley broke up, Lord Howe had our commissioners taken from Long Island to New York on his own barge. Just before reaching the shore, Franklin thrust one of his hands in a pocket and noisily clinked some gold and silver coins. At the time of the landing he offered the coins to the sailors who had rowed the boat; but the British commander would not let the men accept the proffered money. Franklin chuckled.

'Why,' Edward Rutledge wanted to know as soon as the commissioners were too far away to be heard by the enemy, 'did you offer money to the sailors, Doctor?'

'Well,' the aged Franklin answered, 'the British think that we have no hard money in the colonies, and I took this opportunity to show them to the contrary. I risked nothing whatever, for I felt sure that the men would not be permitted to accept my coins.'

Rutledge was again appointed to Congress in 1779, but illness compelled him to return home after he had arrived at the seat of government. Upon recovering from the disease that afflicted him, he took a leading part in the military movements in his state. Later in this same year he landed at Port Royal Island with a party of regular troops to dislodge the enemy. Rutledge had charge of a company of artillery; Thomas Heyward, also a signer, commanded another. It was necessary to call out a draft of militia, however, in order to drive the British from the island.

Later the youngest signer was taken prisoner. He suffered severely along with other 'dangerous rebels.'

Slavery was considered by Rutledge an evil that the English had imposed upon the colonies. He would never give his consent to increasing or extending it; upon this point he maintained an inflexible attitude.

He zealously advocated the adoption of the Federal Constitution. He took an active part in the state legislature; during his seventeen years there no measure of importance was passed without his interested participation in the discussion or debating.

It was said of Rutledge that 'for the good he did and the evil he prevented, his memory will long be respected by his countrymen.' And today there stands at Charleston a monument that bears a long Latin epitaph extolling his virtues and saying nothing about the few faults that he had.

All of the South Carolina signers were roughly handled in one way or another. Lynch was lost at sea; Rutledge, Heyward, and Middleton all formed an acquaintance with the enemy's jails or prison pens.

'He went with the army,' it is recorded of Middleton, 'to the defense of Charleston. He left his own property and plantations exposed to the enemy, and sent word to Mrs. Middleton to move with the family to the house of a friend a day's journey away. Middleton

suffered immensely. The buildings of his place were spared, but nearly everything was rifled; of valuable paintings too large for removal many were wantonly mutilated. Although not an officer, he fought with the forces at Charleston and was taken prisoner. He was deported along with others to St. Augustine and there subjected to humiliation by the official command.'

After a time Middleton was exchanged. He went home, then resumed his duties as a representative in Congress. The oppressive measures of Lord Cornwallis had so roiled the patriot and the horrors he had seen had been so revolting that he straightway proposed summary action. He submitted to Congress a motion 'that Lord Cornwallis should be regarded in the light of a barbarian who had violated all the rules of civilized warfare.'

The wreck of Middleton's property and fortune, the burning of scores of old Flemish and Italian paintings, the mistreatment of himself and the detention of his family made him all the more enthusiastic and ardent for independence.

He died on New Year's Day, 1787, while living in philosophical ease at his country-seat near the city of Charleston. He enjoyed his excellent library and the many friends who partook of his hospitality. Seized with intermittent fever in November, he refused the usual remedies with the explanation that 'it is best to leave nature to itself.' He gave his consent too late to his family's desire for a physician to attend him.

*Lynch the Undaunted*

The life of Thomas Lynch, the signer, is an illustration of the willing spirit and the weak body. After organizing the first South Carolina regiment of provincial regulars, he received command of a company. He started with his men on a march to Charleston, but unfortunately was attacked by a bilious fever. This disease slackened its virulence at times, but it never released its hold upon him.

Lynch rejoined the regiment; his poor health, however, prevented him from attending to his duties as he wished. Suddenly he received word that his father, who had taken his place in Congress at Philadelphia, was seriously ill. He prepared to go to his dying parent and bring to him during his final moments the solace of an affectionate son. He applied for a furlough, and was amazed to find the privilege denied him. Colonel Gadsden, the commanding officer, had certain inflexible rules and one of them was never to permit private life to interfere with his country's cause. Lynch had to remain, or be tried by a court-martial on a charge of insubordination. What could he do? He had found himself in an impossible situation. Fortunately, word soon came that he had been elected to Congress to succeed his sick father. The way was now open for his departure. He hurried to Philadelphia, went to his father's bedside and so cheered him that the aged man soon improved.

In the meantime the health of the younger Lynch had declined, due to the exposures suffered in the hurried trip from South Carolina. He managed to serve in Congress, however, until he had voted for the independence measure and signed the document approximately a month later. He then set out for his native state with his father; but upon reaching Annapolis a second paralytic attack ended the parent's life.

The son's health was now such that both his physicians and his friends advised a change of climate. They recommended an ocean voyage. Lynch wanted to go to Europe, but his wife pointed out the great danger of being captured. Finally it was agreed that they would proceed to St. Eustatia and then take a circuitous route to Southern France. Mrs. Lynch and he accordingly started on this roundabout trip to Europe, sailing just before the close of 1779. Their friends waited and waited, expecting to hear from them; but no word ever came. Did they fall into the cruel hands of pirates? Did the enemy capture them with death ensuing before they could write home? Did the ship founder in a storm? There has never been any answer to any of these three questions. They sailed—and that's all! Nothing was ever known of their fate.

Lynch and Thomas Heyward, a compatriot, signed the Declaration similarly; as Heyward's father had bestowed his own first name upon his son, the latter distinguished himself from his sire by adding 'Junr.,' and Lynch did likewise a few moments later. Each had the same first name, and each had a sufficiency of dramatic or tragic happenings.

The British army lay in the vicinity of Charleston when Heyward presided as a judge at a trial of certain persons charged with treasonable acts. His position made him particularly obnoxious to the enemy. With the fall of the city Heyward became a prisoner, and there was much conjecture over what sort of punishment would be given to him. Though treated harshly, he survived and retained his indomitable spirit. When he was about to be transported to St. Augustine for imprisonment he defied the British by singing 'God Save the Stars' instead of 'God Save the King.' His slaves were seized and taken to Jamaica. The hatred of the British almost cost the lives of his two brothers.

*Heyward's Grim Determination*

Even when Heyward was released from prison, his troubles were not ended. He fell overboard from the British ship conveying him to Philadelphia. He was not missed for several hours; then he was found holding to the rudder of the ship. It had required the grimmest sort of determination to hang on until he was discovered and rescued; but the incident merely illustrated the stuff of which our forefathers were made.

Back home again—to rest and recuperate? Yes, but troubles rarely come singly. His wife died. Heyward's grief was so great that his friends feared the man would lose his mind. He pulled himself together and went back to the bench. He retired in 1791 and had a comparatively unruffled existence until his death eighteen years afterward.

# Birth-Control—a World Blight

(*Continued from page 7*)

Greater efficiency and freedom in doing God's work, the desire of being wedded to Christ, are motives which justify religious celibates. They can rise superior to the claims of nature, by prayer, aloofness from their sex-opposites and by becoming engrossed in work. Some fail but the majority are an honor to mankind. Observation shows that their health does not suffer from sex-isolation. Their celibacy is a variation from the scarlet monotone of a sex-mad world. There is no danger to the propagation of the race from the abstention of a comparative handful; and at least they embody and express a noble aspiration and heroic effort, whereas Birth-Control pandering to sexuality, lacks the austere nobility of a lofty ambition and difficult enterprise.

But even if Birth-Control were not evil in itself, it would be evil and forbidden on account of its direful results. Birth-Control is opposed to the family. Birth-Control militates against the family because it is in contradiction to the threefold end of marriage: (1) The procreation of children and the propagation of the human race; (2) mutual affection and respect of husband and wife; (3) the legitimate indulgence of concupiscence. Moreover, it promotes divorce and also immorality among the unmarried.

*May Change Into Race Suicide*

If Birth-Control gets a hold on the whole race of men, the race will perish. Birth-Controllers intend only to reduce population to a moderate size by their practices. But they are letting loose a tremendous malignant force which will change Birth-Control into race suicide. We know from observation, history and possibly from personal experience, the volcanic, devouring power of sexual passion. The downfall of Rome and Greece bear witness to it. It will drive men to the quest of pleasure without regard for children even when children will be needed. Patriotism, race welfare, religion, family, decency will not appeal to them, because they will have become unnaturally callous to all high appeals. Also, they will not be able to procreate because Birth-Control leads to sterility. And thus, if Birth-Control succeeds, the earth will become a desolate, soundless planet, drifting through space, as dead as the moon. Possibly the universal conflagration which, according to Christ's prophecy, will consume the earth at the end of the world will be this fire of lust.

*Yellow Peril Will Be Actualized*

But there is one group of men who will probably resist Birth-Control and survive: Catholics. The Church will always denounce Birth-Control as an unnatural vice and exclude from her communion members who indulge in it persistently. Generally her children obey her, as is evident from the statistically known greater fruitfulness of Catholic families. Let my non-Catholic brethren recognize and prevent this most likely Catholic monopoly of the earth. We Catholics should like to be important in the world but not at the cost of Protestant race suicide.

If Birth-Control gets a hold on the white

races of America and Europe, the Yellow Peril will be actualized. For most probably, Birth-Control will not succeed with the Orientals. They will be suspicious of Neo-Malthusian propaganda from the West and as bad as they may possibly be otherwise, they abhor this unnatural crime. Hence, their overwhelming numbers, along with their need of geographical expansion, their envy of the rich fields of the temperate zone, their long-suppressed indignation at western aggrandizement in the Orient, their desire of revenge and their potential leadership, which in past times embodied itself in Attila, with his Huns, Ghenkis Khan, Tamerlane with his Tartars and the two Turks who took Constantinople and worked their way to the walls of Vienna, will stir them to flood the western world; the European culture, civilization and Christianity of 2,000 years will be ruined; America, with its wealth and its tradition of liberty, will be submerged in a yellow sea of humanity; and some day a handful of desolate whites, cowed on some obscure mountain-top, will look across the land and see their former cities with their streets, office-buildings, palaces and churches swarming with myriads of triumphant barbarians out of the loins of Asia.

*Will Need No Revolution*

If Birth-Control gets a hold on the so-called better classes of America, but not on the masses, we shall need no French Revolution nor Russian to project mobs into the mansions of wealth, with the torch and sword in hand and madness in their hearts. For the scions of aristocracy will thin out and perish of their own volition; and their possessions will naturally cry out for new masters. Now this is likely to occur. For they are principally the ones who, not satisfied with the natural luxury of their environment, are seeking unnatural indulgence through contraception. Shall we warn them to open their eyes and see how their system of life has worked out in the past; for instance, in New England which now should be called New Ireland; in France, which would have been submerged in the war by the greater numbers of Germany had she not been helped, and where today statesmen are legislating in vain against Birth-Control for the salvation of France? Shall we warn them or shall we leave them to their fate, under the conviction that their passing will be good riddance of a decaying limb on the tree of society?

But even if Birth-Control should not succeed to this extent, it will still be an unspeakable evil. It is such today. For it is depriving innumerable infants of their right to live here and hereafter. The sun, the sky, fields, rivers and mountains are awaiting them; but the manifold beauty of the universe they shall never behold. From the darkness of chaos, they are clamoring, so to speak, for the warmth and milk of their mother's breasts, her arms, caresses and smiles, her cradle, her home. But Birth-Controlling wives and husbands, smothering the instinct of parenthood, will not hearken to their cry. This is not figurative speech; for those babes have a right to live and their right clamors for a hearing. Or rather, to speak more exactly, God cries out to wives and husbands in their behalf. Birth-Control is the slaughter of the innocents, a worse one than Herod wrought; for his victims only had their lives curtailed; the victims of contraception are utterly deprived of life. If to take away a man's property, or his wife, or his reputation, or his life is evil, how superlatively wicked it must be to prevent an infant from even tasting life! And though the child be destined for hardship, yet, let him come; for to live in hardship is better than not to live at all. Christ, when on earth, said: 'Let the little ones come unto Me'; and now in heaven He says the same to the Birth-Controlling parents: 'Prevent them not. Of such are the Kingdom of Heaven.' Beware of this sort of anticipatory murder! Otherwise, when you stand at the throne to be judged, infant hands will be raised and infant voices cry out to the Judge for vengeance against you their own potential parents who deprived them of the possibility of paradise!

*Those Babes Have a Right to Live*

Birth-Control destroys also the secondary end of marriage, the mutual affection and respect of husband and wife. True affection and gross carnal indulgence cannot coexist. For the one is tender and spiritual; the other is commoner than clay. But Birth-Control develops the habit of stark sexuality. For it concentrates the mind upon perversion. Moreover, affection is spontaneous, not counting results; and therefore the cool, scientific calculation and preventive foresight of Birth-Control of necessity dissipates affection. Also, it destroys mutual respect. Birth-Control, excluding children, affectionate tenderness, and therefore also respect, reduces men and women to the level of cattle. The nobility of love disappears, the charm of romance is dissolved, idealism perishes, chivalric knighthood and ladyhood are no more; and these sweet excellences of human nature are supplanted by the unveiled sex relationship. Indeed, Birth-Control lowers us beneath brutes, for brutes are not unnatural.

> 'Let my non-Catholic brethren recognize and prevent this most likely Catholic monopoly of the earth. We Catholics should like to be important in the world but not at the cost of Protestant race suicide.'

*When Marriage Is a Rope of Sand*

Without children, the bond of marriage is a rope of sand. Birth-Control also leads to immoral relations. Even the purest men and women who retain their integrity through high motives of virtue are helped to be good by the prosaic and menial consideration of the disgrace of unwedded motherhood. Let Birth-Control take away from unmarried women the likelihood of being found with child, and promiscuous sexual unions will probably become the normal condition of society. If that happens, we might as well throw up our hands in despair and pray for the end of the world.

In the last analysis, the reason why men have a knightly respect for women is because they are mothers, either actually or in prospect. The charm of maidenhood, the grace of wifehood are only secondary forms of beauty reflected from the loveliness of motherhood. A man may be captivated by a woman's figure and face, and fascinated by her character, but he is annihilated in awful reverence (perhaps without recognizing the reason why) before the majesty and sweetness of her maternity. Take away motherhood from woman by Birth-Control, and a man may still be a flatterer, a passionate suitor, a royal entertainer, a boon companion, a willing victim of her seductiveness; but he will not be a knight. *Woman must carry half the burden of life.* Man fights the elements, promotes business, makes money and wages war. Woman must bear and rear children. If she refuses, she will be an ornament in society—and a very expensive one at that—but nothing more. And man will despise her for her inanity. A brave man faces death in war; a good woman goes down into the shadow of mortality every time she bears a child. All honor to her for that! But if she declines that danger and that glory, she is as contemptible as the man who shirks the battlefield. When a husband goes to the front, his wife says: 'Stay with me'; but she wants him to go and would condemn him if he stayed. When a wife marches to birth, her husband may say: 'Don't.' But he wishes her to submit to the ordeal and would think less of her if she shunned it. And if her man dies afield, she grieves for him, but glories in him. And if his woman dies abed, he is broken-hearted but proud. If therefore a husband wishes to spare his wife in the name of chivalry, let her be wise enough to decline his indulgence, that she may insure his chivalry.

*Causes Bodily and Mental Harm*

The excuse of insufficient means is too often humanly speaking justified. But wife and husband must put their trust in that heavenly Father who feeds the birds of the air and tends the flowers of the field and who will provide means, in some way or other, for their children. Also it is possible that some newlyweds have extravagant ideas of the requirements of a family. But meanwhile let us continue to agitate against numbers of capitalists whose monopoly of wealth makes it extremely difficult for ordinary people to acquire enough money to raise a family in comparative ease.

There is still another thing the Church has in mind in forbidding Birth-Control—the bodily and mental harm it causes to the woman. In England, Doctor C. P. Blacker, Dr. R. Gibbons, physician to the Grosvenor Hospital, Dr. Ernest Ware, surgeon to St. John and Elizabeth Hospitals, Dr. Hector Cameron, physician to Guy's Hospital, Dr. Mary Sharlieb, gynecologist to the Royal Free Hospital, Dr. F. J. McCann, surgeon to the Samaritan for Women, Sir A. Rice-Oxley, M. D., Dr. Bellingham Smith, senior gynecologist at the London School of Medicine for Women, Dr. Arthur E. Giles, senior surgeon of the Chelsea Women's Hospital, Dr. T. W. Taylor, President of the British Gynecological Society; and in America, Dr. S. J. Holmes, Zoölogist of the University of California, and Dr. Howard A. Kelly, gynecologist of Johns Hopkins Medical School are only some of the first-class surgeons and physicians who have pronounced from their experience that contraception injures women bodily and mentally. The latest report I received is from Dr. Hastings Gilford, of London, a former Hunterian professor of the Royal College of Surgeons, who, in a lecture delivered at the Royal Institute of Public Health, said that grim cancer is the nemesis which follows Birth-Control and the evasion of nature's laws. Dr. Courtenay Dunn, of Torquay, expressed his agreement with Dr. Gilford and added: 'It is better to trust to Providence than seek for aid in a direction of which you are ignorant.'

*Better to Trust to Providence*

# America Writes a Book

(Continued from page 5)

With a dog team on the Minnesota-Canadian boundary.

This resolve of mine was obviously sound. A writer tells of the things he sees, knows, or guesses at. He can enter virgin fields as well as a realtor can. Very well.

---

The scene shifts. Comes the dawning, in short, of a new day. My home at present is in a town of a population, in round numbers compiled by the Boosters' Club, of about four hundred. It lies in the heart of the Rocky Mountains. The principal industry is stock raising.

The place in which I live must not be confused with certain small colonies such as those on the New England Coast which constitute an easy haven for those who would express themselves in terms of the arts; neither must it be considered in terms of a summer resort nor of a climate which beckons. It is not in California—it is in Wyoming. It is a small western town. Its buildings are either of logs or of unstable and unpainted boards. The thermometer reaches sixty below zero in winter; and in summer, when it rains, the streets are lanes of mud. It is a typical small town of the Rocky Mountain ranges, and it is thirty miles from the nearest railroad.

And yet, for all this, writing for publication is the principal industry of the town and of the valley in which it is located, excepting only ranching and the guiding of tourists, in point of numbers engaged in it.

I do not take into consideration vacationing writers who come into the valley during the summer looking for local color or cheap lodgings or both. I count only the bona fide residents of the place.

In the town itself there are, to my knowledge, seven persons who engage to some extent in writing. Two of these, the editors of the town newspaper, I leave out of the reckoning at once. Only those who aspire to national circulation are counted hereafter. That leaves five. Two are wooing letters with the object of marriage. I suspect that a third, who declares his real ambition lies elsewhere and that he writes for his own amusement (foregoing the usual excuse: 'just jotting down a few notes for my grandchildren'), is another. The fourth and fifth are dabblers. None of these, so far, is dependent on writing for a living. One is a grocer, another a clerk in the hardware store, a third is a truck driver, another is a school-teacher.

Now let us consider the valley of which the town is the center. It is a distinct unit, for it is surrounded by mountains, undefiled by a railroad, isolated from other areas of fertility. It has a population of about eight hundred. In this valley (including those in the town itself) there are, to my knowledge, ten persons engaged in some phase of writing with the object of national circulation. In none of these totals do I include myself.

Two are novelists of national importanc —a man and his wife. The man is gainin fame as a poet in addition to his recognitio as a novelist of ability and as a writer o short fiction. Both lived in the valle before taking up this work. That is to say neither came here for the purpose of writ ing. Of the rest, one is a poet, one is a lad who is beginning what she hopes will b the career of a writer of short stories another contributes occasional articles t sporting journals.

Of all of these, only three, countin myself this time, are professional writer in the sense that it is our only and ou practiced profession. The rest engage i other work and write only when routin matters do not engage their attention But it is competition. There are two hard ware dealers in town. One of them com plained to me, the other evening, abou competition. 'If it wasn't for competition, he declared, 'I could make a good living You're lucky; you're a writer.'

I laughed at him. 'You don't know wha competition is,' I said; and I pointed ou the competition in my business, thoug I failed to mention that his clerk was case in hand. 'How would you like it, I asked, 'if, in addition to your othe principal competitor, half a dozen or s persons in the valley were to carry a side line of hardware, offering it for sale?'

How many others, in addition to thos I have mentioned, are engaged in part time writing in the valley I have no idea There are doubtless a number. For every person who admits that he aspires t literature or its satellites, three or four ar either studying or practicing surreptitiously Not until they have been favored with som measure of success do they let their secre escape from its cradle. How many other in this one little valley are carrying manu scripts to the post office under their coats? I do not know. Perhaps it is well I do not.

True realization of the extent of this nation-wide competition in the most crowded line of business in America came to me suddenly. I had dropped into the grocer's store to talk with the proprietor. I had heard that for many years he had been a professional gambler in the gold camps of the old West. Surely, I thought, he must be full of experiences. I sat down by the stove and began to ask him about things. When we got to the subject of gambling, he excused himself, reached to a high shelf, and brought out several copies of the *Saturday Evening Post*. He handed them to me. 'I wrote it all in this series of articles —you can look them over at your leisure,' he said.

When I had read and returned them, he gave me other magazines with other articles in them. In the course of time I found that the principal use of the store strong-box was a storehouse for manuscripts.

One day I stopped at the store to buy some groceries. While I was there a small truck drove up and a young fellow with a tanned face began to carry in some heavy boxes which were consigned to the grocer. He staggered in with the last one, a crate of melons, and as it crashed to the floor he straightened up and said: 'Well, I sold a story to Young's magazine today. I think it was one of the best things I've written this year.'

I left the store and went home, and every house along the way suddenly appeared to me as a fortress in which my competitors were laying their plots.

Early last summer a catastrophe occurred in the valley. There was a landslide of huge proportions which, by damming a river, formed a large lake and flooded out some ranches. One of the ranchers had a very narrow escape, avoiding the onrushing wall of earth and trees only by desperate riding in the face of it. His personal story would have been a good one. I at once sought him out and began to lay the foundation for a fine long interview. But he shook his head. 'I'm going to write it myself,' he said.

He did. He worked on it in his spare time all summer, and came to me for advice as to the proper manner of marketing it, and so forth. I gave him some photographs to use with the article.

---

As I write the above paragraphs, what is left of my mind travels back to last winter and finds me tramping along behind a dog team on the Minnesota-Canadian boundary. There were four dog teams and some dozen or so men in the party, and our route lay for a hundred and fifty miles through the wilderness of the Superior Forest. While the primary purpose of the trip was of a different nature, my own excuse for going was to interview the lone trappers of the region, in connection with my new business as a noted and famous writer.

The first trapper at whose cabin we stopped proved a willing talker, and from him I obtained interesting information. I confined myself to asking about certain phases of a trapper's life, reserving other angles for the next stop.

Two days later we arrived at the next cabin, and I eagerly awaited my chance to talk with the trapper. His place was seventy miles from the nearest road, and he stayed there all winter, alone. When the opportunity presented, I asked him what he did during the inevitable dead hours during the winter. For reply he nodded to a volume on the shelf above my head. I took it down. It was a book of verse: an anthology of popular favorites of all ages. 'I can recite any one of them,' he declared; and I found his assertion true.

I persisted in my question, and finally the trapper went to a locker under his bunk and brought out a thick tablet of writing paper. He handed it to me. At his request I opened it, and found every page crammed with writing in pencil. Looking closer, I saw it was verse. Said the trapper: 'If you want to know about the life of a trapper, those poems will explain all about it.'

I looked them over. He had written about the things he did, the things he saw. Some of them were far from bad. 'I'm going to try and market them in the spring.'

I left that cabin with certain misgivings fluttering in my breast. It is not ethical for one writer to write about something that another has started on. But still I could justify my trip into the woods by interviewing the head of our party: a quarter-breed Indian, the chief of the game wardens of the district and a former noted outlaw trapper. He was sure to be a mint of information. So toward the end of the trip, having incurred his good will meantime, I approached him.

'My experiences?' he repeated, smiling slightly, 'Well, I'll tell you—if you'll wait until spring, when my book is finished—'

But, as they say in the stories, I waited to hear no more. I stumbled back to my tent and sat down beside the roaring fire and listened to the howling of the huskies outside. With the stealth of an eavesdropper I tried to find something significant in their discordant keys, expecting every moment to have one of them creep into the tent and growl at me: 'Put up your pencil, old-timer—after all, these are my howls!'

---

America has a book! Yes, and I can name it. It is 'How to Write Stories.' Of course I have touched only on the few instances that have come under my observation. Editors of magazines, students of literary affairs, can tell about it from the other end—the receiving end. Of that I know nothing. I do not take into account the new flood of magazines written by the heroes of the 'true' stories. Nor the new 'newspapers' now setting the journalistic world on its head, whose readers constitute their editorial staffs.

I know that I have found the most crowded field of endeavor in America. I thought I was doing something out of the ordinary; I have fallen into the meshes of universal competition.

What does it all mean? It means that America is writing its own book. It is its own biographer. The click of a million typewriters resounds from coast to coast. Never before in all history has a nation taken this task out of the hands of its ordained scribes and sat down to tell about itself. And the result? Some day somebody with infinite patience will delve into the mass of stuff and will compile a literature of the present day that will live as the most complete mirror of a time that ever has been written.

And what of the professional writer? Alas! unless he can help his grocer with his spelling and his landlord with his grammar and give tips on the literary market to the butcher (and it looks as though some had already started this!), thus canceling amounts due, his days are numbered!

America is a funny outfit. You declare that America 'has a book' and you laugh up your sleeve at the joke. But what use has America for a book? It is writing one. It may be a sort of a mail-order, quantity-production, paper-backed affair, but, after all, it's a book, and books are notoriously exempt from judgment until they are a century old.

---

The writers' characters have signed a declaration of independence. The creative author with infinite artistry forms on paper the body and soul of a character for his book. The character lives, breathes. Suddenly it steps out of the typewriter, grasps the writer's arm, and cries: 'Stay! If I'm to be written about, I'll do it!'

Ah, for the good old days when characters were characters and stayed in their places! What would literature be, for instance, if Wilkins Micawber had sold his family budget account to Bernarr McFadden? If Jean Valjean had searched his own heart? If the Three Musketeers had held out for higher royalties when Dumas was undergoing the pangs of hunger? If Boswell had been given the gate? If Conrad's sailors had borrowed his typewriter instead of a plug of his tobacco?

'But,' interposes the Chronic Objector, 'what if Samuel Pepys had not written his own diary? Unskilled, a botch of a job, infinitely dull at the time and the work of a rank amateur at letters, it stands among the great literary works of all time and is the truest reflection of an age of history ever put on paper.'

---

'The average American cares nothing for fine literature!' The howl rises from a dozen professional throats.

The average American looks at the best offerings of the day, sneers, turns to his own typewriter . . .

'If you want to know about the life of a trapper, those poems will explain all about it.

**SELL SLICKERS!**

**$8 A DAY IS EASY**

Right now is the time to sell Slicker Coats. $2 an hour, $8 a day, $50 a week is easy selling these coats. Every man, woman and child a prospect. Comer Slickers come in 14 beautiful shades. Style up-to-the minute. Guaranteed workmanship and materials. No experience or capital needed. Write today for the facts about this big money-making opportunity.

# John Galsworthy—An Intimate Talk

(*Concluded from page 2*)

Here Mrs. Galsworthy, in spite of my protest, deserted us, saying that doubtless we two mere males wanted to gossip!

Well! We gossiped.

Presently I asked, bluntly:

'Which do you prefer writing, plays or novels?'

I think I saw in his eye—'*What* a question to burst on a poor fellow!' It certainly gave him pause.

'I don't think I can say definitely. Yes; I prefer writing a novel; it's more luxurious. One can spread oneself. Character, nature, one's moods, all have more chance. It's not so darned constricted as the play form. But the actual writing of a play—when I get down to it—is more exciting; I quite thoroughly enjoy that. No, I don't make scenarios; I don't know exactly what my characters are going to do; though, in plays at all events, I do work toward a more or less discovered peak.'

***He Is a Lover of Dickens***

'I suppose you find, as most dramatists do, that actors make of your characters something different from what you have in your mind's eye?'

'Don't they just? It would be impossible to mold an actor into precisely what you mean him to represent. He's confined by his physique, his voice, his mannerisms, his temperament. They often add to and sometimes find in my characters what I never saw there myself.'

Our conversation was vagabondish, as interesting talk usually is.

He said he was a great lover of Charles Dickens:

'Which of his do I like best?' Another pause, suitable I think to his make-up. Then: '*Pickwick*. I read the whole of it, barring the rather awful pitched-in narratives about sextons and goblins and that kind of fowl, aloud to my wife the other day. We had the best possible time, though I've read the book a dozen times at least. After *Pickwick—David Copperfield;* then *Great Expectations* and *Our Mutual Friend,* which used to be my favorite as a boy. Of course London has changed out of knowledge since he wrote; but he was generally fundamentally true to human nature.'

'But what about being the wild caricaturist many say he is?'

'He *is* a caricaturist; but it's not merely silly exaggeration. It's exaggeration of the truth. His eyes pierce to the heart. Look at Micawber! He's as true to life today as he was the day he was born.'

'What do you feel about the later Russian dramatists and story-tellers,' I asked, with a violent switch-off. 'Aren't they too gloomy?'

'Chekov I admire greatly. He isn't very late, you see. I haven't read much of the others.'

Somehow, or nohow, we swopped round onto Shakespeare.

'Of course he wrote Shakespeare! He may have been given hints and suggestions by Southampton and Oxford and other highly placed friends, which helped him toward characters and atmosphere which otherwise would have been out of the reach of his knowledge. I don't mean that they actually shared in the writing of the plays; only that they provided him with material which he adopted and adapted. What we know as the real Shakespeare touch was so utterly different from what we know of the touch of any of his supposed doubles that we can be quite certain, apart from other evidence, that he was not one of them . . . After *Hamlet* which plays do I enjoy most? *After?* I am not sure that I should put *Lear* after *Hamlet.* But, after those tremendous tragedies, I love some of the comedies best, *A Midsummer Night's Dream, Twelfth Night* —what a dreadful word "twelfth" is to spell!—*The Tempest.* But after all, what do we read Shakespeare for? For his use of words. There's never been anything like it! . . . Don't you find you always read the same sonnets, and never those in between? A long time ago I marked meticulously those I really liked, and I've never been able to add to the list. Horrible instance of a static mind! Or else, perhaps, those I marked really were the best. I wonder.'

From the England of Shakespeare we went across to America of today.

'Yes, we've just come back from a winter in Arizona; what a perfect winter climate!'

'Tell me all about America . . .'

First he looked amazed at that wild question of mine; then, seeing my smile, laughed:

***His Plays Popular in America***

'Oh, no! I'll tell you one thing, I've always found America a good tonic.'

I agreed with him; and long may it remain so.

'What about American writers?'

'*What* about them?'

'What do *you* think about *them?*'

'A lot. Hawthorne? Yes. And Thoreau? By all means. And Poe, and Crane, and Ambrose Bierce. By the way, Thoreau would have something to say about America today, wouldn't he? The modern school of American novelists? My opinions are only half-baked. Some of their work I admire greatly. Sinclair Lewis, *Babbitt* particularly; Willa Cather; Scott Fitzgerald—very promising, judged by his latest book of short stories especially. Hergesheimer's *Three Black Pennies.* Then there's a young writer who I think will do very big things; James Boyd—his novel *Drums* is exactly what an historical novel should be and so seldom is; there's no sham or shoddy about it; it's not made-up; it's genuine and intimate and full of human nature.'

'*We* have *The Cloister and the Hearth,*' said I.

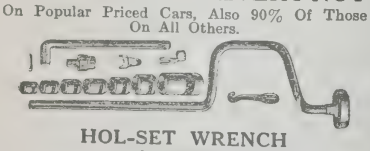
'We have.'

'Your plays have done well in the States?'

'Some—very well. *Old English* is a great success there now. George Arliss gives an extremely clever impersonation.'

When he casually mentioned the emotion he felt when watching Norman McKinnel playing the last act of that moving play in London, I said:

'So dramatists are moved by their own work?'



'Of course. Why not? I don't see how it could be otherwise.'

'Do you "produce" your own plays?'

'Not exactly that; but I attend the rehearsals. And I make plenty of suggestions. But it's a mistake to think you can force your own conceptions too much. I remember with my first play, I wasn't able to be at the first week's rehearsals; when I did go, I found to my amazement that a very clever actress was giving a perfect sketch that was just about the opposite of what I'd imagined. One couldn't and didn't want to say a word. Actors and actresses aren't gramaphones or parrots.'

# A Mixture That No Nation Can Stand

(*Concluded from page 4*)

Therefore, the fight must go on. There is no room for compromise. Both sides cannot be satisfied. It is what one side wants that the other side, backed by the Constitution, says cannot be. And so long as the Eighteenth Amendment stands, it will be the duty of the Congress, the President and the courts to enforce it.

President Coolidge's attitude toward prohibition does not make much of a hit with the drys. They feel that he mixes too much politics with his enthusiasm for enforcement. Personally, of course, as well as officially, he is dry. Politically he balances things nicely. His Attorney-General, an old Vermont lawyer, talks prohibition straight from the shoulder and even raps Government officials for criticizing the law that they are directed to enforce. At the head of the Treasury Department, however, is Mr. Mellon, a retired distiller who, under the Volstead Act, is the chief prohibition enforcement official. Mr. Mellon probably believes he is enforcing the law as well as he can. The drys do not agree with him. Many severe things have been said about Mr. Mellon's brand of enforcement. Perhaps the best that can be said about him is that for a former distiller he is a great prohibitionist.

At that, enforcement is making progress even under Mr. Coolidge and Mr. Mellon. It is making progress because it had to go ahead if it were to move at all. Mr. Harding left a record in this respect that could not easily be touched without improving it. In other words, Mr. Coolidge is the beneficiary of a poor precedent. But as the fight against booze grows hotter, he and his successors will have to do a still better job of enforcement. The drys are not forever going to put up with make-believe enforcement at Washington. They know the law can be enforced if the President is determined to enforce it. It is nonsense to suppose that the Government cannot prevent the illegal withdrawal of millions of gallons of industrial alcohol each year if it wants to.

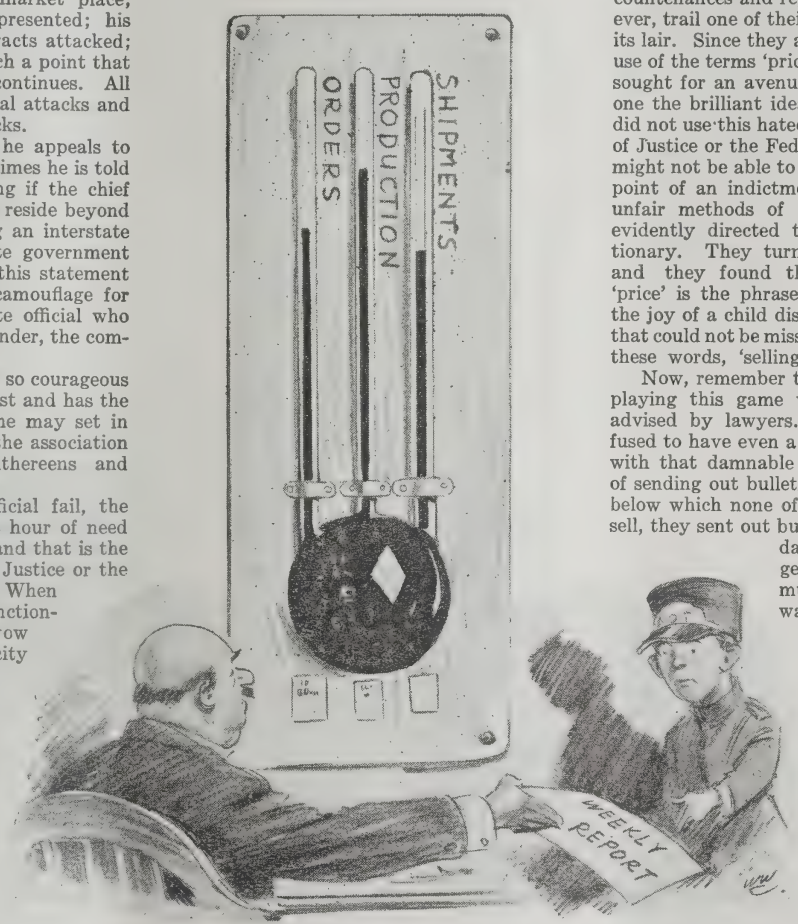
# The Price-Fixing Association

(*Continued from page 6*)

If perchance he is bold, risks his all and fights back, then it is war to the hilt. All the practices of business piracy short of physical attack are brought into action. The daring one is put on the black list or boycotted. He suddenly finds his products disparaged throughout the market place; his financial condition misrepresented; his ability to carry out his contracts attacked; and his price cut under to such a point that it means bankruptcy if he continues. All along the line there are frontal attacks and from the side line flank attacks.

Harassed and desperate, he appeals to his state government. Sometimes he is told that the state can do nothing if the chief offender or group of offenders reside beyond the state lines and are doing an interstate business over which his state government has no control. Sometimes this statement is true; sometimes it is a camouflage for 'passing the buck' by a state official who fears the power of the commander, the combine or the association.

Should the state official be so courageous that he does not count the cost and has the law to cover the situation, he may set in motion the means by which the association can be smashed into smithereens and thrown out of the state.



But should the state official fail, the harassed business man in his hour of need has just one place of safety, and that is the bosom of the Department of Justice or the Federal Trade Commission. When these two departments are functioning normally they can throw down a barrage of publicity either through the obtaining of an indictment or the issuance of a complaint that will precipitate a flight of the 'arm-in-arm' paraders out in the hall after the main meeting of the association is over. Even the telephone will be silenced until the hunt of the Federal officials is ended.

Now, of course, such a disturbance, or dream of it, is very distasteful to a commander-in-chief. He has been known even to fret over such a possibility or actuality, and, in a state of dyspeptic disgust, charge down upon his lawyers, economists and legislative representatives and demand that they make good their salaries by devising some automatic scheme that will permit his price slumbers to be unbroken.

We Americans pride ourselves on our sense of humor, and rightfully so, but when one delves into the means by which some of our legal fraternity, with serious countenances, devise means to evade the irritations of our anti-trust laws at the behest of their masters, it would tax the ability of a Voltaire or the phrase-making power of a Balzac to describe the sophistry and absurdity of these devices.

Weird and wonderful are the schemes devised by our lawyers to circumvent the laws against organized selfishness. All of this might be forgiven them if, in explaining the devices to the commanders-in-chief, they had indicated that they spoke in a Pickwickian sense or even showed by a smile that they understood the humor of their 'absurd sinuosities' or 'sinuous absurdities.'

Let us step behind the closed doors of another of these associations in an industry. They issue a uniform price list which all members follow. Of course the commander-in-chief of the dominant company in this association is not present, but his representative is there. The doors are closed. All of the formal business of the meeting is transacted. Then, solemnly serious, the bellwether of the flock arises and says: 'It may be of interest to you to know that our company's discounts are going to be as follows.' Immediately there is a rustle of paper and pencil. Out come the notebooks and as the bellwether intones his prices there is the sound of scribbling as the members jot down the figures and, presto! the prices are changed. Without any formal agreement the prices thus become practically identical, as is testified to by the helpless purchasers. Charge one of those present with having connived in the fixing of prices and he will repudiate the indictment with *hauteur*.

The information was sent to each member weekly

In just such a way were the prices advanced in this industry in 1918 and 1919 and it was through such a mechanism that the brakes were thrown on and prices held up when the consumer and the law of supply and demand cried out for a price decline until there came the buyers' strike of 1920.

For downright satirical comedy in its efforts to escape the penalty and yet fix prices, the furniture industry furnishes a most delicious, and at the same time deadly comedy. Enter again into the mysteries of the methods of wise men. To mention in their presence price agreements would bring condign punishment in the form of scowling countenances and reprimand. Let us, however, trail one of their sinuous absurdities to its lair. Since they abhorred and feared the use of the terms 'price' or 'price fixing,' they sought for an avenue of escape. To someone the brilliant idea occurred that if they did not use this hated word the Department of Justice or the Federal Trade Commission might not be able to follow their trail to the point of an indictment or a complaint for unfair methods of competition. So they evidently directed their steps to the dictionary. They turned to the word price and they found that the equivalent of 'price' is the phrase 'selling value.' With the joy of a child discovering an Easter egg that could not be missed, they impinged upon these words, 'selling value' with all fours.

Now, remember that the men who were playing this game were fully grown and advised by lawyers. Thereafter they refused to have even a speaking acquaintance with that damnable word, 'price.' Instead of sending out bulletins that named prices below which none of their members should sell, they sent out bulletins with figures and data set forth that together made up 'minimum selling values.' The way they arrived at these 'minimum selling values' is probably one of the most unique schemes in the history of price control in the business world.

There was a certain retired manufacturer who in some manner became universally recognized in the industry as a wizard in estimating the selling value (price) of various kinds of furniture. In the industry there are a number of associations scattered over the United States who make different kinds of furniture and there are also a number of associations who make the same kind of furniture but are located in different portions of our country. How this retired manufacturer was able to skip up and down the land arriving at selling values for every association without seven league boots is a mystery. But he did! And he did it so successfully that he practically eliminated price competition. Through his efforts the members of these associations advanced up the field of competition in uniform and unbroken ranks, raising their selling values to the dizziest heights attained in 1919 and 1920.

When, in the fatal year of 1920, the host of ultimate consumers finally broke their bonds, stood upon their feet and made a frontal attack upon the business world through the buyers' strike, the furniture industry, with the able guidance of this retired manufacturer and the system which he operated, held prices up long after they

should have gone down, while the members retreated slowly but in perfect order, reducing their prices uniformly and gradually even in 1921 over the prostrated bodies of the buying population.

In the spring of 1920, lumber prices were pyramiding with such dazzling rapidity that a number of the honorable men in the lumber industry protested.

The only thing that will satisfy the sensitive soul of the price fixer is to set up a price-controlling machinery that is so automatic that it is favor-proof, fool-proof, and conscience-proof, and this the lumber industry almost did. With the aid of able legal counsel they brought into being a barometer with three perpendicular tubes rising parallel out of the bulb. The first tube was designated 'Orders,' the second 'Production,' and the third 'Shipments.'

To make the information portrayed by the barometer striking to the eye, the bulb and tubes were colored red. On the side of the tubes was language interpreting the relation of the height of the red color in the three tubes. Beneath the bulb was language explaining how to act when the barometer indicated curtailment of production and increase of price or vice versa. Opposite the baromoter was sufficient data showing orders on hand, shipments during the week and balance orders on hand and a comparison with previous reports.

This barometer and the information connected with it was sent to each member of the association once a week. *There was no written agreement and yet prices soared simultaneously and concertedly.*

But, alas and alack! forgetting the old adage of 'Do right and fear no man,' some of the members did write each other, left their letters in their files, and they ultimately came into the possession of the Federal Trade Commission. One letter from their leader communicated to these competitors the fact that the association would shortly get out a barometer which had been submitted to their counsel and met with the counsel's approval. The barometer would automatically forecast market conditions, being based on orders received and shipments made. Where the shipments exceeded the orders it indicated an advancing market and whenever the reverse was true it indicated a falling market.

Continuing the explanation, the letter said that once a month they would get out another barometer based on production which would indicate an advancing market —when shipments were in excess of production—and a falling market when the reverse was true. Under such conditions the members were advised to increase their production when the orders and shipments were in advance of production, and decrease them when the production was in excess of orders and shipments. To this he added the significant statement: 'This (the barometer) will give the information graphically.'

The barometer gave the information so graphically that, with some urging toward curtailment of production, prices were pyramided and the ultimate consumer was caused to become hysterical in his buying. The price of lumber in one great area jumped from $13.40 in 1915 to $55.55 a thousand in 1920, with a margin of profit of $1.09 a thousand in 1915 and $26.35 a thousand in 1920

As far as an automatic method of price fixing went, the system established in this industry was superb and only failed when prices got so high that the consumers went on a strike. Even then there would have been difficulty in finding out the cause had not some members of the association written letters.

# A Dance A Week

## DICTIONARY OF DANCE TERMS

'FORWARD AND ADDRESS'—(8) Couples join hands, walk forward four steps and address the opposite couple. Return to place, walking backward.

'FORWARD, AND LADIES TO CENTER, FACE OUT'—(8) All join hands, forward four steps; back four steps; forward again four steps; gentlemen turn partners half around and return to place. Ladies remain in center, facing partners.

'GRAND RIGHT AND LEFT'—(16) Face partners, salute, then join right hands, gentlemen moving to the right, ladies to the left. Gentleman drops his partner's right hand and takes next lady's left in his left; next with right, etc. (This is a movement in which the two lines, moving in opposite directions, weave in and out.) When half around he meets and salutes his partner, giving her his right hand, and continues to place. (In saluting and meeting, the salute always precedes the taking of hands.)

'GRAND RIGHT AND LEFT HALF AROUND'—(8) Same as above. Meeting partner halfway around, salute and stop. If 'back again' is called, gentleman, instead of saluting his partner, joins right hands with her right, turns half around facing in the opposite direction, then right and left to place. If 'Promenade to Place' is called after the salute, all promenade to place.

'GRAND SQUARE'—(16) In this all couples are moving at the same time. First four forward, sides separate. Sides turn backs to each other, and walk four steps to the corner; make one-quarter turn and walk four steps to head places; then make one-quarter turn, walk four steps to center, meet partner and take four steps to places. At the same time the first four advance four steps to the center, meet new partner, turn one-quarter, and walk four steps to side, drop hands and walk four steps forward, turn one-quarter and walk four steps to place. The movement is reversed by the call 'sides forward, first four separate.' Each dancer will thus make a complete square, four steps on each side.

'GIRL I LEFT BEHIND ME'—First couple lead to the right, balance, pass through; balance back to back, and turning swing the girl behind. The first gentleman with new partner leads to the next, passes through, balances, turns and swings that girl behind him. And so on with each new partner until he is back in original place. The next gentleman on the right begins the movement, and so on until all four gentlemen have gone through the movements, and each couple is in its original place. The words, to the music of 'The Girl I Left Behind Me' are:

I take that girl, that pretty little girl,
The girl I left behind me,
And pass right through, and balance too,
And swing that girl behind me.

The words fit the movements.

## GOOD PROMPTING

This requires an intimate knowledge of music and dance construction; a good clear voice properly pitched for the acoustics of the room; a ready faculty for introducing changes as circumstances may require, and an exact sense of rhythm which will enable him to complete the call just before the strain of music begins to which the movement belongs. A good prompter if instructing a dancing class will see to it that in square dances the more experienced dancers are placed as head couples, and the others as side couples that they may have the advantage of observing others before beginning the movements themselves. The prompter should take his position at the head of the hall near the orchestra. The intelligence, ability, experience and courtesy of the prompter have very much to do with the character and enjoyment of the dance.

More terms used in the Old American Dances will be published in next week's issue.

---

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Dearborn Publishing Company, Dearborn, Michigan.

Please order by number.

1. Grand Pa's Favorite
2. Sicilian Circle
3. Virginia Reel
4. Medley Waltz
5. Medley Two Step
6. Varsovienne
7. Rye Waltz
8. Oriental Lancers
9. Heel and Toe Polka
10. Old Southern Schottische
11. Money Musk
12. Badger Gavotte
13. Waltz No. 2
14. Ripple
15. Ticknor's Quadrille
16. My Queen Medley Waltz
17. Luxemburg Schottische
18. Sea Side Polka
19. Club Quadrille
20. Day Break Waltz

# A Dog Molded a Man's Career

By H. T. COOK

MANY strange circumstances have led men into divergent careers, but the strangest perhaps is that of Bernhardt Wall, an artist and collector of rare books and antiques, who, while blindly groping around for an idea, found his inspiration through a shaggy, awkward dog in a tiny bookshop.

Like most artists and collectors, Wall spent much of his time in art galleries and secondhand bookshops in quest of an idea. He had always had a longing to produce a magazine that was devoted exclusively to etching, something that would vie with the product of the monks in the Middle Ages, and it was with this idea in mind that he frequented the atmosphere of museums and old bookshops.

One day, while browsing over a musty volume in a Lexington Avenue bookshop, his attention was attracted to a shaggy, good-natured dog that came bounding through the quaint old shop in search of his master. Spying the equally quaint owner, the over-joyed canine made a grab for the old man's ankles and playfully began tugging at his trousers cuffs.

'That dog surely loves you,' remarked Wall in admiration.

'Yes,' replied the owner, stooping down and patting the dog affectionately, 'and I love him.'

This, though a very small incident, gave Wall an inspiration—man's eternal friendship for his dog—and brought to mind Senator George Graham Vest's immortal plea for dogs.

Having hit upon a theme, Wall hurried home to develop his idea. After tremendous and continuous labor, he brought forth his first all-etched book, *Man's Best Friend*. The book contained fifteen etchings of 'Chris,' the bookshop dog. The entire edition of 125 books was sold in a few months.

Encouraged by the success of this book, Wall now began work in earnest on an all-etched magazine. The monthly was an innovation in the field of literature and art, and was accorded an immediate welcome by book lovers. The first volume contained twelve numbers, and such men as George Barr McCutcheon, President Harding, Edwin Markham, the poet; Hervey Allen, Martha McCullough Williams, Joseph Hergesheimer, Judge Edgar J. Lauer, and Charles Dexter Allen contributed to the etched monthly.

Wall's all-etched magazine was limited to 125 subscriptions and the price was $50 a year, perhaps the most expensive periodical ever published. The magazine at the present time is published quarterly.

'I often laugh when I think of my early art experiences,' said Wall. 'I have never got away from the art field. If I painted a fence, it had color. If I trimmed rose bushes, it was done with effect. I have photographed, lithographed, engraved, designed interiors, costumes, calendars, post cards, posters, and what not.'

As a youth Wall engraved the largest vignette on stone, 'The School of Athens,' after Raphael, consuming thirty days. At the age of 18, he tramped from New York City to Texas. He picked cotton and farmed on the Colorado River 'Bottoms.' Previous to this, he had drifted into the Indian Territory where with many narrow shooting scrapes and 'Shiverees,' and all that goes with them, he found this a bit too strenuous, and so tramped back to Texas with sketch book, always searching for and noting the unusual.

'At Waco, Texas,' continued Wall, 'I once saw a most artistic bridge. Appealing so strongly to me, I made a rough sketch of it before nightfall and incidentally had to sleep under it for the night. Upon starting on my journey the next morning, a woman artist driving by gave me a lift. The next year, while in San Antonio, I helped to organize the San Antonio Art League of which I was later chosen president. The league is still going strong.

'The artist who had given me the lift had been equally charmed by that quaint rustic bridge, and when, a few months later, the Cotton Palace held its annual art exhibition at Waco, I was surprised to find a water color of the bridge entered by my benefactress. Being one of the three judges appointed to choose the prize pictures of the exhibit, my sentiments naturally leaned toward this. It was really well done and I had little difficulty in convincing the other two judges that it was worthy of recognition. Thus it came about that the picture was awarded a medal. The young woman never knew that I had figured in the decision.'

Having satisfied youth's insatiable appetite for experience in the West, Wall drifted eastward, returning to New York just as war was declared against Spain. Roughing it in the open had given him a robust physique and he hastened to enlist, being the first accepted in his regiment. He served in Cuba with the 202nd New York Volunteer Infantry Regiment. He sketched the *Maine* before she sank so deep into the mud of Havana Harbor. In 1913 he witnessed the burial of the *Maine*.

Wall has added many etched books to his original 'Dog' book. He has also illustrated many books for noted authors including the following: 'One Midnight with Roosevelt'; Edwin Markham's 'Lincoln, the Man of the People'; 'The Laughter,' by Clement Wood; Browning's 'Love Among the Ruins'; a ship book by J. Duncan Gleason, called 'Windjammers'; 'Eugenie, 1920,' by Vera Bloom; 'To Hub, My Dog,' by the late President Harding; 'Lincoln's Gettysburg Speech,' 'Three Pierrot Poems,' by William Griffith; 'Washington Irving Footprints,' by Virginia Lynch; 'The Russian Players in America,' by Oliver M. Sayler, and 'Oberammergau,' the prize poem, by Leonora Speyer.

He has sketched from life many of the notables of the world, including Roosevelt, Wilson, Foch, Briand, Clemenceau, Coué, Edwin Markham and Frank Bacon.

Wall prides himself on having the smallest publication plant in the world. All told it is 6 by 8 feet, yet tiny as it appears, it is most complete and some of the most exquisite and expensive books are being etched, printed, and bound there.

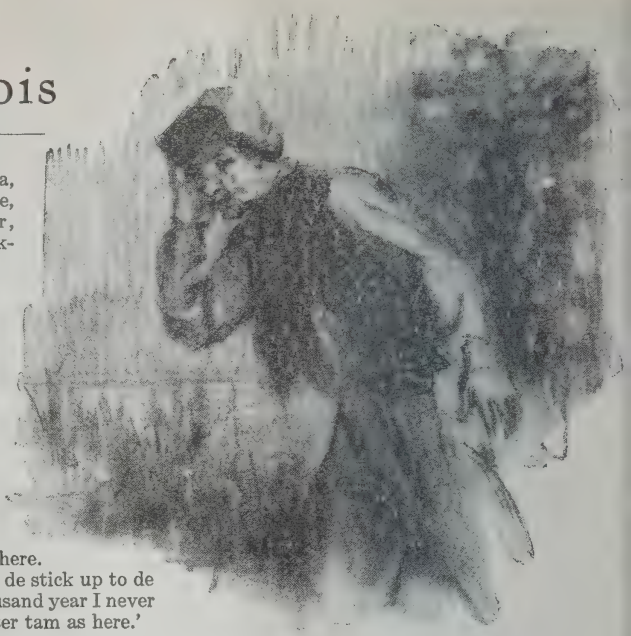
And Bernhardt Wall gives a faithful, lovable dog the credit for his beginning.

# Pere Gilbault, le Coureur des Bois

(*Continued from page 8*)

sea gulls dip into the harbor for herring; his back-to-the-world of buildings. I asked him when he came to this country of Little Traverse.

'When I come here—dees place?' he replied. 'I b'lieve I come here since 1843. Don't seem dat long I come here—seem 'bout ten year 'go I come here.' Then he was dreaming again.



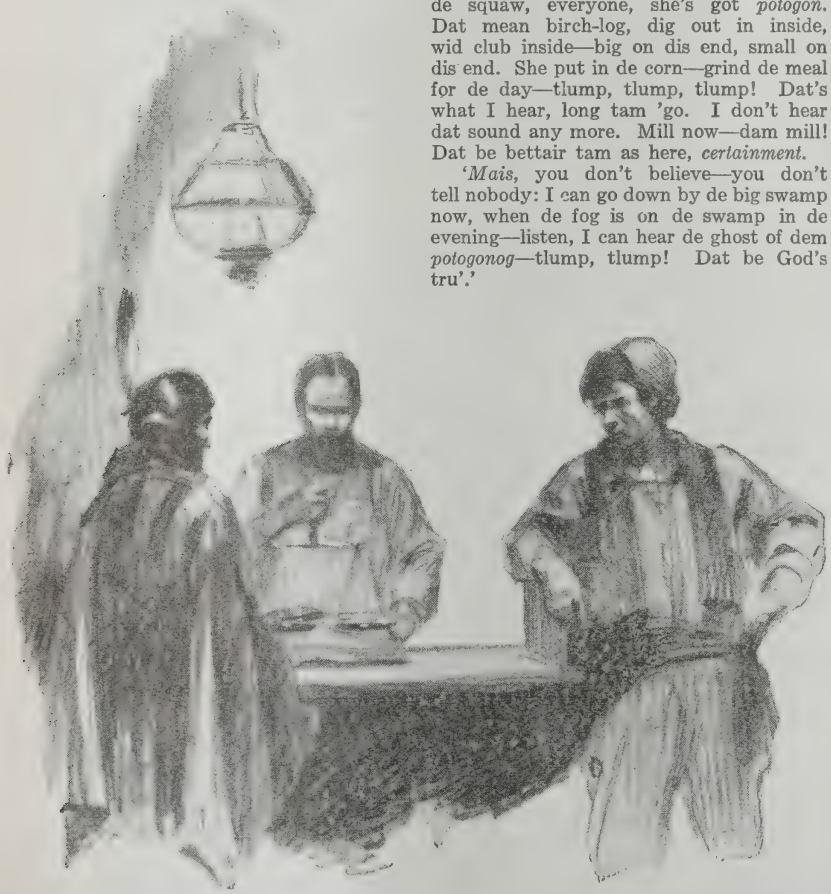
'What was here when you came here, Monsieur?' I asked him.

'What is here—dees place? O, cedar-tree, dat's all; mebbe few Injun house by de Cat'lic church dare.'

'Wasn't it lonesome here in those days?' I knew his answer would be:

'I don't remembair dat very much. Dat be better tam for de Frenchman as here, I tell you. I'm gov'ment carpentair—I build de firs' schoolhouse for de Injun, also de ol' church dare. I get my pay every six mon's, by de gov'ment cuttair. By Gar! dat same boat stand out dare now—de *Mich'gan!* She's buil' 1843; 1844 she come here pay de Injun twenty dollair gold, everyone—de man, de squaw, de pappoose. (I tell you it pay to raise fam'ly dem day.) I find ten-dollair gold-piece on de street some tam. I don't find many now-days.

'I never forget dat tam. Dese Injun come from Minnesota, Wisconsin, Nord-shore, Manitoulin, Detour, Beaver Island, Frankfort, Charlevoix—dey come in de *canot* to get dere money Petite Traverse. Dey come round de Point, pull dere canot up on de sand like finger, pile up some little stick, buil' fire, set round de fire, smoke dere pipe. Light shine in dere face—black hair, red blanket. Sun go down over dare; star shine up here. Lil' blue smoke go from de stick up to de star. By Gar! I live t'ousand year I never forget dat! Dat be better tam as here.'



'I can go down by de big swamp now.'

THE GHOST-MILL

'Long tam 'go—'bout three 'clock in de morning—three 'clock to nine 'clock—when de mist is on de bay dare, I hear strange sound come 'cross de bay from Petoskey: "tlump, tlump, tlump! tlump-tlump!"—sound like partridge drum on log; like gun shoot far 'way. You know what it is? I tell you. De Injun dat tam—de squaw, everyone, she's got *potogon.* Dat mean birch-log, dig out in inside, wid club inside—big on dis end, small on dis end. She put in de corn—grind de meal for de day—tlump, tlump, tlump! Dat's what I hear, long tam 'go. I don't hear dat sound any more. Mill now—dam mill! Dat be bettair tam as here, *certainment.*

'*Mais,* you don't believe—you don't tell nobody: I can go down by de big swamp now, when de fog is on de swamp in de evening—listen, I can hear de ghost of dem *potogonog*—tlump, tlump! Dat be God's tru'.'

'Ma Gawd! Quarter pound silver for quarter pound tobacco!'

THE PAY-DAY

I asked this loyal friend of the Indian if the Chippewas made good use of their government allowance.

'*Oui,* for somebody. Where dare is mouse dare is hawk. I see Injun one tam, he want quarter-pound tobacco. De merchant, he's got what you call lil' balance-scale. He put de plug tobacco in one de saucer, den he put Injun silver in de opposite—when she tip down he say, "Dat's all right." Ma Gawd! Quarter pound silver for quarter pound tobacco! I see dat my eye. I feel sorry dem Injun. Dey don't know dollair from ten-cent piece. Dey have not left price of drink to go home. One tam I say, "Get ze rope! Get ze rope!" We make dem storekeep' say de pray to Jehov'!'

THE MAIL CARRIER

'You ever hear 'bout de tam I make quick trip to Petoskey, carry de mail?
